MAJOR FORBES's pen is something like a Highlandman's claymore; it cuts in here, there, and everywhere, taking a slice out of one part and a slice out of another, till he has carved a dish fit for the gods—of Ceylon. This is, indeed, a very miscellaneous account of a very important and interesting colony. The field-sports bear the largest proportion in the contents; the natural history is very slight; the antiquities, inscriptions, &c. deserving of re-

gard, and the retrospects of ancient history, of 2300 years, and antecedent legends, such as are likely to please readers hitherto uninformed on these subjects. Mr. Turnour's labours, to the value of which the *Lit. Gaz.* has borne testimony, are cordially acknowledged; and we rejoice to see it stated that the prospects of this once populous island are of the brightest hue, and that the improvements introduced by the British government, particularly during the time of Sir Robert Wilmot Horton, are fast increasing its resources, and increasing the happiness of its inhabitants.

We will not enter into the details, either of the British wars by which it was conquered or of the reigns of its many kings, and their deeds of rapine and blood; or of the superstitions of its early fables, or even of elephant-shooting and other gallant sports; but, by selecting a few passages which relate to matters of general information, endeavour to afford our readers some idea of the work.

Major Forbes, in mentioning the *castes* in Ceylon, says, "I shall pass to the outcast Rhodias who have inherited the dreadful punishment to which their remote ancestors, either for sins or misfortunes, had been condemned. These punishments, after enduring for upwards of two thousand years, and intended to be perpetual in the posterity of the original victims, are now at an end, as well as the dynasty which established and continued these atrocious cruelties. There are several fabulous accounts of the institution of these outcasts: one generally believed by natives is, that this race were originally the hunters and purveyors of game for the royal table, and that on a certain occasion, having failed to procure game, they substituted the flesh of a child. Another account is, that continuing to eat beef after it was prohibited, was the cause of the disgrace and sufferings of the Rhodias; but treason and sacrilege, if not the original crimes for which they were condemned, are certainly those which in later times have continued or increased the numbers of the outcasts. About the middle of the eighteenth century, the sacrilegious act of one was made the excuse for degrading a whole family of rank to the situation and community of Rhodias. This punishment, considered worse than death, was only adjudged to those of the highest rank, who it might be supposed would feel the full extent of a punishment intended to be interminable to the race of those condemned. Rhodias were not allowed to build a house, but were forced to live in sheds without any wall, and open at one side; they could not possess or cultivate lands; they were prohibited from approaching a temple; their touch was contamination, and they might be killed with impunity. Two Rhodias, who were hanged for murder at Kandy in 1834, repeated some Pali hymns immediately before their execution, which shews that this unfortunate race had cherished the Buddhist religion, although abandoned by its teachers, and excluded from its temples.\* When the crops of a village had been reaped, and cleaned in the threshing-floors of the field, the Rhodias generally received a small portion of paddy as a gift from each of the cultivators; the alms thus given with the semblance of charity, was intended by the donor as an insurance against aggression on his property, or injury to his family from the practice of *hunaim* (witchcraft)

by the outcasts; and the most liberal of the villagers was likely to have fewest sudden deaths amongst his cattle, which fed in the forests where the Rhodia *cupaya* (hamlet) was established. On one occasion a Rhodia, irritated at the small quantity of paddy bestowed on him by a proprietor, took up the stinted allowance, and, advancing to the threshing-floor, deliberately sprinkled the handful over the large grain-heap of the churl, whose property was thus rendered useless. A complaint having been made to a British authority, the cultivator was told in what manner he might obtain redress, but any form of legal proceeding seemed to him derogatory to his dignity when a Rhodia was his adversary. Finding that his offer 'to shoot the outcast' was rejected, and being moreover informed that such an act would certainly bring him to the gallows, the cultivator walked off, apparently resigned to the loss of his rice, and, no doubt, wondering at the value which a foreign nation ignorantly placed on the life of a Rhodia. Under the native dynasty the Kandian gaoler appointed some low-caste person, generally a charcoal-burner, to communicate orders to the Rhodias,—for the government which sanctioned their persecution was mean enough to profit by the labour of people whom it would not protect, and compelled them to furnish ropes of hides for the purpose of catching elephants. They were fortunetellers; and this circumstance, conjoined with the good looks of their women and the activity of the men, who made ropes, whips, and other useful articles, was the cause of Rhodias being less oppressed than was intended by the cruel lawgiver who established their position beyond the pale of society."

Again:—

"The Veddahs are an uncivilised race, thinly scattered over an extensive unhealthy tract of country, lying between the maritime province of Batticaloe on the eastern coast, and the Kandian hills. They are the descendants of Yakkas, the aboriginal inhabitants, who were in possession of the eastern part of Ceylon when Vigeya and his followers landed B.C. 543; and, having then escaped from the fury of these invaders into the depths of the forest of Bintenne and Veddaratta, have there preserved the purity of their race and the superstitions of their ancestors. All Veddahs are considered to be of the Goyawanzae (the highest caste now existing in Ceylon); and such of them as I have seen do not in any respect differ from what other natives would become, if compelled to use the same exertions, to endure the same privations, and, like them, to live as wanderers in a forest-wilderness. The village Veddahs have permanent places of residence, cultivate small portions of land, and communicate, although they do not mix, with the other natives of the island. The forest Veddahs subsist by hunting, or on such fruit as the earth yields spontaneously; and they obtain arrow-blades, the only article of manufacture which they covet, through the intervention of their own headmen and their brethren of the villages. Their headmen (Kandians of the neighbouring districts), in talking to Europeans, generally exaggerated the wild nature of the Veddahs; and never endeavoured to amend the habits, extend the comforts, or improve the appearance, of these poor people. This is easily accounted for; the less civilised the Veddahs were, and the less they were known, the more easy it was for those in authority over them to impose on their credulity, and thus obtain for a trifle ivory and dried deer-flesh, the produce of their bows. This race has, perhaps, the scantiest

measure of covering of any people who know the use of cloth and pretend to wear it; their whole dress consisting of a small piece of cotton cloth depending in front from a string tied round the loins. The Veddahs 'have a curious way by themselves of preserving flesh: they cut a hollow tree, and put honey in it, and then fill it with flesh, and stop it up with clay, which lies for a reserve to eat in time of want.' The Veddahs may more properly be termed rude than savage, being as free from ferocity as from any trace of civilisation. Their present state is an inheritance from their ancestors, who, driven by oppression and treachery into solitudes, had to suffer hardships, under which they retrograded to the condition in which we now find them, and in which they have continued for more than twenty centuries. I cannot in any other manner account for the extraordinary fact of a people declining into the lowest state of mental debasement, accompanied by the endurance of bodily hardship, and thus continuing for so many ages, although acknowledged to be equal in rank with the best of a comparatively civilised nation, in the midst of whom they lived, and with whom they possessed a common language. The cruel and perfidious conduct of the Singha race of conquerors naturally inspired the Yakkas with feelings of terror and distrust, which in after-times were maintained in their descendants by continued acts of violence of the Cingalese towards the Veddahs. The different families of the forest Veddahs are said to preserve boundaries in the woods, and only within their respective limits to kill the game which is their principal food. Without any regular religion, the Veddahs (like every other untutored race) feel the force of an invisible and superior power, which evinces its influence by undefined terrors, and the consequent belief and worship of evil spirits: they also make offerings to the shades of departed ancestors, and to figures temporarily prepared to represent the controlling spirit of some planet which they believe to exercise an influence over their fate. During the Kandian dynasty, the Veddahs paid tribute in wax and elephants' tusks, and obeyed headmen from the adjacent districts; afterwards, by the influence of these persons, they were led, in 1817, to join the rebellion raised against the British government. The weapons they use are clubs, and bows with arrows, the blades of which vary in length from four to fifteen inches: it is with these long-bladed arrows and wretched bows that Veddahs kill elephants, not by striking in the foot as was commonly believed, but by creeping close up to the animal and shooting to the heart. Should the elephant have escaped receiving a mortal wound, the hunters follow his track and persevere until he falls exhausted, or by a fresh attack, when, in addition to the ivory, they recover their arrows. Activity saves them from danger in this pursuit; and so cautious and stealthy is their pace, that they seldom startle any game which it is their object to approach: from this cause the Cingalese have obtained the belief that no wild animal will fly from a forest Veddah."

Compulsory labour being now repealed, it will follow that this class will again rise in the human scale.

The Delada festival, in which a tooth of Buddha performs the part of St. Januarius's blood, and other relics, nearer home, is a curious exhibition of great pomp and ceremony; and some features of the existing worship is hardly less strange.

"The malignant spirit called Ganga Ban-

\* Dr. Davy mentions a solitary instance of which he had heard, of a Buddhist priest preaching to the Rhodias, for which, having incurred the royal displeasure, and on being rebuked by the king, the teacher replied, 'Religion should be common to all.'

dera, Oya Bandera, Oya Yakka,\* &c. is properly an object of terror, not of worship; and under very many different appellations the identity is easily perceived: he is the representative or personification of those severe fevers to which, from some occult causes, the banks of all Ceylon rivers are peculiarly liable. The manner of making offerings to the Ganga Bandera is by forming a miniature double canoe, ornamented with cocoa-nut leaves so as to form a canopy: under this are placed betel, rice, flowers, and suchlike articles of small value to the donor, as he flatters himself may be acceptable to the fiend, and induce him to spare those who acknowledge his power. After performing certain ceremonies, this propitiatory float is launched upon the nearest river: in a sickly season I have seen many of these delicate arks whirling down the streams, or aground on the sandbanks and fords of the Ambanganga. The ceremony with which the ashes of Cingalese kings were consigned to supposed annihilation in the waters of the Mahawelli-ganga seems to have been derived from these rites, and was admirably adapted to perpetuate the feelings of mystery and awe which it was the policy of Ceylon monarchs to maintain when alive, and after death to transmit to their successors. The body of a Cingalese king was burnt with many ceremonies; and the fire, kept up until the tenth day, was then extinguished. The fragments of bones were next collected, and buried (together with certain offerings made during the ceremony) at the spot where the monumental dāgoba was to be raised. The ashes, enclosed in an earthen urn, were consigned to a man dressed in black, wearing a mask, and mounted on an elephant: he then headed the procession, and was followed by all the chiefs and people in funeral array to the Mahawelli-ganga. On arriving at the river, the mask descended from his elephant; and bearing in one hand the urn, in the other a drawn sword, embarked in a double canoe ornamented with plantain-trees and cocoa-nut flowers. The vessel having been towed into the middle of the river, the mask held up the urn, cut it in two with the sword, then dived into the river and disappeared. The royal dust of the 'race of the sun' vanished in the waters; the frail and gaudy vessel drifted to destruction; the elephant, removed across the river, was never again to be used; and the people (who had collected the ashes), conveyed to the opposite side, had the penalty of death attached to their return. Part of these extraordinary funeral rites are alluded to in an inscription cut on a rock at Polannarrua, of the date A.D. 1200, thus:— 'After the demise of Nissankha-malla, who formerly reigned in Ceylon, and subsequent to the immersion (of the ashes) of a number of kings who succeeded him, and had, like so many diminutive stars, twinkled after the sun had gone down.' The religion of Ceylon is properly that of Gautama Buddha; but his moral system is there found to be conjoined with the ancient superstitions of the aboriginal inhabitants, who never entirely abandoned the adoration of gods, demigods, devils, ancestors, and planets. Although demon worship is repugnant to the doctrine of Buddha, yet its unhallowed rites were always maintained either openly or in secret: it is probably in consequence of the decline of Buddhism that the devils' priests had become more audacious, and that of late their ceremonies have

increased in favour with the Kandian people. The Buddhists of Ceylon believe that, in periods of great moral depravity and mental debasement, a Buddha in prospect (a being who, by meritorious actions and blameless purity in his later transmigrations, had reached the most exalted of the heavenly mansions), became incarnate to fulfil his own final transmigration; whilst at the same time he regenerated mankind, and restored religion. The twenty-fifth of those Buddhas whose names are preserved, and the fourth of the present Kalpa, or great period of moral renovation, is the Gautama Buddha now worshipped in Ceylon. \* \* The scanty details of the earlier Buddhas are involved in the obscure theories or fictions in which Buddhists describe the form and duration of the universe, and the multiplied incarnations of Buddhas. In some of these works we find the calculations and dates to consist of numberless figures; and that the statements and descriptions are an interminable labyrinth of absurdities, seemingly without object, and certainly without amusement; some of these reveries appear to be the production of an unbridled fancy, whose only care had been to abstain from aught probable, possible, or comprehensible; adhering to the orthodox Buddhist text:— '*Thus the Buddhas are incomprehensible, their doctrines are incomprehensible, and the magnitude of the fruits of faith to those who have faith in these incomprehensibles is also incomprehensible.*'"

[To be concluded next week.]

*Lyra Urbanica; or, the Social Effusions of the celebrated Captain Charles Morris, of the late Life-Guards.* 2 vols. 12mo. London, 1840. Bentley.

"ADIEU to the world! where I gratefully own  
Few men more delight or more comfort have known:  
To an age far beyond mortal lot have I trod  
The path of pure health, that best blessing of God;  
And so mildly devout Nature temper'd my frame,  
Holy Patience still soothed when Adversity came.  
Thus, with mind ever cheerful, and tongue never tired,  
I sung the gay strains these sweet blessings inspired;  
And, by blending light mirth with a moral-mix'd stave,  
Won the smile of the gay and the nod of the grave.  
But, at length, the dull languor of mortal decay  
Threw a weight on a spirit too light for its clay;  
And the fancy, subdued as the body's oppress,  
Resigned the faint flights that scarce wake in the breast.  
A painful memento that man's not to play  
A game of light folly through Life's sober day:  
A just admonition, though view'd with regret,  
Still blessedly offer'd, though thanklessly met.  
Too long I, perhaps, like the many who stray,  
Have upheld the gay themes of the Bacchanals' day;  
But at length Time has brought, what it ever will bring,  
A shade that excites more to sigh than to sing.

In this close of Life's chapter, ye high-favour'd few,  
Take my Muse's last tribute—this painful adieu!  
Take my wish, that your bright social circle on earth  
For ever may flourish in concord and mirth;  
For the long years of joy I have shared at your board,  
Take the thanks of my heart—where they long have  
been stored;  
And remember, when Time tolls my last passing-knell,  
The 'old bard' dropp'd a tear, and then bade ye—  
'Farewell!'"

Thus sung Captain Morris in his eighty-sixth year, addressing a parting word to his beloved companions of the old Beef-Steak Society; and even to the age of ninety the vocal swan poured forth his notes; and sweetly too, as may be judged by the following stanzas to the same social brotherhood when they prevailed upon him to revisit them, and receive a testimony of their friendship before he quitted the world:—

"Well, I'm come, my dear friends, your kind wish to obey,  
And drive, by light Mirth, all Life's shadows away;  
To turn the heart's sighs to the throbbings of Joy,  
And a grave aged man to a merry old boy.

"T is a bold transformation, a daring design,  
But not past the power of Friendship and Wine;  
And I trust that 'en yet this warm mixture will raise  
A brisk spark of light o'er the shade of my days.

The swan, it is said by the poets, still tries  
To sing, if he can, a last song ere he dies:  
So, like him, my dear brethren, I'll do what I can,  
Though th' attempt savours more of the goose than the swan.

When I look round this board, and recall to my breast  
How long here I sat, and how long I was blest,  
In a mingled effusion, that steals to my eyes,  
I sob o'er the wishes that Life now denies.

"T was here my youth, manhood, and age used to pass,  
Till Time bade me mark the low sands in his glass:  
Then with grief that alone Death can hide from my view,  
I gave up the blessing, and sadly withdrew.

But my sorrow is soothed, my dear friends let me say,  
As your 'tribute of friendship' I proudly survey,  
That my heart can yet glow with the joy it reveals,  
And my tongue has yet power to tell what it feels.

How many bright spirits I've seen disappear,  
While Fate's lucky lot held me happily here!  
How many kind hearts and gay bosoms gone by,  
That have left me to mingle my mirth with a sigh!

But whatever be the lot that Life's course may afford,  
Or howe'er Fate may chequer this ever-loved board,  
So the memory of Pleasure brings Sorrow relief,  
That a ray of past joy ever gleams o'er the grief.

And still in your presence more brightly it glows:  
Here high mount my spirits, here always they rose;  
Here a sweet mingled vision of present and past  
Still blesses my sight, and will bless to the last.

When my spirits are low, for relief and delight,  
I still place your splendid memorial! in sight;  
And call to my Muse, when Care strives to pursue,  
'Bring the steaks to my memory, and bowl to my view.'

When brought—at its sight all the blue devils fly,  
And a world of gay visions rise bright to my eye,  
Cold Fear shuns the Cup where warm Memory flows;  
And Grief, shamed by Joy, hides its budget of woes.

'Tis a pure holy fount, where for ever I find  
A sure double charm for the body and mind;  
For I feel, while I'm cheer'd by the drop that I lift,  
I'm blest by the motive that hollows the gift.

Then take, my dear friends, my best thanks and my praise,  
For a boon that thus comforts and honours my days;  
And permit me to say, as there's Life in a bowl,  
That Taste forms its body, but Friendship its soul."

There is a great disadvantage in putting together so many compositions by one hand, and on similar themes. Unlike lyrical collections by a number of writers, there must of necessity be a sameness of thought and expression, and a general want of variety in the ideas bestowed upon the pleasures of the table, wine, friendship, and love. Yet throughout all this mass there is a vein of mingled mirth, sweetness, and sentiment; and it is studded with numberless pretty and pleasing images, enlivened by gaiety of heart and spirits, and, above all, imbued with a social humanity, which is the grand recommendation of the whole. That these qualities flowed naturally from the happy temperament of the author is fairly demonstrated by his reaching an epoch of life so far beyond the common lot of man, and enjoying himself to the last. Some of his warmer effusions have of course been found to be ineligible for publication; and, indeed, a few which live in the recollection of his associates can now only be thought of as partly pardonable on account of their sparkling wit and daring humour. From what we have before us we will select a specimen or two; and with them recommend the *Lyra Urbanica* to the lovers of song, good-fellowship, and harmony. Our first is a charming anacreontic:—

"To my Cup.

"Come, thou soul-reviving cup!  
Try thy healing art;  
Stir the fancy's visions up,  
And warm my wasted heart.  
Touch with freshening tints of bliss  
Memory's fading dream;  
Give me, while thy lip I kiss,  
The heaven that's in thy stream.

As the 'witching fires of wine  
Pierce through Time's past reign,  
Gleams of joy, that once were mine,  
Glimpse back on life again;

\* "A large and elegant silver bowl, with an appropriate inscription, presented by the Society as a testimonial of affectionate esteem."

\* "The river king, prince, or devil, the washerman's stand, the water-stand, are some of the names given to the visible signs of sickness that sometimes follow the course of running water in Ceylon."

And if boding terrors rise  
O'er my melting mind,  
Hope still starts to clear my eyes,  
And drinks the tear behind.  
Then life's wintry shades, new drest,  
Fair as summer seem;  
Flowers I gather from my breast,  
And sunshine from the stream.  
As the cheering goblets pass,  
Memory culls her store;  
Scatters sweets around my glass,  
And prompts my thirst for more.  
Far from toils, the great and grave  
To proud ambition give,  
My little world kind Nature gave,  
And simply bade me live.  
On me she fix'd an humble art,  
To deck the Muse's grove;  
And on the nerve that twines my heart  
The touch of deathless love.  
Then, rosy god, this night let me  
Thy cheering magic share;  
Again let hope-fed fancy see  
Life's picture bright and fair.  
Oh! steal from care my heart away,  
To sip thy healing spring;  
And let me taste that bliss to-day  
To-morrow may not bring."

"The Toper's Apology" is still more vivid, and not less poetical; but it is too long to be included in our quotations, and we only insert three of the stanzas:—

"My Muse, too, when her wings are dry,  
No frolic flight will take;  
But round a bowl she'll dip and fly,  
Like swallows round a lake.  
Then if the nymph will have her share,  
Before she'll bless her swain;  
Why that I think's a reason fair  
To fill my glass again.  
In life I've rung all changes too,  
Run every pleasure down,  
Tried all extremes of Fancy through,  
And lived with half the town;  
For me there's nothing new or rare,  
Till wine deceives my brain;  
And that I think's a reason fair  
To fill my glass again.  
Then, many a lad I liked is dead,  
And many a lass grown old;  
And, as the lesson strikes my head,  
My weary heart grows cold.  
But wine, awhile, holds off despair,  
Nay, bids a hope remain;  
And that I think's a reason fair  
To fill my glass again."

Here is another morsel from "*Toujours gai*":—

"They tell me I'm old—well, for that must I bear,  
Because my strength's less, greater burthen of care?  
Must eyes, because dimmer, do nothing but weep?  
Or legs that can't gallop, do nothing but creep?  
Yes, they say, 'Age looks best in the semblance of  
Grief,  
And if Pleasure pursue, you should hide like a thief;  
No glow of the fancy should heat the cool head,  
And the heart, through all life, to the world should be  
deaf."

What malice could draw from the tongue of the sage  
This splenetic sentence, thus passed upon Age?  
When life charms my heart, must I kindly be told  
I'm too gay and too happy for one that's so old?"

The Catalogue "*'Tis a Bit of a Thing*," is so well known to need our praise; and we pass to a very sound piece of advice, though couched in a song:—

"Take a hint, my dear brethren who wish to be gay,  
Beware of all ill-sorted souls;  
Ne'er trust to strange bosoms your good-humour'd play,  
But sit with tried friends round your bowl.  
Wine often awakes feld'n Complacency's smile,  
When the heart with malignity burns;  
For a fifth of mankind have so acid a bile,  
That the cordial to vinegar turns.  
Sad blights on Life's sweets from this cause have I  
known;  
And many a wretch have I seen,  
Who close shut his breast as you open'd your own,  
Yet variat'd with slumbers his spleen.  
Then fly, if you can, all this pale-liver'd race,  
Allow not the venom to breed;  
They're reptiles that ever Life's blossoms deface,  
And live on the canker they feed.  
No eagle-eyed sharpness there needs to deary  
These tempers, though practised in guile;  
Truth sits in the half-scowling glance of their eye,  
And the grin of their pleasureless smile.  
Beware then, beware while the poison ferments,  
Avoid the black fumes as they rise;  
Nor sit till the heart, in loud quarrel, laments  
That it wasn't both merry and wise."

These are the gowls of society, who revel upon the generous, prey upon the unwary, and calumniate the unfortunate. Let none such be trusted. We believe that even Morris himself had some taste of the ingratitude and want of sincerity in the world. But, to the end, he could laugh these things to scorn, and make a jest of his very infirmities. Witness,—

"The Veteran Bacchanal.  
I am an old Bacchanal, quite worn out,  
Once leader of many a jolly bout,  
But the game's all up, and the show's gone by,  
And now an old bore and a twaddle am I.  
Sad proof my body and mind could bring  
That it's time to cut, and move out o' the ring:  
The proofs are too many, alas! by far;  
But a few are sufficient, and here they are.

When I try to sing I but hawk and hem,  
Through a choking struggle of husky phlegm;  
Half-strangled, I hack it out bit by bit,  
And my chorus is always a coughing fit.

I try to joke, but my memory fails,  
And ten times over I tell old tales;  
But I tell them, alas! to stones! I the wall  
For no one, I find, ever listens at all.

When I see folks laughing I cock my ear,  
But of all that's said not a word I hear;  
And if upon paper the joke should be,  
My eyes so water I nothing can see.

When I take my wine I've a hiccupping bout,

When I take my seat, be it where it will,  
While others are warm, I am always chill;  
And wherever I'm placed, I'm sure to find  
That an air comes in on my neck behind.

A warning shadow on Mirth I lie,  
And when I'm off it's a cloud gone by;  
To all live spirits, that charm the room,  
I'm a death's-head lesson of what's to come.  
So I'll bid farewell to the jovial scene,  
Where a fading figure should ne'er be seen;  
I'll take a hint from my warning cough,  
Quit my jade of a Muse, and—*Morris off!*"

And so do we!

#### MISCELLANEOUS.

*The Prophet of the Caucasus: an Historical Romance of Krim Tartary.* By Edward Spencer, Esq. author of "*Travels in Circassia*," &c. 3 vols. 12mo. London, 1840. Whittaker and Co.

MR. SPENCER has fair examples before him in Morier, Baillie Fraser, and others, for first giving us a book of travels in an interesting country, and then working up his other materials and observations into the form of a historical romance. We do not think, however, that he has been equally fortunate in his choice of subject; which, though highly important, seems rather to have been suggested by a desire to exhibit the cruel and encroaching ambition of Russia, than by its immediate fitness for such a mode of treatment. The history of the conquest of the Crimea is recent, and full, and familiar, and Catherine, Potemkin, and the other chief actors, no less so. Nevertheless, our author has exhibited a noble patriot in his mighty Prophet; and his sketches of the court of the Khan, and the events which led to his utter subjugation, are very characteristic and spirited.

*A Dictionary of Printers and of Printing, with the Progress of Literature, Ancient and Modern. Bibliographical Illustrations, &c. &c.* By C. H. Timperley. Double columns, 8vo. pp. 996. 1840. London, Johnston; Edinburgh, Fraser and Co.; Glasgow, Symington and Co.; Dublin, Curry and Co.; Manchester, Baucks and Co.

On first glancing at the title of the above work, we supposed it to be one of considerable use to the practical printer. Such, however, it is not; but as containing a history of the progress of letters from the earliest period, of events connected with the art of printing, and of the most eminent in all countries who have taught and

practised it, the volume is of infinite value, not only to the printer, but as a work of reference for those who adorn the literature of our country. Much, indeed, may be said in praise of Mr. Timperley's diligence, of his devotion to the task of collecting a mass of matter so great, and of his seeing it so creditably through the press; to accomplish which he never neglected his labour as a journeyman printer, but employed those hours only which are generally appropriated to rest. The facsimiles of types and devices used by Caxton are interesting and curious; and the whole work, we repeat, highly creditable to its writer. We may as well observe that our copy is imperfect, having a duplicate of one half sheet, and a deficiency of the first eight pages of the index.

*The Sideral Heavens, and other Subjects connected with Astronomy, &c. &c.* By Thomas Dick, LL.D., author of "*Celestial Scenery*," &c. Pp. 584. London, 1840. Ward and Co.

A POPULAR work on astronomy, in which the author addresses himself to general students rather than to scientific readers; and he further improves his design by turning the thoughts of all towards the Omnipotent Deity, whose works he describes as far as they are cognisable by human faculties.

*The History of British India.* By James Mill, Esq. Fourth Edition, with Notes and Continuation by H. H. Wilson, M.A. F.R.S. Vol. II. 8vo. pp. 327. London, 1840. Madden; Lewis.

THE continuation of this sterling work proceeds regularly; and being one, the value of which is universally acknowledged, we need only notice the fact of its appearance.

*The Pulteney Library.* Nos. I. II. III. IV. V. *The Works of De Foe.* 8vo. (London, Clements).—Well got up at a very low price. The works—generally speaking too little known and read now—of De Foe are really a welcome addition to this kind of periodical literature. "Colonel Jack" and "Moll Flanders" are completed, "The Adventures of a Cavalier" commenced, and six of the author's political essays already comprised in these five numbers. The works are a correct reprint of the edition edited by Sir Walter Scott, and are carefully annotated by Mr. W. Hazlitt.

*British Genius; or, the Reign of Youth,* by the Rev. R. Kennedy. Pp. 97. (London, Saunders and Otley).—A mask on the late royal marriage, and one of the many effusions for the passing day, with which the future day will have little concern or interest.

#### ARTS AND SCIENCES.

##### ROYAL GEOGRAPHICAL SOCIETY.

MARCH 23.—Mr. Greenough, F.R.S. President, in the chair.—His excellency, M. Guizot, late president of the Geographical Society of Paris, was present, and elected a foreign honorary member. The following papers were read.—1. A letter from Mohammed al Kerim, dated Nov. 15, 1839. Communicated by G. A. Hoskins, Esq. This young native of Dongolah, who, after being instructed in this country, was sent out in May last to explore the sources of the Bahr el Abyad, or White Nile, states that he has got beyond Khartum on his way to Dar Fur, and, although he has lost every thing, and is obliged to beg his way as a dervish, is resolved to persevere, and hopes to accomplish the object he was sent out for by the White Nile Association.—2. Journal of Messrs. Isenberg and Krapf, during their route from Zeilah on the eastern coast of Africa, to the kingdom of Shoa and Efat, between April and October 1839. Communicated by the Church Missionary Society; which, however, we must reserve.

##### ENTOMOLOGICAL SOCIETY.

JANUARY 6. The Rev. F. W. Hope in the chair.—Numerous donations of works upon entomological subjects were received from the Natural History Society of Geneva, the Baron

de Romand, Professor Burmeister, Messrs. Blackwall, Westwood, Charlesworth, &c. The President read extracts from a letter received by him from W. S. Mac Leay, Esq., stating the safe arrival of himself and his library and collections in New South Wales; and that he proposed shortly to commence the publication and description of remarkable Australian groups collected by his father and brother. He had been enabled to confirm his views relative to the relation of *Agarista* and *Urania*, two splendid groups of anomalous lepidopterous insects, the species of the former being also diurnal in their flight. —Mr. Westwood announced the capture of a species of the extraordinary genus *Ceraplerus* in South America, being the only species of the family *Paussidae* hitherto discovered in the New World. Mr. Waterhouse exhibited some extremely small varieties of the garden white butterflies. Mr. Hope exhibited some curious coleopterous insects recently received by him from Sierra Leone and New South Wales, including a female of the splendid *Goliathus torquatus*. Mr. Westwood exhibited a living specimen of a beautiful beetle, *Clorus Valvatus*, reared by himself from the nest of a wild bee, *Osmia Muraria*, which inhabits France. The following memoirs were read:—1. 'Description of a new Species of *Trachyderes*,' by Mr. E. Newman. 2. 'Observations upon the Structural Characters of the Death-Watch, with the Description of a New British Genus allied thereto,' by Mr. Westwood. 3. 'Observations on the Economy of Species of Spiders which Inhabit Cylindrical Tubes covered with a Movable Trap-door,' by Mr. Westwood.

January 27.—This was the Anniversary Meeting, at which the council and officers for the ensuing year were elected.

February 3.—The Rev. F. W. Hope (who had been re-elected as President) in the chair; and by whom a large collection of Sicilian insects was presented to the Society. Mr. J. Stevens exhibited a large nondescript and very beautiful species of moth from the interior of Africa; and Mr. Westwood, drawings of a very minute *Acarus* found on the backs of damp books, as well as of the larvæ and pupa of a species of *Lathridius* found in the same situation. Mr. Hope exhibited a Scolopendra of large size, one of the feet of which was of very small size, which had evidently resulted from the reproduction of the limb. The completion of Mr. Westwood's 'Memoirs on Trap-Door Spiders' was read.

March 2. The President in the chair.—A splendid collection of North American insects was presented by Mr. E. Doubleday; numerous donations of entomological works were also announced. A quantity of silk cocoons from the Cape of Good Hope were forwarded by Mr. Dukeford. Mr. Bainbridge exhibited a remarkable monstrosity occurring in *Lucanus Cervus*, one of the mandibles of which was strangely distorted. Mr. Shuckard exhibited a new British genus of bees, *Macropis labiata*, which was captured by Mr. Walton in the New Forest. The following memoirs were read:—1. 'Descriptions of some new *Celonuda* from the Collection of Mr. Hope,' by Mr. Bainbridge. 2. 'Descriptions of *Scolia fulva*, from the same Collection,' by Mr. Shuckard. 3. 'Observations upon Mummy Insects,' by Sir Gardner Wilkinson, communicated, with additional remarks, by the Rev. F. W. Hope.

#### BOTANICAL SOCIETY.

MARCH 20th. Mr. Cowper in the chair.—Read, a paper 'On the Nature of some of the

Lowest Organised Beings,' by Dr. W. H. Willshire, illustrated by specimens exhibited under the microscope, and by various drawings. The views of Ehrenberg, lately advanced in his work "Die Infusions Thiercen," were questioned in regard to several of the *bacillaria*, *closterina*, and others; and even of the subdivision *naiculacea*, Dr. Willshire conceived the animal organisation may be doubted. Self-division, he says, is not confined to the animal, but to be observed also in the vegetable kingdom, and therefore this mode of propagation in such structures as *diatorma*, *fragillaria*, *desmidium*, &c. is not sufficient proof of their animal condition. Besides the granular matter seen within many of these lower beings, regarded by Ehrenberg, in many cases, as ova granules, or the eggs of these creatures, cannot be such, because, as Meyer has observed, in *enastrum* and *closterium* more particularly, they become blue by the action of tincture of iodine; and this fact Dr. Willshire considers an evidence of their vegetable nature. Further, the faculty of locomotion, the author contended, is no proof of animal condition, because the sporules of several *algæ*, when ripe, possess this power, and it occurs in structures acknowledged by Ehrenberg himself to belong to the vegetable kingdom, namely, *oscillatoria*, *syngnema*, &c. Finally, in the present state of knowledge, the attainment of a particular result from the occurrences of motion (more apparent in *navicula* than *oscillatoria*) cannot be proof of animal condition, because the movements of *syngnema*, *vallinaria*, and the motion of many irritable stamens, equally exhibit the like attainment. From these and other views expounded by Dr. Willshire in his erudite essay, he infers the probability of many of the almost invisible organisms, hitherto yielded by the botanist to the zoologist, not possessing sufficient claim to such high distinction, although they may not so decidedly evince vegetable nature as do *diatorma*, *fragillaria*, *desmidium*, *closterium*, and others.

#### PARIS LETTER.

Academy of Sciences, March 24, 1840.

SITTING of March 16th.—M. Serre, Vice-President, in the chair. After some preliminary business, concerning notices of vacancies, &c., M. Flourens communicated the result of his experiments with madder in tinging the teeth of animals. After an alternation of food impregnated with madder and common food, the teeth were found, in the cases of some pigs, to be tinged in alternating layers; but only the bony part of them: the enamel remained untouched. It further appeared, that the first part which became coloured was the inside of the tooth, being the contrary of what took place in the bones; and hence it was inferred that the teeth grew from within, while the bones, on the contrary, received their increment externally.

M. de Humboldt, the secretary stated, had sent to the Academy some specimens of a curious substance, like fine felt, which had been collected on some marshes in Silesia, near Sobor, where the inundations of the Oder had prevailed last year. This substance had become whitened by action of the air and the sun, and proved to be the exuvæ of about fifteen various kinds of infusoria, characterised by M. Ehrenberg. M. de Humboldt also wrote to the Academy, that in certain cretaceous formations in Prussia it had been ascertained, that 19-20ths of the mass of the rock consisted of very small coralliform polythalamie insects and infusoria, out of which three-fourths of the

species were identical with species now living on the shores of the Baltic.

A long memoir was read from M. de Gasparin, on the means of determining the limits, geographical and statistical, of the cultivation of the mulberry-tree, and the production of silkworms. The production of silk, M. de Gasparin observed, was long confined to the eastern parts of Asia, and it was thought impossible to naturalise it on the shores of the Euxine. Justinian, however, introduced silkworms into his dominions in the sixth century; and shortly after, the Peloponnesus became so abundant in the mulberry-tree which was grown there, that it changed its name to the Morea. The mulberry-tree, however, and the silkworm, did not spread further towards the west till 1146; when Roger I., king of Sicily, transported the tree from Athens into his states, whence it ultimately extended itself to Tuscany and the Riviera of Genoa. In 1268, Pope Gregory X. introduced the silkworm, the mulberry-tree, and the art of manufacturing silk, into his state of Avignon. But it was not till 1495, when the French returned from the conquest of Naples, that the mulberry-tree came to be cultivated as far north as Allan, near Montélimar; whence it afterwards spread into the Vivarais and Dauphiny. Henry IV., aided by Olivier de Serre, planted the garden of the Tuileries with mulberry-trees, and introduced the culture of it at Moulins, Tours, Angers, and Saumur. Similar efforts were at the same time made in Switzerland, Bavaria, and Wurtemberg. After determining various conditions, as to heat, soil, light, &c., which are necessary for the success of its cultivation, M. de Gasparin stated his belief that this plant might be acclimated in the neighbourhood of Paris, especially since it had been successfully attempted still further north. It was not the great cold of winter that did harm to this plant, since it could support a maximum cold of - 25 of the centigrade scale, but rather the hoar-frosts that were liable to attack it at the moment of its foliation. The relative advantages of the climate of the south of France and that of Paris, in these respects, might thus be calculated according to the different circumstances of the atmosphere:—

At Orange.		At Paris.	
Heat	100	64	
Light	100	87	
Hoar-frost	81	100	
Rain	100	62	
	381	313	

Hence the relative advantages were as 38 to 31, nearly. Moisture was necessary to the good growth of the tree, and light was especially so. A tree planted in a sunshiny climate had a rounder form, and the leaves were not so long, and were more firm, than those of one planted in a district where the sky was often cloudy. It was known that the leaves of the mulberry-tree grown in shady situations were not so nutritious as those of a tree which had enjoyed much light. The workmen commonly said, that leaves of the former kind gave the silkworms the dropsy; and M. de Gasparin, on drying two such sorts of leaves, and then subjecting them to certain processes, found that those of the former kind retained of solid matter only 27 per cent, whereas the latter had 58 per cent: the difference of light, therefore, produced a difference of 2 to 1 in the value of the leaf for economical purposes. M. de Gasparin stated that, in the course of his researches upon this subject, he had made some curious experiments, in furtherance of others which he had

ascertained had been made at the commencement of the present century, as to the deleterious influence of certain dews upon the mulberry-tree in the Pontine Marshes, and which shewed that dew was sometimes highly injurious to small animals. He had remarked that, at certain periods, a peculiar state of the atmosphere, called the *touffe*, prevailed, the mulberry-trees suffered greatly during the night, and that animals and men also felt an unusual state of languor and uneasiness. He collected, therefore, the dew that fell upon nights when the *touffe* did not prevail, and also upon nights when it was powerful; and he found that, when a north wind blew gently (for if it blew strongly there was no dew), the dew presented all the characteristics of pure water. But when the *touffe* prevailed, and the wind blew from the south, the dew was found to contain a considerable quantity of hydrochlorate of sodium; if it were kept, it emitted, in a few days' time, a decided ammoniacal odour; and if it were thrown upon fire, a strong smell of sea-plants was developed. This dew, when given to sheep, rabbits, and other animals, to drink, produced death. M. de Gasparin pointed out the probable importance of such experiments in determining the causes of certain epidemic diseases prevalent in summer. As to the importance of the cultivation of the mulberry-tree, and the production of silkworms, together with the manufacture of silk dependent upon it, it appeared that in forty-three departments of France, the annual value of these products was 42,000,000 of francs.

M. Dumas read a report upon a memoir by M. Séguin, on the extraction of gas from animal matter for economical purposes. M. Séguin's object was to get rid of the animal refuse matter, which was such serious nuisances in towns when in a state of putrefaction; and he had subjected them to the action of heat in closed cylinders. Many of the products obtained by this distillation of animal matter were of ready use in commerce—such as the ivory-black from bones, and the carbonic matter proceeding from the muscles; other products, such as the carburetted hydrogens, liquid or gaseous; the carbonate, acetate, hydrosulphate of ammonium, &c., were not so immediately applicable to ordinary purposes. M. Séguin had more particularly turned his attention to the utilising and the previous purification of the volatile and gaseous product. He had succeeded in the first place in drying the muscles of animals, by a peculiar process, so as to admit of their being kept in storehouses with very little annoyance from the effluvia: he had then employed a slight steam condensation, jointly with a washing and purifying of the muscles, by a saturated dissolution of chloride of calcium, and he had thereby been able to preserve to the gas which he extracted all its illuminating powers, while he had completely separated it from the ammoniacal salts that might render it fetid, by converting them direct into hydrochlorure of ammonium. Such gas thus purified was found to contain about ten grammes of empyreumatic vapours per cubic metre; and its illuminating power was such, that during one hour twenty-two litres of this gas would give as much light as a good Carcel lamp. The empyreumatic vapours just mentioned were not found to be condensed by a low temperature; but they were capable of becoming liquefied by compression, and thus produced a liquid having the appearance of ether for fluidity, and burning with a fuliginous flame but without any odour. The apparatus used by M. Séguin effected an immense saving, both of space and fuel: and the

results of his experiments might be tabularised as follows:—

One horse, of average weight of 220 kilogrammes, gave	
Gas.....	22682 litres, or light for 411 hours;
Sal ammoniac	18.5 kilogrammes;
Ivory black..	21 kilogrammes.
Value of gas at 5 centimes per hour .....	26fr. 55c.
Ditto of sal ammoniac .....	36 50
Ditto of ivory black .....	3 15
Total value .....	80fr. 20c.

Now the average price of such an animal for killing, or dead, was 17fr.; the labour, &c. of extracting these matters cost 4fr. 25c.; cost of various accessory materials, 2fr. 70c.; fuel, 1fr. 60c.; total, 25fr. 55c. The ordinary knackers of Paris never get out of the parts from which the gas is thus produced more than about 5fr. worth of grease; and, since Paris furnishes annually from 15,000 to 16,000 dead horses, the value of this method may be easily estimated. If to this be added the gas that may be obtained from the bodies of other animals, and from animal refuse matter in the capital, the total quantity to be obtained from these hitherto neglected materials will be found to be immense.

M. Pérouze read a report on a memoir by M. Boutin, on the production of a new acid from the root of the aloe by the action of nitric acid, which had a beautiful red colour, and was found to be of great utility to dyers. The same member announced on the part of M. Langlois, Professor of Chemistry at Strasbourg, that he had succeeded in isolating hyposulphuric acid by the action of perchloric acid and hyposulphate of potassium. The acid concentrated *in vacuo* was a colourless liquid slightly inclining to a syrup, attracting moisture and decomposed at 80°.

Notice was given from M. de Humboldt of Galle's third comet.

*Académie des Sciences, Morales, et Politiques.*—Sitting of March 14. A learned memoir was read from Dr. Edwards, on the natural history of man, considered with regard to the diversity of races and the peculiarities that distinguish them.—M. Arbanère, correspondent of the Academy, communicated some observations on the manners of the ancient Romans.—M. Blanqui gave an account of a work by M. Horace Say "On the Commercial Relations of France with Brazil," in which numerous questions of importance to the economical conditions of the two countries were discussed. It was an interesting period, M. Blanqui observed, to notice in the relative positions of the countries treated of, when a colony was raising itself to the rank of a mother country, and the original country, Portugal, was sinking, with regard to France, to the rank of a colony.

*Académie de Médecine.*—At the last sitting M. Orfila submitted to the Academy a long memoir, full of minute details, of his experiments on poisoning by tartar emetic. After death had occurred by the administration of this poison, he had succeeded in detecting traces of the deleterious substance in the various organs, the blood, &c. of the body. To perform the experiments he had introduced from 36 to 110 grains of the emetic into the cellular tissue of a dog; and, at another time, from 15 to 25 grains into the stomach of an animal of the same kind, after having had the oesophagus tied up to prevent the action of vomiting: in these cases, the animal always died between two and four hours after taking the emetic, according to the dose and the age or strength of the dog. In one case, the animal had died although only a few grains of this substance had been rubbed on its thigh un-

covered of its hair. At the expiration of a few hours the blood retained no trace of the poison, and at a later period no vestige of it could be found in the body.

The *Société d'Encouragement* has just made its annual distribution of prizes: among them we observe one of 14,000 francs to Messrs. Guinand, junior, and Bontemps, of the glass works at Choisy le Roi, for their improved manufacture of flint and crown glass for astronomical purposes. The subjects of prizes for the ensuing year were given out on the same occasion: they comprise one for improvements in photography, especially as to the taking off at least 200 copies from the same Daguerriotypic image; the forming of images by means of lamplight, &c., and the representing the colours of the various objects represented. Prizes are also announced for the introduction of new species of leeches into France, for the stocking of pools and rivers with them, and for means of utilising leeches after they have once sucked. Prizes will be given by this Society for new methods of making potato-flour and bread, and for the extension of the use of iodine and bromium.

A new and entertaining work, by M. A. Jal, entitled "Soirées du Gaillard d'Arrière," has just appeared. It is a lively portraiture of naval manners of various epochs anterior to the nineteenth century, each story being accompanied by amusing and instructive notes. This gentleman is well known as one of the best writers on naval matters in France: and his "Archéologie Navale" is a work of high historical interest. He holds an important office in the department of the minister of marine, and is a very gentlemanlike and amiable man.—M. Jouannin, head interpreter-royal for Oriental languages, and the learned M. Van Gaver, have just published a "Nouvelle Histoire de la Turquie." It is comprised in only one volume, but gives an account in this short compass of all the principal points of Turkish history down to the present day, together with an *aperçu* of their manners and customs. M. Jouannin has resided a long time in the East, and has executed this work, together with his collaborator, conscientiously. It is, besides, illustrated with 100 engravings.—An indited grammar of the "Romane" language of the thirteenth century, entitled "Donatus Provincialis," and signed Hugues Faidit, has been published by M. Guessard; and another of the same epoch, entitled "Draita Maniera de Troba," signed by Raymond Vidal, has been given to the public by the same gentleman. Several MSS. of these works had long been known to antiquaries; and M. Raynouard, in his "Selected Poésies of the Troubadours," had noticed them: they are similar to each other, being both imitations of the Latin grammar: the latter, by Raymond Vidal, is the more scientific production of the two.—M. Guichard has published a luminous notice of the great Latin poem of the fourteenth century, the "Speculum Humanae Salvationis."—A very interesting notice of Robert Stephens, the great printer, and of his intercourse with Francis I., has been compiled and published by M. Crapelet, the most intelligent, if not the most extensive, printer of the French metropolis. This book is a good companion to Renouard's excellent work, "Les Annales des Aldes." The typographical details, and the account of Stephens's establishment in the Rue St. Jean de Beaurvais, are well worthy of perusal.

The sale of the library of the great Orientalist, the late M. Kilaproth, has been going on for some days. Some of the books have sold

well; but in general they have gone at low prices. Considerable quantities have been purchased for England and Germany.

Vandael, the eminent flower-painter, died on the 20th instant, in Paris, aged seventy-six. Another artist of distinction, Professor Domenico Pellegrini, of the Academy of St. Luke at Rome, died there on the 4th, aged eighty. He has left all his collections, &c. to the Academy. M. Dumuchel, of the order of Jesuits, formerly professor of mathematics at Belley, in France, and a learned astronomer, died recently at Rome.

At a recent meeting of the Royal Agricultural Society of Turin, M. Bertalazone and M. Blengini communicated a memoir on the composition of a liquid for preserving grain from the attacks of insects. The Secretary read a paper from Professor Florio, on the cultivating of some wild upland districts (Monticelli di Curino nel Biellese), and other similar districts. The Director, Count Valperga di Civrone, distributed to the members some tuberous roots of the *Oxalis cremata*.

The answer to the Sciarada in our last is "Roda-no."

On the 29th February, at 2½ A.M., two slight shocks of earthquake, at an interval of one minute, were felt at Parma.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

In a convocation holden on Thursday last, the Degree of Doctor in Civil Law, by diploma (the highest honour the University can bestow), was conferred upon his Royal Highness Prince Albert.—*Oxford Herald*.

CAMBRIDGE, 18th March. The following degrees were conferred:—

*Masters of Arts*.—Rev. G. Williams, King's College; Rev. T. D. H. Wilson, Trinity College.

*Bachelor of Arts*.—J. Hutchinson, St. John's College.

#### ROYAL SOCIETY.

THE Marquess of Northampton in the chair.—Mr. Faraday's communication, entitled 'Experimental Researches in Electricity, Seventeenth Series,' was resumed. The following is our summary of this and the sixteenth series:—

These papers are devoted to a close experimental examination of the two opposed theories of voltaic excitement; namely, those of contact and chemical action. When the author had discovered and established, in 1833, the definite chemical action of electricity, he applied that principle to the investigation of the disputed question; and then took part with those who held the theory of chemical action against that of contact. His paper drew forth an elaborate reply from the eminent Italian philosopher Marianini, and the opinions of such a man reacting on Mr. Faraday's mind, induced him to enter far more deeply into the question than before; not for the purpose of sustaining a controversy, but for that of obtaining a thorough demonstration and conviction of the true theory, whichever it might be. Having arrived at the conclusion that the chemical theory expresses the truth, he first does justice to those who have supported that theory, and, above all, to De la Rive, whose arguments alone he thinks ought to have been sufficient to convince, though they have failed to do so; and then states the various views of contact and of chemical action which are given by different philosophers. The contact theory of Volta as extended by others to the effects of bad conductors, and the chemical theory of De la Rive, are the two which he places in contrast and examines. In the theory of contact, it is said that when two conducting bodies are brought together there is a force, at the points of

contact, by which electricity leaves one of the bodies and goes to the other without any change in the nature of the acting particles: that when a circuit or ring of metallic, or solid conducting bodies, is formed, the force at the different points of contact are exactly balanced, and so no current is produced; but that whenever a liquid or humid conductor forms part of the circuit, then this balance does not occur, and a current is the result. The author, therefore, sought for liquid or humid conductors which, in the first place, should be able to conduct very feeble electric currents, as those of a thermo-arrangement; and, in the next, should have no chemical action upon certain different metals plunged into them. Of these he found several, as solution of sulphuret of potassium, hydrated nitrous acid, solution of potash, &c., and constructed currents of them and different metals. In this way he obtained many arrangements with two metals, and a fluid conductor, which were perfectly well able to conduct a very weak thermo-current, and yet had no power, by themselves, of exciting any electric current; thus disproving that great distinction which the contact philosopher takes between good solid and imperfect fluid conductors in their theory, and which is essential to it in its application to the voltaic pile. As already stated, the sulphuret of potassium is one of the fluid electrolytes, which can thus form part of an inactive circle when arranged with metals, as iron and platina, on which it does not act chemically; but when associated with metals on which it can act, it then forms most efficient voltaic arrangements, thus proving the truth of the chemical theory. The author examines into the results produced by it at such times. He shows that when, by the action of the soluble sulphuret on the metal, as with lead and bismuth, an insoluble investing film is formed, which prevents further chemical action, then the current stops as the action stops, notwithstanding that the whole circuit can still conduct a feeble thermo current. He shows that when the investing coat is porous, and admits of the continued chemical action of the fluid, the current continues also. He shews the conditions and effects when conducting and non-conducting, or soluble and insoluble bodies, are produced by the mutual action of the solution of sulphuret and metal: all the phenomena are reducible to these simple principles, that whilst the chemical action can go on an electric current is produced, and when that action ceases the current ceases also. These are the general contents of the sixteenth series. In the seventeenth series the author considers the influence of those circumstances which, being known to affect the exertion of chemical affinity, are applicable in their nature to the voltaic pile. Two of these are *heat* and *dilution*. After searching for thermo effects and explaining all the precautions necessary, it is still found that heat, when applied to one of the contacts of a circuit containing only one metal and one fluid, can make it active in consequence of its influence over the chemical forces at the place of its application; and thus further evidence in favour of the chemical theory is obtained. Dilution produces still more striking results. If the two ends of a piece of metal be plunged into the same acid, either end can be made either positive or negative to the other, and a powerful current be produced merely by a difference of dilution at the two points of contact; provided the metal be one that can be acted on chemically by the acid, but not at all if it be a chemically inactive metal. Groups of four and five metals are given, in which any one metal

can be made either positive or negative to any other in the same acid solely by a difference of dilution. The contact philosopher says that metals have a certain order by virtue of their contact force; silver being negative to copper, copper to antimony, antimony to iron, iron to lead, lead to zinc, &c. &c. In the paper, experiments are described in which seven different solutions were taken and ten metals, and the order of the metals was found to be different for every solution, those which were first in one solution being almost last in another. Thus the force of contact amongst the metals cannot be much, since it is thus thoroughly overruled by chemical forces:—the author considers it as equal to nothing. A contrast is then drawn, by the comparison of numerous cases, between the sufficiency of chemical actions to produce voltaic currents without metallic contact, and the incapability of contact, either of metals or fluids, to produce any current without chemical action. Not a single case of the latter kind is known. That chemical action is quite sufficient to account for the origin of electricity in the voltaic pile, is then shewn by the close association and accompaniment of the latter upon the former, its occurrence and stoppage with it, and especially the dependance of its direction upon the place where the chemical action occurs; for as the latter can be changed about from side to side, the former is in such cases always found to change with it. The discovery, by Seebeck, of thermo-electricity, and the occurrence of its most powerful arrangements amongst the metals, is considered by many as shewing that metals have electro-motive forces at their points of contact. The author, therefore, examines these cases, and shews that they are quite unlike cases of voltaic excitement, present a different order of effects, having nothing in common with them as to the origin of the electricity, and being utterly inconsistent with them when viewed by the contact theory. The author concludes his examination of the two theories by some remarks upon the unphilosophical nature of the force assumed by the contact-philosophers. That a force should exist at the place of contact able to disturb the arrangement of the electricity, notwithstanding obstructing forces unable to retain that disturbed state, and yet again, when the disturbed state has spontaneously fallen, able to renew it, is to make cause first greater than effect, and then less, and then greater again, in a manner quite irreconcilable with natural laws. The author thinks that if the contact theory were true, it would be easy to obtain, not in principle only, but in practice also, a perpetual motion; for as the electric current is, on that theory, produced without any consumption of other force or any alteration of the acting parts, and as it is easily convertible through magnetism into mechanical force, no possible reason can be given why a perpetual motion should not be at once produced; a sufficient proof that the theory on which such a conclusion is founded cannot be correct.

#### ROYAL SOCIETY OF LITERATURE.

ON Thursday, the President, the Earl of Ripon, in the chair.—His lordship communicated to the meeting the presentation of congratulatory addresses to her majesty and Prince Albert, and the answer of the latter, in which his royal highness, in very gratifying terms, consented to become an Honorary Member of the Royal Society of Literature, of which his diploma will, of course, be forthwith transmitted to him.

The Marquess of Northampton, P.R.S. was proposed as a member; and, being a peer

of parliament, was immediately balloted for, without the form of suspension, and elected.

The Chevalier Brönsted then proceeded to give a description of a noble bronze vase in the Roman College at Rome, which seemed hitherto to have obtained less public notice than it was entitled to receive, though Winkelman and Visconti had both examined and spoken of it. The circumference of this splendid production of ancient art was above four feet, and embellished with a highly spirited design of an episode in the history of the Argonautic expedition. The lid was also beautifully ornamented with figures exercising in the chase. The vase was found near Palestrina, the ancient Præneste, about the middle of last century; and M. Brönsted adduced strong reasons for thinking that its subject was copied from a picture painted by Cydias for the celebrated orator Hortensius, and to adorn his villa at Tusculum. This picture is mentioned by Pliny, who states that Hortensius gave 164 talents for it; and, not having a room large enough for it, built a pavilion on purpose for its reception. It represents Pollux, having conquered him with the cestus, in the act of tying to a tree Amycus, king of Bebryces, and the gigantic guardian of a spring of fresh water, who had been in the habit of slaying voyagers who came to seek its refreshing draughts without his permission. A Victory is descending with a wreath, and at the foot of the tree lies an attendant with a strigil and other articles for performing the bath of the hero. By the by, we may mention that the vase itself was for holding such articles,—the towel, glass, &c. &c. which the toils or sports of ancient warriors rendered so necessary. Castor, in a Phrygian cap, is another fine figure; and various individuals with vessels to carry away the water, now its keeper has been vanquished, occupy more than half the area. The water is gushing from a grotesque fountain, and by its side rests a fat satire-looking fellow, the jester of the expedition, in a comic mask. He is punching his stomach in ridiculous imitation of another character, who having hung up a skin of wine is gauging the quantity of its contents by the usual mode of striking it a blow with his hand. The ship *Argo*, and sailors, &c., in easy and graceful positions, finish the actors in this lively scene; and the armed Pallas of Athens is the deity introduced to afford it the sacred sanction almost invariably found in ancient classic compositions. The whole is in gold on a green ground; and nothing can surpass the drawing and natural action of the group.\*

M. Brönsted also exhibited a very handsome vase, purchased from Campanari's collection, where it was described as the "Return of Ulysses;" but the Chevalier shewed that it represented the initiation of a youth previous to the games, and his presentation as a victor from the arena. The explanations, as in preceding cases, were full of learning; and brought a mass of interesting collateral information to bear upon and illustrate the principal inquiries.

#### SOCIETY OF ANTIQUARIES.

MR. HALLAM in the chair.—Mr. Britton exhibited drawings of Barfreston Church, Kent, accompanied by a printed description.—Mr. De Schriya exhibited a mask, formed of green mosaic work, supposed to be Egyptian.—A letter was read from Mr. Rosser, stating that, through means of the arms on the engraved stone at

Brading, of which he exhibited a rubbing at the previous meeting, he had discovered the family of the person to whose memory the stone was placed. The name, as spelt on the stone, was "Johannes Cherowin," and the arms belonged to the family of Curwen, settled at a very early period in Cumberland.—Mr. Halliwell communicated some observations on a MS. work called "Speculum Christiani," preserved at Corpus Christi College, Oxford.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday.*—Civil Engineers, 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.  
*Thursday.*—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.  
*Friday.*—Royal Institution, 8½ P.M.; Botanical, 8 P.M.  
*Saturday.*—Asiatic, 2 P.M.; Westminster Medical, 8 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS, IN SUFFOLK STREET.

[Second Notice.]

470. *Scene from Sir Walter Scott's Novel of "The Pirate."* J. Irvine.—We have seldom met with a more perfect pictorial illustration of the scenes and characters described by the highly gifted Northern than this. Norna of the Fitful-Head is represented standing over the body of the half-drowned pirate, like a potent enchantress presiding at some infernal incantation; to which the caverned rock and the tempest-tost ocean are appropriate accessories.

492. *Madge Wildfire and Jeanie Deans.* W. P. Frith.—We are often led in our pictorial range from the sublime to the ridiculous, as it will be seen we are in the present performance, compared with that which we have just mentioned. The contrast is finely borne out by the fantastic figure of the demented Madge; the humility and shame of her companion; and the indignant regards of the disturbed and insulted congregation.

497. —. H. O'Neil.—An ample quotation in the catalogue explains the subject to be the surprise and incredulity with which an Italian prince in exile listens to the predictions of a barefooted sibyl, who promises him a speedy restoration to the dominions from which he has been driven. The group is tastefully arranged, and the whole is carefully and beautifully executed.

466. *Estella introducing Gil Blas to the Marquis de Manalva as her Brother.* T. M. Joy.—An imposition, artfully carried on, both by the writer and by the painter:—laudable in the latter, as affording a proof of his talents; blamable in the former, as giving interest to a stratagem of licentious deception.

410. *Evening—Landscape and Figures.* A. Clint.—Pastoral in character; glowing in effect.

471. *Landscape with Cattle: Morning.* J. Tennant.—A beautifully clear and brilliant picture.

473. *A Milking-Shed.* T. S. Cooper.—One of the most pleasing and attractive works of the kind in the gallery.

487. *Rue de l'Hostellerie.* C. F. Tomkins.—Subjects of this description have become striking features in all our exhibitions. They have been ably supplied to the present, in many interesting varieties, by Mr. Tomkins.

Our walk is now into the Water-colour Room, where, however, as on former occasions, the paintings in oil are continued, and with a brief notice of which we shall conclude next Saturday.

#### THE FRENCH SCHOOL OF ART.

##### *The Louvre: Salon of 1840.*

AT the beginning of March, according to the custom that has now prevailed in Paris for several years, and is likely to become a permanent one, the annual exhibition of the works of modern artists was opened in the Long Gallery of that magnificent palace the Louvre. Public expectation, always more or less alive to an event of this kind, in a capital where art is certainly making progress, and where the poetry of art is daily more and more felt, was not so strong this year as it had been on many former occasions: the Exhibition had got a bad character before it came into existence: the jury of admission, it was known, had been doing some dirty work on an unusual scale of atrocity; and Minerva had not been over-propitious, it was said, to the artists themselves: many of the brightest names of the French artistical world would be wanting in the catalogue: and, on the whole, it was expected to be *un trieste salon*. The truth turns out to be, that if it is not a *first-rate salon*, it is at least a good second-rate. The great men of the day, it is true, have hardly any thing there, and it does not contain the same number of articles; but, on the other hand, there are many very nice things in it. The younger artists have acquitted themselves very creditably: and four or five hours may be lounged away with great pleasure.

To those of our readers who, in this "positive age," as the French term it, are fond of statistical returns, we will at once disburden ourselves of some crabbed numbers that have been staring at us in our note-book for the last three weeks, and by which we can give them the precise ratio and proportion of the thing. The numbers of articles in the printed catalogue go up to 1849, subdivided as follows:—Paintings, water-colour drawings, and miniatures, 1666; sculptures, medals, &c. 85; engravings, 59; architectural drawings, 16; lithographs, 23. These have been furnished by 1001 artists of all kinds; of whom 131 are of the softer sex; and of these, again, 84 are unmarried. Out of the 1001 there are 896 living in Paris; 69 in other parts of France; and 36 in England, Belgium, Holland, Prussia, Bavaria, Italy, Spain, and Switzerland. Again, out of the 1849 articles, 710 may be termed portraits, including 651 oil-paintings, water-colour drawings, and miniatures—portraits properly so called; 42 statues, busts, statuettes, and medallions; and 17 engravings and lithographs. So much for the statistical part of the matter. The only statistics that are not unfriendly to the arts, are the pounds, shillings, and pence of a generous patron!

At the risk of wearying our readers' attention, we shall be bold enough to deliver our opinion upon various points connected with the fine arts among our Gallic neighbours, before we come to the immediate matter of the present Exhibition. We shall thereby run a better chance of making our remarks more palatable; and shall bring out the lights and shadows of our own impressions more agreeably to ourselves, and more profitably—if, indeed, they be profitable—to others.

There is no doubt that art is warmly felt in France, and that the importance of cultivating a love for it in all its branches, as a powerful means of civilisation—to say nothing of its being a main ingredient of national happiness—is perceived by all the enlightened classes of the community. The public institutions connected with art, and the annual grants made for their maintenance, are abundant proofs of this. An attentive observer of the present social

\* Owing to the later appendage of some gross figures, fastened to the lid of this pure production of art, connoisseurs had been misled into the belief that it was executed by a Roman artist. Such forgeries and impositions are but too common in Italy.

condition of the French nation will give additional confirmation to the statement, from the manner in which he cannot but know it to be now interweaving itself with the inmost relations of domestic life. But the peculiar branches of art which come to be patronised, more than any others, are not the same in France as those in England; nor are the means and modes of increasing patronage at all less dissimilar. Three-fourths of the public think that the delineations of human actions, the representation of scenes of military, political, or social interest, are alone worthy of the honours of the canvass; and they consider the fair face of nature, the whole series of landscape and animal delineations, as nothing more than trashy daubs. The French nation are full half a century behind the English in their knowledge of, and their love for, the sweets of simple natural objects, and their embodied representations. Thus in all their public exhibitions the landscape department, though it holds its full share of honour in the artistical world, is never so much sought after as the historical: and the badness or goodness of a collection is invariably decided in Paris by the merits of this latter division. Architecture, again, though fully appreciated in *re*, is not thought much of on paper; and in the Louvre some half-dozen amateurs may be seen looking at drawings of this kind, while before a picture with a little touch of the *grande armée* in it, or before a first-rate suicide, or a man going to be guillotined, &c. there is such a crush, that the canvass runs a good chance of not being examined by any except a most intrepid elbow-thruster. The small proportion of architectural subjects in this year's Exhibition, only sixteen, is a striking instance of this apathy; more especially when it is known that the increase of private buildings in Paris during the year has been very considerable, and that architectural taste and knowledge are no where more soundly based or more widely spread than among the French people. This anomaly, for which we are totally unable to account, is rendered still more inexplicable by the fact that French architects are remarkable for their great powers as draughtsmen, while their portfolios are known to be full of works of the greatest beauty and merit. In their manner of patronising art, the French leave much to their government, and encourage it only indirectly themselves. The numbers of persons who purchase the works of modern artists from the hands of a dealer, compared to those who make their acquisitions in the studio itself, are large; and the main patron, the principal dealer, though not the most liberal, is the state itself. On a previous occasion, we took the opportunity of remarking that this direct and constant encouragement of the state was necessary for the maintenance of a good school of historical painters; while on landscape painters it produced much less effect, whether for good or evil. All that we have now to observe is that the French public—the individual amateurs—do not purchase landscapes enough, nor do they pay sufficiently good prices for such productions, to admit of that branch of art making all the progress of which it is capable; and, further, that the Institution of an Academy of Fine Arts, though it is no doubt an honour to the nation, and an immense encouragement to rising artists, is in various respects productive of a good deal of discouragement and mischief.

Thus the right of admitting works of art into the annual Exhibition of the Louvre, lies with all the members of the Academy, in their several classes of painters, sculptors, architects,

and engravers, who vote by ballot on each single picture as it is brought before them. We may at once state for those of our artistical friends who may ever feel disposed to contribute works to this Exhibition, that a written notice has to be given to the Director of the Louvre, on or before the 1st of January in each year, of all the works that the artist is about to send. The articles themselves must all be sent in on or before the 15th of February, and the jury decide on their admission into the gallery between that day and the 1st of the ensuing month. No notice is given to the artist of what is or what is not admitted, and the only intimation he receives of it is either by not finding his works entered in the catalogue, or else from the servants of the establishment. The members of the jury are split into various rival schools and jealous cliques, actuated by the petty passions that too often distract the world of art, and open to all means of secret influence; while, in their joint corporate nature, there is no artistical atrocity that they are not capable of committing. If the architects find that the painters have acted unfairly to the works of any incipient Vitruvius, away go their black-balls into the fatal urn, and a regular Homeric slaughter ensues among the vulgar crowd of the brush and palette. The sculptors are particularly touchy, and a slight put upon two or three of their *protégés*, is avenged upon the herds of masons and daubers without any compunction. The most deadly feuds, however, are those existing in the painting division. Here a partisan of the old heroic school of David, Girodet, Gérard, and Co., hates an *Ingrist* (one of the pupils of the eminent director of the French Academy at Rome, M. Ingres) as thoroughly as a cat detests water; and an *Ingrist* again abominates, loathes, and anathematises every thing that has the least dash of colour in it, and militates against the sombre but correct style of his own favourite master. From each of these rival cliques there is little chance of fair dealing towards a member of an hostile school; and it is a well-known fact that the most unjust exclusions are continually voted, while the most improper admissions are frequently made, from little else than motives of personal hostility. This year the jury have rejected about 2000 works of all kinds, and among them many productions of first-rate merit; the discontent caused by which has become so strong, that the sufferers have determined on petitioning the Chambers for a remedy of the evil; public spirit not being sufficiently strong in Paris to prompt them to the only effectual cure of such things, the establishment of an independent exhibition. It may not be uninteresting to give a complete list of the members of the *Académie des Beaux Arts*, because their names are continually appealed to in cases of this kind, and it is fit that the irresponsible censors of the fine arts of France should be known to the public. The painters are Messrs. Garnier, Hersent, Bidault, Ingres, Horace Vernet, Heim, Granet, Blondel, Vinchon, Paul Delaroche, Drolling, Abel de Pujol, Picot, Schnetz, and Conder; the sculptors are Messrs. Bosio, Ramey, Cortot, David, Pradier, and Nanteuil; the architects are Messrs. Fontaine, Huyot, Vaudoyer, Debret, Lebas, Leclerc, and Guénepin; the engravers, Messrs. Tardieu, Boucher-Desnoyers, Galle, and Richomme. Out of this number, M. Ingres is at Rome, and never votes; and Messrs. Vernet and Delaroche have long abstained from voting, being anxious to avoid sharing the odium with which the ostracising acts of their colleagues are always visited by the

public. As instances of the unjust system that has been exercised this year, we may mention that *all* the works of one of the most eminent of the young painters of France, M. Gigoux, whose admirable illustrations of "Gil Blas" are so well known to the public on both sides of the Channel, have been excluded; and that a very remarkable picture by M. Eugène Delacroix, one of the most original painters in France, was admitted by a majority of only one white ball.

(To be continued.)

#### MR. J. LUCAS'S PORTRAIT OF THE DUKE OF WELLINGTON.

It is said that the Duke of Wellington has declared—and his declarations are seldom lightly made—that this is the last portrait for which he will ever sit. Really, we are not surprised that his grace's patience is exhausted by the repeated demands of a similar description which have been inflicted upon it, and which, we presume, nothing could have induced him to bear so long, but the consciousness that they were so many proofs of the unbounded gratitude, admiration, and respect of his country. Having, however, determined on concluding his pictorial career, it is with infinite satisfaction that we beg leave to congratulate the illustrious veteran on his closing it, *parvum componere magna*, with as much success and brilliancy as his military. Mr. Lucas has outdone himself in the fine work under our notice, which, during the present week, has been privately exhibited at the house of Mr. Moon, who will publish an engraving from it by Mr. Cousins. It is a whole-length—*debout* (as our friends on the other side of the Channel say). The head is, in every respect, admirably painted; conveying, without either extenuation or aggravation, a faithful idea of the Duke's features and expression, at the present period of his life. His Grace is dressed in black, and wears the robes of the Chancellor of the University of Oxford; sufficiently, however, thrown back to shew the riband and order of the Garter. Next to the head, we were especially struck with the masterly manner in which Mr. Lucas has managed the masses of gold lace on the robes, retaining their richness and splendour, and yet preventing them from being staring and obtrusive. With the hands we were not quite so well satisfied. The background, and the various accessories of the picture, are treated with great skill. This invaluable performance the Duke intends to present to the University of Oxford; and it will, no doubt, be placed in the Bodleian Library.

#### NEW PUBLICATIONS.

*William Evans, Esq. Sheriff of London and Middlesex, 1839-40.* On Stone, by Weld Taylor, from a Drawing by J. Linnell. Boys. JUDGING from the strong and decided marking of the features, and from our experience of the fidelity of Mr. Linnell's pencil, we have no doubt that this is a striking resemblance of Mr. Sheriff Evans, whose recent incarceration, with that of his colleague, has been the subject of so much stormy discussion, both within and without the walls of parliament.

*Recollections of the Scenic Effects of Covent Garden Theatre during the Season 1838-9.* By G. S. Nos. XIII. and XIV. Pattie. WITH these numbers, dedicated to "Virgil" and "The Two Foscari," both affording striking instances of Macready's dramatic genius, our young artist has concluded his labour of love. The whole series will greatly aid to

preserve the memory of the noble stand made for the English stage at this period; and when the generation who witnessed it has passed away, will shew the next something of the character of the efforts by which the national drama was redeemed, and a new impulse given to its literature and performances. To what final result remains to be proved; but all must acknowledge that a very beneficial effect has been produced by the manner in which Covent Garden was tenanted in 1838-9.

### THE DRAMA.

*Her Majesty's Theatre.*—A new ballet, and one likely to be very popular, has been produced under the direction of M. Barrez, its Parisian parent. The gist lies, or rather leaps, in the representation of the various effects of the bite of the tarantula (whence the name, *Tarantule*) upon the heroine, Fanny Elsler; whose remarkable performance, by turns wild, characteristic, graceful, and expressive, drew down thunders of deserved applause. It is, indeed, a very novel and extraordinary exhibition of the language of limb and motion.

*Covent Garden.*—On Monday, *Romeo and Juliet* was repeated, with Miss Emmeline Montague, from Drury Lane, as the representative of *Juliet Capulet*. In our preceding notice we omitted to give the praise due for the production of the tragedy with the text of Shakspeare, and got up in dresses and scenery with all the beauty, spirit, and propriety which belong to this theatre. But, in fact, we are not sure that we can always depend upon the announcements in the playbills; for example, those issued on Monday would puzzle a conjuror unacquainted with dramatic history, by advertising, "On Wednesday, fourth time, *Colley Cibber's Comedy of the Double Gallant*," and the very next paragraph, "On Thursday, fifth time, *Mrs. Centlivre's Comedy of the Double Gallant*," as if there were double comedies and double authors, as well as a double title to this double-dealing composition.

Tuesday was a bright day in theatrical annals, with *The Wonder* of two queens in the house, her Majesty and Queen Adelaide, and Charles Kemble, revisiting the domain of Comedy, by royal command, in the part of *Don Felix*. Covent Garden was thronged in every part; and it seemed as if some magic wand had revived the palmiest period of the drama, by the mere reintroduction of an individual who had (judging by his success on this occasion) far too soon relinquished the profession of which he was so distinguished an ornament. Without having seen the effect produced, it is impossible to convey an idea of the performance. It was not only the delineation of a masterly artist, but the infusion of his skill and spirit into every one who acted with him. Mrs. Nisbett's *Donna Violante* was infinitely the best thing she ever did upon the stage; charming from beginning to end, and full of variety. She looked most captivating; and the whole play of the part (the grave and the gay, the sentimental and the capricious) was equally marked by grace and talent. She must now be aware that she possesses powers for the stage beyond the sphere of personal attractions, and which, if well directed, will place her in the foremost rank of that very difficult walk which requires the ladylike and *spirituelle* embodiment of genteel comedy. A similar remark applies to the other characters. Mrs. Orger and Mrs. Humby were excellent in *Flora and Isis*; Harley more than usually laughable in *Lisardo*; and M'Lean, a capital *Gibby*.

Cooper, Bartley, Meadows, and Mrs. Brougham, filled up the cast in a manner to leave us nothing to wish for. Of Mr. Kemble's own personation of the hero, it is impossible to speak in terms too eulogistical. It was finished with consummate art, and had all the elasticity and buoyancy of youth combined with the utmost carefulness of study and maturity of judgment. It was a living lesson for every aspirant to dramatic fame, and afforded another proof of what we have always maintained—that if you produce what is really admirable, the public favour will not fail to support the national and legitimate drama. It is mediocrity and pretence that have depressed it. We have seen what the buskin can do; and here is unanswerable evidence of the efficiency of the sock. In short, it was a gratifying scene in every way; and we cannot do better in describing it than to repeat the words of a judicious critic, "I have witnessed a comedy again."

On Thursday, *Mercutio* was performed in the tragedy of *Romeo and Juliet* by Mr. Kemble. It is well remembered as one of his finest personations, and it has not moulted a single feather. The Queen and Prince Albert were again present, the play and character being by her majesty's desire.

*Haymarket.*—The same evening an extravaganza (from the French) in three acts, called *The Three Grocers*—a grocer for every act—was produced here; and cleverly acted by Webster (its author), Strickland, and O. Smith, as *Hobbs, Dobbs, and Stubbs*, the trio of Epicureans; and Mrs. Clifford, F. Matthews, and Miss Charles, as their wives. The plot is a *congeries* of jealousies, arising out of the loves of younger shopmen, *Valentine* and *Jeremiah*, Mr. J. Webster and Oxberry, and *Ross*, Miss Travers. There is a good deal of fun in the piece, but it requires curtailment to make it popular. The Duchess of Cambridge and Prince George were at the theatre: these royal visits must be very beneficial to the interests of the drama.

*Adelphi.*—The *Pilot* has been revived with as much success as when first produced.

*Olympic.*—*The Happiest Man Alive*, by Mr. Bernard (who ought himself to be happy, if continual success attending every new piece he produces can place a dramatic author in that enviable state), was brought out here on Saturday, and has had a merry run ever since. It is a very lively and entertaining burletta, wherein the man of all others the happiest in mistress, friend, and man of business, is suddenly struck "all of a heap" by the rascality of the last, and the supposed treachery of the former two. It turns out, however, that the lawyer alone is faithless to his trust, and that "My Poll so fair and friend so rare" are true; and so all ends as it ought to do, in the punishment of the attorney, and the reunion of the worthy characters. Mr. J. Vining and Mr. Halford were quite at home in their parts; Mr. Turnour, with his quaint humour, very laughable in *Drax*, the rogue-partner of the rogue-agent; and *Ross*, an amusing jackanapes of a servant.

### VARIETIES.

*Prince Albert.*—The industrious and deserving artist, Mr. Minasi, in his sixty-fourth year, has made a pen-and-ink copy of *Ross's* portrait of Prince Albert, and executed it in a style of great beauty. The delicacy of the finish is really wonderful, and the likeness is faithfully preserved. We trust it may lead to the benefit of an individual who, we fear, has the claim of misfortune to add to that of curious talent and peculiar merit.

*Science and War.*—As it is not improbable that a British expedition may invade China, we would recall to the memory of our government the excellent example set by the late Imperial ruler of France on similar occasions. The expedition to Egypt was accompanied by Denon, and a whole band of persons eminent in almost every branch of literature and science; and the result of their enterprise has been the appearance of many volumes of the deepest interest and value to those who are more the friends of peace than of war, and rejoice to see any good brought out of evil. And, mentioning the example of France on one point, is it not very gratifying also to see an individual of the high literary character of M. Guizot (an honorary member, let us note in parenthesis, of the Royal Society of Literature) at the head of one of the most important embassies in the world—the representative of France to England? Would that Letters and intellectual attainments were equally honoured by us! But not only is M. Guizot an instance of this kind; we have in his secretary, Mons. E. Herbet, another proof of the respect paid to literary talent by our neighbours across the narrow Channel. The merits of this gentleman may not be so generally known in our society as they deserve to be, and as they are appreciated in his native land, where he was till lately editor of the "*Revue Française*," one of the first literary journals in France, and is (we believe still) head of the department of the Ministry of Public Instruction, which is charged with the great historical works of the kingdom. M. Herbet lately returned from a mission to Constantinople and Asia Minor. Such are the men most fit to represent enlightened nations, amid the stir and clash of conflicting opinions and the elemental struggles into which our era is thrown by new views and great changes in the social and political system; which it requires, indeed, experience, sagacity, and philosophy to regulate and control within the bounds of healthfulness and order.

*New Steam-Vessel.*—Experiments are in the course of being tried with the model of an entirely new form of steam-vessel, and, as far as they have yet gone, with every prospect of a successful result. At present we can only state of this remarkable invention, that there are no paddle-wheels, nor external works of any kind. The whole machinery is in the hold of the vessel, where a horizontal wheel is moved by the power of steam, and acting upon a current of water, admitted by the bow and thrown off at the stern, propels the mass at a rapid rate. By very simple contrivance of stop-cocks, &c. on the apparatus, the steamer can be turned on either course, retarded, stopped, or have her motion reversed. This will be literally a revolution in the art of steam-navigation.

*Earthquake.*—On the 10th of January, the inhabitants of the village of Signes, at the foot of St. Baume, were alarmed by a succession of loud detonations, attended by clouds of vapour and dust, rising from the earth, and ascending vertically in the bright sunshine. They lasted for several hours; and about a fortnight after, when from a deep gulf which had been formed a fountain of troubled and reddish water streamed forth. A small, clear, and limpid lake is the result, which has thus been produced by causes within the view of living men: a key, perhaps, to the phenomena which may have produced others of greater magnitude.

*Dr. Goodall*, the provost of Eton, died on Wednesday. He enjoyed the reputation of being a ripe and excellent scholar.

*American Hypochondriacism.*—There is a man

down east, who is so impressed with the idea that he is a baby, that he takes himself up in his own arms, and suckles, and hushes himself to sleep.

*Talk of fast running, I knew a man who ran so fast round a corner that he caught sight of his own back.—Missouri Gazette.*

*Cockney Con.—When is a fellow nearest heaven?—Give it up? When he's out on a lark.*

### LITERARY NOVELTIES.

*The Elgin Marbles.*—The Chevalier P. O. Brönsted, whose discourses at the Royal Society of Literature we have lately had the pleasure to report, has announced by subscription "A New Explanation of the great Compositions of Phidias in the two Pediments of the Parthenon on the Acropolis of Athens, founded upon the Remains of the Statues now in the British Museum, and those which are still upon the Temple." In his prospectus he observes, that "the collection of Athenian Sculptures now in the British Museum, known by the name of the Elgin Marbles, must ever be considered a most valuable possession to the British Empire, equally honourable and fertile in advantage to the fine arts, and to the science of antiquity. They have, accordingly, formed the subject of many works and memoirs, such as 'The Memorandum on the Earl of Elgin's pursuits in Greece, supposed to be by the late Dr. P. Hunt; the two Memoirs published in 1816 by E. Q. Visconti; the 'Essay on the Restoration of the Two Pediments of the Parthenon,' by Quatremère de Quincy; the opinions of W. M. Leake in his excellent work on the 'Topography of Athens,' and elsewhere; the three 'Commentaires de Phidias Vita et Operibus' (Göttinge, 1827), by C. O. Müller; and lastly, the descriptions of C. R. Cockerell and E. Hawkins in the two last parts of the publication known by the name of the 'Marbles of the British Museum,' and which are illustrated by highly executed engravings from the beautiful drawings from Mr. Corbould. To these may be added the Author's own opinions, as expressed in the preface to the second volume of his 'Voyages et Recherches en Grèce.' These various publications offer a satisfactory proof that the productions of Phidias and his school are looked upon in England, and on the Continent, not only as deserving of the highest estimation as works of art, but as the most classical materials at our disposal for enabling us to penetrate into the taste and spirit of the age of Pericles. Notwithstanding, however, this general acknowledgment, much remains to be done before we can say that the Sculptures of the Parthenon are fully understood, or that they have been sufficiently studied in all their bearings. Their relation to the religion, to the history, and to the poetical mind of that renowned country, and their reference to the habits and ideas prevailing in the Grecian world previous to the fourth century before our era, have never yet received their due weight and consideration. Indeed, it may be said that these sublime works have hitherto been considered in no other light than as specimens of the most renowned of Grecian chisels, and as confirmations of the genius, taste, and wealth of the Athenians in the time and under the guidance of Pericles. They have not yet been contemplated in the graver and not less positive light of a great national homage, equally costly and laborious, to the national deities of Athens, and as embodying in their sculptures the fundamental doctrines of the faith of a people so pious and religious as the Athenians were acknowledged to be, and so tenacious of their creed. From the peculiar characteristics of the four great series of sculptures, which formed the principal exterior decoration of the Parthenon, namely, the ninety-two metopes, the Panathenæic frieze which surrounded the cella, and the two compositions, one on the east, and one on the western pediment, it was natural that the two former should be more readily explained, whilst the latter, from the greater variety of the compositions, and the more mutilated state in which they were found, have been comparatively little understood. All have admitted—at least, none have denied—that groups of very large figures, placed in such a prominent situation, each group consisting of not less than twenty-four statues of colossal dimension, designed under Pericles, and executed by the hand or under the direction of Phidias, forming, as it were, the double diadem of the great temple of the Patron Goddess of Athens, must have had a meaning proportionate, in the eye of an Athenian, to the place which they occupied. But what was that meaning?—It cannot be said that that question has yet been answered; nor was it indeed possible to give a satisfactory solution to the problem, until the various relics of the religious creed, or what may properly be called the *Mythic Mythos* of the Athenian people, scattered as they are in the works and fragments of their writers, should have been considered in all their several bearings: that is to say, in their real historical connexion with the motives, religious or political, by which the authors of works of art of this nature were of necessity influenced and determined. There are certainly some glimpses of the true explanation of these groups to be here and there detected in one or more of the works above cited; but even these lights, when considered as attempts to explain the real and original meaning of every figure, are still very limited; and we must confess that they only tend to increase our astonishment that learned and sober writers still take for granted, for

example, that statues of Hercules or Theseus, of Ceres and Proserpine, of Latona with her children, &c., were amongst the groups of the pediments; whilst to those who will take the pains to look for and to find the truth, it will be most evident that these neither were, nor possibly could be such statues in either of those pediments."

The Chevalier contends for these principles:—"1st. That no one part or figure of a large composition of this nature can be understood without knowing at the same time its reference to the whole. 2d. That no Greek monument of a sacred or hieratic character (and they are all such) can be satisfactorily conceived and explained without a thorough understanding of the religious and other institutions of the state by which it was erected; for in all instances these institutions formed the source of such conceptions, and were, in fact, the base on which the monument itself, with all its concomitant accessories, was raised."

We look with high anticipation to the appearance of M. Brönsted's volume.

### LIST OF NEW BOOKS.

Facts on Mesmerism, by the Rev. C. H. Townshend, post 8vo. 12s.—Causes of the Pressure on the Money-Market in 1839, by J. W. Gilbart, 8vo. 2s. 6d.—W. Rain and melted snow, "19 of an inch.  
Edmonton. CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

"\* We beg leave again to point the attention of our scientific and utilitarian readers to the important matters described in our "Paris Letter." They will see in what useful pursuits our neighbours are engaged. May we add a hope, that the letter on the Annual Exhibition of Fine Arts in Paris will also merit the attention of the artists of England?"

To the Editor of the Literary Gazette.

SIR.—In your No. 1908, page 170, you state, in the returns of the monthly meeting of the Zoological Society, "the mortality of thirty-six monkeys, within the space of three weeks." As I attend regularly to all your observations, I took an early opportunity of going to our Zoological Gardens in this town, where they possess about half a dozen monkeys, to inquire after their health. I find that they are all in perfect health! They are fed on bread and milk, and occasionally a few boiled potatoes; and kept in a temperate atmosphere, never higher than 56° of Fahrenheit. I am told persons often keep them during the winter in summer heat, which weakens the animals, and they speedily go off in declines. There has been but one death all the winter, which was a sick monkey sent from Gloucester in a hopeless case, but too ill to recover! Your Obedient Servant, and Well-wisher to the Monkeys.

Many communications have reached us too late for notice this week.

\* As monkeys are at least as valuable in the scale of society as dandies are, we willingly give place to this letter.—Ed. L. G.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

## A BOTANICAL POCKET DICTIONARY;

comprising the Name, History, and Culture of all Plants known in Britain, with a full Explanation of Technical Terms.  
 By J. PAXTON, F.L.S. &c.  
 Accented and Corrected by  
 PROFESSOR LINDLEY, Ph.D. F.R.S. &c. &c.  
 This work is intended as a companion for the lover of horticulture in all its branches, but particularly for the admirer of flowers. It combines all the most prominent advantages of a botanical catalogue, with the usefulness of a floricultural directory, and the convenience of a pocket dictionary. It will be found especially valuable to the gardener, and gardening amateur, as well as to all who desire an accurate knowledge of botanical nomenclature, or a more extensive acquaintance with the history and peculiarities of plants than is to be gathered from a mere remembrance of their names.  
 London: Published by J. Andrews, 167 New Bond Street.

## THE LIFE AND TIMES OF DICK WHITTINGTON.

By CIT.  
 To be completed in Thirteen Monthly Parts, illustrated by the most Eminent Artists of the day.  
 London: Hugh Cunningham, St. Martin's Place, Trafalgar Square; and Simpkin, Marshall, and Co. Stationers' Hall Court; Bell and Bradfute, Edinburgh; John Cumming, Dublin; D. Campbell, Glasgow.

## ABRIDGMENT OF HIS GRACE'S DESPATCHES.

In 2 vols. price 10s. uniform in Nicolson's Embellishments, &c. with  
**THE LIFE OF NAPOLEON IN THE FAMILY LIBRARY, THE LIFE OF ARTHUR, DUKE OF WELLINGTON.** Compiled from various Authentic Records and Original Documents, and comprising the Substance of the celebrated Despatches.  
 "For the purpose of the general reader this Life is preferable to the others, and it may be particularly recommended to the young, as being free from heavy dissertations, which render other biographies of this description fit only for professional persons."  
 —*Atlas*.

E. Churton, Library, 36 Holles Street.

To be had at all the Libraries, in 2 vols. post 8vo. price 16s.  
**MONTACUTE; or, a New Home—Who'll Follow?**

By MRS. MARY CLAVERS.  
 "The model, both for style and structure, which Mrs. Clavers has followed, is Miss Mitford's; and in 'Our Village.'"  
 "We cannot too cordially recommend these agreeable volumes."  
 —*Sunday Times*.  
 E. Churton, Library, 36 Holles Street.

Complete in 2 vols. 4to. price Five Guineas,  
**A NEW DICTIONARY of the ENGLISH LANGUAGE.**

By CHARLES RICHARDSON.  
 This work consists of two large quarto volumes, upon the composition of which the Author has been employed for more than Twenty Years; and though the expense of publication has exceeded the sum of 6000*l.* it is published at the moderate price of five guineas. The two volumes contain nearly 3300 pages of three columns each, closely, yet clearly and beautifully, printed. In this Dictionary equal care has been bestowed upon the Etymologies and Explanations; and also upon the copious selection of Quotations in illustration of both:—these are arranged in chronological series from Wiclif and Chaucer to Burke and Cowper.  
 William Pickering, Publisher, Chancery Lane, London.

Price 8s.  
**THE PHILOSOPHY OF JOINT-STOCK BANKING.**

By G. M. BEIL.  
 London: Longman and Co. Paternoster Row.

In 12mo. price 4s. 6d. cloth,  
**SERMONS** preached at Oxford.  
 By SAMUEL WILBERFORCE, M.A.  
 Archbishop of Canterbury.  
 James Burns, 17 Portman Street.

In a large and handsome vol. price 12s. cloth,  
**THE PICTORIAL FRENCH DICTIONARY,** illustrated with Seven Hundred and Sixty Humorous Characteristic and Illustrative Engravings on Wood.  
 Charles Tilt, 88 Fleet Street.

Price 1s.  
**BEEs, PIGEONS, RABBITS, and the CANARY BIRD,** familiarly described. Their Habits, Propensities, Dispositions, fully explained; Mode of Treatment in Health and in Disease, plainly and fully stated, and also selection as a Text-book for the Young Student. By Peter Beawell, Greenlaw. (In a few days.)

Price 1s.  
**THE ART OF TAXIDERMY;** containing a Practical Knowledge of the most improved Methods of Preserving Quadrupeds, Birds, Fishes, Insects, and other Objects of Natural History. By Peter Beawell, Greenlaw.  
 "This curious little manual of the art of preserving objects of natural history will be acceptable to the youthful student; and many humble lovers of this delightful science may be enabled, by this treatise on TaxidermY, to form for themselves a little museum at a small cost."  
 —*Manchester Advertiser*.

Price 3s. 6d.  
**THE POULTRY-YARD; a Practical View** of the best Method of Selecting, Rearing, and Breeding the various Species of Domestic Poultry. By Peter Beawell, Greenlaw.

"The Poultry-Yard" is a very useful and comprehensive work, which we can conscientiously recommend to our country friends. Mr. Beawell is a very intelligent writer, and we hope we shall live to eat a portion of many chickens, and other domestic fowls, *secundum artem*, according to his directions."  
 —*Mark Lane Express*.

Price 2s. 6d.  
**A TREATISE ON SHEEP,** with the best Means for their Improvement, General Management, and the Treatment of their Diseases. To which is Added, a Chapter on Wool, and the History and Use of the Sheep. By Andrew Blacklock, Surgeon, Dumfries. This edition contains a Chapter on Australian Sheep.

Price 3s. 6d.  
**SMALL'S VETERINARY TABLET;** being a Synopsis of the Diseases of Horses, Cattle, and Dogs; with their Cause, Symptoms, and Cure. By Matthew Small, Veterinary Surgeon, and Member of the London Veterinary Medical Society.

Price 2s.  
**THE PRACTICAL FARMER'S MANUAL;** a Popular Treatise on Agriculture. Designed to show the Tenant how they may best increase their Profits, and thereby improve their Condition in Life. By a Country Clergyman.

By J. Stewart, Veterinary Surgeon, and Professor of Veterinary Surgery in the Andersonian University.  
 W. R. M'Pherson, Publisher, Glasgow; N. H. Cotes, 139 Chancery Lane, London; and sold by all Booksellers.

Rev. C. Girdlestone's Commentary on the Bible.  
 In 8vo. price 9s. boards, the Fifth Part (containing Job and the Psalms, l.—lxxxiii.) of  
**THE OLD TESTAMENT,** with a Commentary, consisting of Short Lectures for the daily Use of Families.

By the Rev. CHARLES GIRDLESTONE, M.A.  
 Rector of Alderley, Cheshire.  
 In this edition of the Holy Bible, it has been the chief object of the Editor to furnish families with an exposition for daily reading. The Scripture is divided into paragraphs of a convenient length, and the explanatory and practical matter is digested, under each portion, into one consecutive lecture, so as to demand of the reader no previous study or attention.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.

Also, lately published,  
 Volume the First (containing the Pentateuch), price 18s.; and  
 Volume the Second (Historical Books), 18s.; or in Parts, at 9s. each.

And, by the same Author,  
**The New Testament, with a Commentary.**  
 In 2 vols. or Four Parts, price 1*l.* 16s.

**MR. BAILLIE FRASER'S**  
**Travels in Koordistan and Mesopotamia.**  
3 vols. 8vo. with Engravings.

V.  
**The Ingoldsby Legends; or, Mirth and**  
**Marvels.**

By Thomas Ingoldsby, Esq.  
Post 8vo. bound, with numerous characteristic Illustrations.  
"One of the cleverest works of the day. It abounds in wit and  
humour of the first class."—*John Bull*.  
"Ingoldsby is a sterling humorist. In the quaint mock-ballad  
style, this writer has no equal among his contemporaries. His  
humour is not only rich and nutritious, but it is also picturesque,  
and develops much of the fancy of the poet. May Ingoldsby  
write a hundred more Legends, and may we live to read them."  
—*Sax*.

VI.  
**The First Two Volumes of the complete edition of**  
**The Letters of Horace Walpole,**  
**Earl of Orford.**

Price 14s. each, bound, with numerous fine Portraits.  
"This edition will be comprised in six Volumes."  
"Horace Walpole's Letters are unequalled in the language—  
delightful in themselves, and a most amusing and instructive  
commentary on the history of the country from 1735 to 1797.  
This edition is to contain not only all that have been published,  
but several hundred letters which have hitherto existed only in  
manuscript, the whole arranged in chronological order. We  
look forward with pleasure to the publication of the remaining  
volumes, and have no doubt we shall glean from them a rich  
harvest."—*Athenaeum*.

Richard Bentley, New Burlington Street,  
Publisher in Ordinary to Her Majesty.

**MR. JAMES'S NEW NOVEL.**  
In 3 vols. post 8vo. price 1l. 11s. 6d.  
**THE KING'S HIGHWAY; a Novel.**  
By G. P. R. James, Esq. Author of "Henry of Guise;  
or, the States of Blois," "The Huguenot, Tale of the French  
Protestants," "The Robber," "Life of Edward and the Black Prince,"  
"The Gentleman of the Old School," &c. &c.  
London: Longman, Orme, and Co.

## NEW WORK BY BOZ.

In Weekly Numbers, price Threepence,

**MASTER HUMPHREY'S CLOCK**Will strike ONE on Saturday, April 4th. Handsomely printed in imperial 8vo. with  
Illustrations by George Cattermole and Hablot Browne.

CHAPMAN and HALL, 186 Strand. Sold by all Booksellers and Newsmen.

MR. COLBURN'S NEW PUBLICATIONS, NOW READY.

I.  
**MEMOIRS OF**  
**THE PRINCESS DASCHKAW,**  
Lady of Honour to the Empress Catherine II.  
Written by Herself.  
With numerous Letters of the Empress and other Royal and  
Distinguished Personages.  
Now first published from the Originals.  
3 vols. 8vo. with Portraits, Autographs, &c.

II.  
**Jack Ashore.**  
By the Author of "Rattlin the Reef," "Outward Bound," &c.  
3 vols. with Portrait of the Author.

III.  
**Colburn's Calendar of Amusements in Town**  
**and Country, for 1840.**

Comprising London Seasons and Nights—Balls, Masquerades,  
Theatres, Concerts, Public Exhibitions—Winter, Summer, and  
Harvest Sports—Cricket, Wrestling, Swimming, Skating, Rowing  
and Sailing Matches—Races, Hunt and Steeple-Chases—Shoot-  
ing Seasons—Fishing and Watering—Place Seasons—Fairs and  
other Sports.  
A pocket vol. with numerous Illustrations by R. Cruikshank,  
8s. 6d. bound.

IV.  
**Mrs. Trollope's Widow Married.**  
A Sequel to "Widow Barnaby."  
3 vols. with Twenty-one humorous Illustrations by Bass.  
"Decidedly the most amusing of all Mrs. Trollope's stories."—*Parthenon*.

Also, just ready,  
I.  
**Woman and Her Master.**  
By Lady Morgan.  
2 vols. post 8vo.

II.  
**Precepts and Practice.**  
By Theodore Hook, Esq.  
Author of "Sayings and Doings," &c.  
3 vols. post 8vo. with Portrait of Mr. Hook, and numerous  
Illustrations by Philz.

III.  
**Lights and Shades of Military Life.**  
Edited by Major-General Sir C. Napier, K.C.B. &c.  
Henry Colburn, Publisher, 18 Great Marlborough Street.

Part I. with Fifty Plates, and Seven Sheets of Letterpress,  
price 1l. 11s. 6d. plain, large 8vo.; and 2l. 12s. 6d. Proof, India  
paper, 4to.

**ODONTOGRAPHY; or, a TREATISE**  
on the COMPARATIVE ANATOMY of the TEETH;  
their PHYSIOLOGICAL RELATIONS, MODE OF DEVEL-  
OPMENT, and MICROSCOPIC STRUCTURE in the VER-  
TEBRE ANIMALS.

By RICHARD OWEN, F.R.S.  
Correspondent of the Royal Academies of Sciences, Paris, Berlin;  
Hunterian Professor to the Royal College of Surgeons, London.  
This work will appear in Three Parts, and will be illustrated  
by upwards of 150 Plates, and to be completed in the course of  
the present year.  
London: H. Baillière, Foreign Bookseller and Publisher,  
519 Regent Street.

NEW EDITIONS OF LOUDON'S ENCYCLOPÆDIAS.

I.  
**GARDENING; presenting, in one**  
Systematic View, the History and present State of Gar-  
dening in all Countries, and its Theory and Practice in Great  
Britain; and comprising the Management of the Kitchen Garden,  
the Flower Garden, Laying out Grounds, &c. &c. New edition,  
enlarged with nearly 1000 Engravings on Wood, 50s. boards.

II.  
**AGRICULTURE; comprising its History**  
in all Countries, the Principles on which Agricultural  
Operations depend, and their Application to Great Britain and  
similar Climates. New edition, with nearly 1300 Engravings,  
50s. boards.

III.  
**PLANTS; including all the Plants which**  
are now found in, or have been introduced into, Great  
Britain, giving their Natural History, accompanied by such Des-  
criptions, engraved Figures, and Elementary Details, as may  
enable a Beginner, who is a mere English Reader, to discover  
the Name of every Plant which he may find in Flower, and  
acquire all the Information respecting it which is useful or inter-  
esting. 2d edition, with nearly 10,000 Figures, 3l. 15s. 6d.  
"The most useful and popular botanical book that has ever  
appeared in the English language."—*Jameson's Phil. Journal*.

IV.  
**HORTUS BRITANNICUS; or, Catalogue**  
of Plants. New edition, corrected to March 1839,  
31s. 6d.  
London: Longman, Orme, and Co.

New and Cheap Edition.  
**PILGRIMS of the RHINE.**  
By Sir E. L. BULWER,  
Author of "Pelham," &c.  
With Twenty-seven fine Engravings, from Drawings by Mac-  
lise, Roberts, &c. Medium 8vo. neatly bound in cloth, 51s.;  
morocco, 55s.  
"This is, in all respects, a most superb book: the literary con-  
tents, which are of the highest order, being fully equalled by the  
splendour of the pictorial embellishments."—*Notes*.  
"A few copies, large paper, royal 8vo. price 1l. 11s. 6d."  
Charles Tilt, 85 Fleet Street.

Profusely illustrated with numerous Engravings, price 6s. cloth,  
**THE COMIC LATIN GRAMMAR; a**  
new and facetious Introduction to the Latin Tongue.  
"Without exception the most richly comic work we have ever  
seen."—*Tait's Magazine*.  
"For the first time in our lives the Latin Grammar has made  
us laugh."—*Morning Herald*.  
Charles Tilt, 85 Fleet Street.

NEW AND GOOD DRAWING-BOOKS.  
**PROUT'S ELEMENTARY; or, LAND-**  
**SCAPES, BUILDINGS, &c.** Six Parts, 1s. 6d.  
2. Julien's Studies of Heads. 6 Parts, 2s.  
3. Cooper's Studies of Animals. 8 Parts, 2s.

10. Andrews's Lessons in Flower-Painting.  
6 Parts, 2s. 6d.  
Charles Tilt, 85 Fleet Street.

Cheap edition, 7s. 6d. cloth, gilt edges, 10s. 6d. morocco,  
very neat.  
**MAY YOU LIKE IT; a Series of Tales**  
and Sketches.  
By the Rev. C. B. TAYLER.  
Author of "Records of a Good Man's Life." With Plates, &c.  
"This popular work, originally published in 2 vols. 16 mo  
handsomely printed in one, with a view to its extended circula-  
tion. It is admirably adapted for a present to the young."  
Charles Tilt, 85 Fleet Street.

NEW EDITIONS OF MRS. MARCET'S CONVERSATIONS.  
**NATURAL PHILOSOPHY, in which the**  
Elements of that Science are familiarly explained, and  
adapted to the Comprehension of Young Pupils. 9th edition, en-  
larged and corrected, 23 Plates, fcap 8vo. 10s. 6d. cloth, lettered.

**POLITICAL ECONOMY; in which the**  
Elements of that Science are familiarly explained. 7th  
edition, revised and enlarged, 1 vol. fcap 8vo. 7s. 6d. cloth, lettered.

**VEGETABLE PHYSIOLOGY; compre-**  
hending the Elements of Botany, with their Application  
to Agriculture. 2d edition, 1 vol. fcap 8vo. 9s. cloth, lettered.

**LAND and WATER. 2d edition, revised**  
and corrected, 1 vol. fcap 8vo. 5s. 6d. cloth, lettered.

**CHEMISTRY; in which the Elements of**  
that Science are familiarly explained, and illustrated by  
Experiments. 18th edition, enlarged and corrected, 2 vols. 12mo.  
18 Plates, 14s.  
London: Longman, Orme, and Co.

In 4 large vols. 8vo. price 3l. 3s. in boards,  
**ECCLESIASTICAL BIOGRAPHY; or,**  
Lives of Eminent Men connected with the History of  
Religion in England; from the Commencement of the Reforma-  
tion to the Revolution. Selected and illustrated with Notes,  
By the Rev. CHRISTOPHER WORDSWORTH, D.D.,  
Master of Trinity College, Cambridge; and Rector of  
Buxted with Uckfield, Sussex.  
3d edition, with a large Introduction, some new Lives, and  
many additional Notes. Printed uniformly with the "Christian  
Institutes," by the same Editor.  
J. G. F., and J. Rivington, St. Paul's Churchyard, and  
Waterloo Place, Pall Mall.

Printed by HANNAH PAGE MOYES, of Brook Green, Ham-  
mersmith, and GEORGE BARCLAY, of Number 3 Pullin's  
Place, Islington, both in the County of Middlesex, Printers,  
at their Printing Office, Number 28 Castle Street, Leicester  
Square, in the said County; and published by WILLIAM  
ARMIGER SCRIPPS, of Number 13 South Molton Street,  
in the Parish of Saint George, Hanover Square, in the County  
aforesaid, at the LITERARY GAZETTE OFFICE, Number  
7 Wellington Street, Waterloo Bridge, Strand, in the said  
County, on Saturday, March 28th, 1840.

#### REVIEWS OF NEW BOOKS.

*Scotland and the Scotch; or, the Western Circuit.* By Catherine Sinclair, author of "Modern Accomplishments," "Hill and Valley," &c. &c. 12mo. pp. 348. 1840. Edinburgh, Whyte and Co.; London, Longman and Co.; Hamilton, Adams, and Co.; Duncan and Malcolm.

THIS is one of those volumes which only a clever, intelligent, and observant woman could write. Of a little to make a meikle is most laudable housewifery; and in literature to do the same, and further to make the meikle good, is an achievement to merit the reader's and the critic's praise. The authoress has a well-stored mind, and the power of applying its accumulated treasures happily enough in anecdotes and other illustrations of her immediate subjects. This gives a very agreeable cast to her productions, removes all dryness, and fairly exemplifies that sort of light and amusing communication which it is evidently her object to establish between herself and the public. The present tour or "circuit" is of no great extent, but it is described so well that we have great satisfaction in recommending it to the world with the following certificates extracted from the work itself. Miss Sinclair is writing of Mount Stewart, the family seat of Lord Bute in Rothesay, and she informs us:—

"A droll, fantastic-looking picture of Lady Mary Menzies, served as a curious memorial of fashions long since extinct, with her little pink hat whimsically perched on one side of her head, a pink velvet habit, and such a waist!—a sharp east wind would have cut her in two! She has a shepherdess's crook and a pet lamb beside her; but if all that is said be true, a pack of cards would have been more appropriate, as many acres in Perthshire changed hands through her shuffling and dealing. She was sister to the prime minister, and had no family. Ladies, long ago, exhibited more peculiarities of character than now, when the stamp of nature is polished off, like a well-worn shilling, and all seem exactly alike; but among those we saw on canvass here, none interested my curiosity more than the beautiful and eccentric Duchess of Queensberry, who had a strange delight in going about incog. like Haroun Al-raschid, dressed frequently as a dairy-maid; and in this portrait her costume is very little above that of a house-maid. A whimsical proof of her skill in tormenting was shewn when country neighbours came equipped in their very best dresses to visit her grace. She decoyed them out along the dirtiest roads, wearing her own cottage costume, and making the whole party sit down occasionally on any damp grass or mouldy walls that seemed most certain to ruin their finery. No fictitious tragedy could be more melancholy than that in which her manœuvres involved the Marquess of Drumlanrig, her son, who was engaged to marry a very lovely and estimable young lady; but the duchess contrived to intercept their letters; persuaded the disappointed lover, during a prolonged absence, that Miss Mackay had actually married another, and hurried him into a union with the lady her grace preferred. Immediately afterwards, the Marquess met the

object of his earliest choice, and discovered the cruel deception his mother had practised upon him. On a journey with his bride, scarcely three months after their union, he shot himself, and the widowed marchioness did not long survive. No excuse can be pleaded for the duchess, unless the report be true, that she was confined during some part of her youth in a strait jacket. Miss Mackay afterwards became Mrs. Macleod of Talisher, in Skye; and an old clergyman there, in describing her to me, observed, that she had become one of the most admirable women in her time, 'fit not merely to have been a duchess, but an empress.' There are two fine gardens at Mount Stewart, one for use, and the other for ornament. In the kitchen-garden, the apricots and turnips seemed to promise equally well; and we discovered one fig-tree, with about two hundred figs, while others close by, with the same advantages, bore nothing but leaves, forming an excellent exemplification of the text, 'by their fruits ye shall know them.' It is an interesting remark of Bishop Hall's, that our Saviour, after exhibiting so many miracles of mercy to mankind on earth, chose at last to exemplify the future vengeance of God against sinners, not upon a living man, but, with characteristic goodness, he cursed only a tree. We could not catch a cicerone any where, to do the honours of the fruit and vegetables, till at last a boy of fourteen appeared, smoking his pipe; and he seemed to have smoked away any brains he ever had, being most incomparably stupid. I once heard a patriotic Scotch gentleman exclaim, when he had applied to several persons in vain for information, 'These people are as stupid as if they were English!' but this juvenile smoker knew nothing about any thing, and would have been disowned in every country. He was fit for no better employment than to sit under a gooseberry bush with his pipe, smoking the caterpillars to death. The boy was lazily doing what I suppose he called work; but it made me sad to see a habit acquired at so early an age, which will rob him in after-years of health, money, and time. I wish King James's 'Counterblast against Tobacco' were republished! How invariably we see, in every village, the little shop-board advertising 'Tea, snuff, and tobacco'; those three ruinous luxuries of the poor, on the more moderate use of which it would be well if divines would occasionally both write and preach. About 80,000*l.* is annually received in Aberdeenshire for black cattle, and a similar sum is every year expended in that county on tobacco and snuff! The very flies must be sneezing as they go along! Few people are aware to what a frightful excess the vice of opium-eating has extended lately in this country, and how rapidly it is increasing both in England and Scotland. I could name one apothecary's shop, where innumerable small packets, costing only a penny, of this pernicious drug, are prepared every night, and where a crowd of the wretched purchasers, many of them women, glide silently up to the counter, deposit the price, and, without uttering a word, steal away, like criminals, to plunge themselves into a temporary delirium, followed by those agonies of mind and body by which both are

at last distorted and ruined. We have all read the English Opium-Eater's 'Confessions,' who took laudanum toddy after dinner for his refreshment! The fascinations of this drug are like those of the snake, whose victims see their impending destruction, and yet cannot resist the fatal impulse to go on.

"In the garden we really had a perfect carnival of birds as well as of flowers. It was quite a bird concert, and one little songster poured out such a flood of harmony, that, if not a nightingale, he deserved to be one. Neither Pasta nor Rubini have a shake to compare with him! What a saving of labour it would be, if we were all born ready-taught musicians as birds are; instead of ladies being bound apprentices to music for nine good years of life, that they may learn to play perplexing tunes with impossible variations, carefully acquiring 'nimble fingers and vacant understandings.' It has been quite a calamity to the middle classes, that every farmer's daughter now must indispensably learn jingling, for it cannot be called music when played on such cheap pianos as they can afford, tuned only once a-year, and sounding at best like a poker and tongs. Poor Strauss and Rossini! I was amused to hear lately of a music-master, unable to endure indifferent scholars, who taught on dumb pianofortes, and only treated his pupils to audible ones when they played so as to afford him pleasure, which in some cases would be never. I called some years since at a farm-house, built, like all its contemporaries, on a scale out of proportion to the rent. There the young 'ladies' had left their milk-pails to practise the Swiss 'Ranz des Vaches,' and played 'Corn-riggs,' instead of cutting them; but it was an amusing mixture in the large empty unfurnished drawing-room to see a pianoforte standing at one end, and a pile of carrots and turnips at the other. Our obliging cicerone, the gardener at Mount Stewart, was rather *ad libitum* in his pronunciation of names, and when shewing us a very beautiful peony-tree, he remarked that it produced every season a great many 'fine pianos!'"

In this characteristic and variegated manner we find every matter treated, and a like combination of naïve remark, sound judgment, and sensible information. On graver points a graver tone is taken; thus, for instance, on the Intrusion question, which now agitates and divides the whole of Scotland. At Muckairn the author says:—

"Here I was surprised to observe an excellent church and manse, in most deplorable disorder, the shutters all closed, the garden a picture of desolation, and every thing apparently testifying that some great calamity had occurred to cause their being thus forsaken, therefore we applied to the innkeeper, and afterwards to the parish schoolmaster, whom we found digging in his own garden, to enlighten us, as to what had caused this melancholy aspect of affairs. It turns out to have been all occasioned by a veto perplexity, which has kept this parish unoccupied during two years. The church of Muckairn is in the gift of government, and a vacancy having occurred in August 1837, four clergymen named by the state arrived to exhibit their powers in the

pulpit, for the purpose of pleasing their auditors, and gaining their election to the vacant charge. Not one of these candidates, however, gave, or could by possibility have given, the smallest satisfaction, because the congregation had previously determined to favour a farmer's son in their own neighbourhood; and thus it has happened, as in old times, when a partial veto law was once allowed to exist, that parishes remained vacant sometimes for several years. Meantime, one of the four government nominees at Muckairn has collected, after great canvassing among the numerous persons entitled to vote, eight signatures, which are intended to pass for a 'harmonious call,' in consequence of which our informants seem to think this active candidate will be precipitated into the pulpit at Muckairn. At present that parish has fallen into a state of temporary heathenism, having only been favoured with miscellaneous preaching one Sunday in three weeks from the Argyllshire Presbytery, so that the poor ignorant Highlanders may be apt to say like the American peasants, 'We are not Christians, because we have no opportunity.' As no clergyman's principles and abilities, even in respect to preaching, can be duly weighed at a popular election or rejection, to be decided by a single sermon, private visitation of the sick and dying, which is far more laborious and equally important, may probably fall into great disuse, and meantime the poor people of Muckairn are, in many instances, now sinking into the grave without benefit of clergy. There surely must be something amiss in any law which produces so lamentable a result; and, therefore, even if it be the law of the land, there seems no advantage in reviving it. In the supplementary chapel of A—, a case, somewhat similar to that of Muckairn, lately occurred. Three candidates were named to compete before the people, two of whom gained over large bodies of keen partisans, but the third had only one advocate. An eager contest arose, much angry feeling ensued, each party threatened to become Dissenters, and at last the solitary supporter of the unpopular candidate, by hinting to each party how very probably the opposite faction might succeed, induced a majority to adopt the neutral plan, of fixing on the individual who had been at first so unanimously rejected. Thus the single-handed partisan worked on the evil passions of others, to bring in one who took comfortable possession of the vacant chapel, and has done the parish duties there ever since. We had already passed a parish which had become vacant during the late Duke of Argyll's life, who received the recommendation of a suitable successor, from a pious and esteemed landed proprietor in the neighbourhood, to whom his grace returned an answer, that being pledged to support the veto law, he had determined whichever candidate sent him a requisition, signed by the largest majority of voters, should receive the presentation. One of the clergy went off, on hearing this, to the 'shinty' ground, where the parishioners were assembled in great numbers at play, and gave a glass of whisky to each of those who would sign a petition in his own favour, by which means he gained the election. I know of one vote in a vacant parish having been gained over from the opposite side for a pound of tea, and if a hundred votes could be secured at the same price, supposing the tea eight shillings a pound, it would require but little arithmetic to calculate how very cheaply a living in Scotland might soon be purchased by bribery. When Mr. Gladstone generously offered a church, a school, and an endowment

at his own expense to the established church of Scotland, a majority of pious and learned clergymen, who had been themselves placed in pulpits by the influence of patrons, thought it better to reject these important gifts, rather than allow the continuance, in one instance, of that power by which they had themselves been chosen; and this principle is about now to be carried out respecting the whole of Scotland, where most of the churches were gratuitously reared by landed proprietors, whose representatives have since been patrons; yet the very existence of our national establishment seems apparently considered of no consequence, if the clergy and patrons alone continue responsible for the choice of ministers, unless the people have power superior to both."

Miss S. seems to have met with worse entertainment at Fort William than we have done; for, in truth, we found at the inn there, with its character of a landlord and Prince Charles's uniform, and his intelligent son as guide and driver, a great compensation for the toil of ascending, and greater toil of descending, Ben Nevis. So true it is that few tourists see or take things in the same light; much depends on their own frames of disposition. But true to observations, and let us get at a few specimens of the smart and pleasing with which these pages abound. At Tarbert, where the Campbells also abound, Miss S. relates:—

"Strangers here are much perplexed by the universal custom of calling proprietors by the name of their estates, which is necessary on account of every gentleman bearing the same surname. A Miss Campbell who married once in Norfolk, brought her husband to visit in Argyllshire, and soon afterwards at a dinner party, the host politely asked his guest to take wine, adding 'Machrelanish, Auchnacraig, Drumnaclock, Achadashenaig, and Fasnacloch, will join us!' The bewildered Englishman could not conceive what these uncouth sounds might mean, till he hastily glanced round the table, and saw five eager faces looking towards him, with cordial smiles, and extended glasses!"

Of Kilchurn Castle we have a nice legend, moralized by some judicious remarks:—

"It was garrisoned by Lord Breadalbane in 1745, but has since been struck by lightning; and now a more picturesque ruin you could not desire to behold in a long day's journey. The fragments remaining are both extensive and irregular; besides which, they belong to a story which might have been worked up into a tolerable novel, or a first-rate ballad, if Sir Walter Scott had found time to enlarge and embellish the incidents with a few of his own peculiar touches; but it would really require a forty-Scott power to illustrate all the romances of real life we have heard in this neighbourhood. The legend of Kilchurn Castle is an old story, but wears well, being the more interesting as it relates to the Lord of Argyll's second son, who founded the family of Breadalbane. This fine old edifice was begun by the first Lady Campbell of Glenorchy, during her husband's absence, whose affairs having become embarrassed; he had gone abroad to serve as a Knight of Rhodes. In foreign warfare he distinguished himself extremely; but nothing more being heard of him during so long a period in his own country, his lady, who had become very affluent, began to imagine herself an inconsolable widow, and determined not to remain so long. You have heard of Mrs. P—, who played at cards with her lover the year of her husband's death, staked her grief, and lost it! Now the process in

Lady Campbell's case seems to have been quite as summary, seeing she recovered her spirits on the shortest possible notice, and entered into a new engagement; but before it could be fulfilled, Sir Colin was in full progress homewards, expecting a rapturous reception on his return. Having one evening joined a jovial party at an inn on the road, he was shocked to hear a gossiping discussion respecting his own supposed death, his wife's projected marriage, and the splendid new castle at Kilchurn, all of which seemed to his astonished ears so entirely fabulous, that he must have felt on this occasion nearly as much out of place as the man who attended his own funeral. Nothing is more irritating than to have your news disbelieved; and the stranger who related these interesting and authentic particulars became highly indignant at the apparent incredulity of his companion, who seemed, as the Highlanders say when thoroughly perplexed, 'unable to make top, tail, or meal of it;' therefore he turned to Sir Colin, and inquired what he would give to receive certain proof before next day that all he had related was true; and having been promised an adequate donation, he instantly disappeared. Next morning, before Glenorchy was awake, the messenger stood by his bedside, roused him, and repeated the story as he had told it before; but seeing his auditor still sceptical, the incognito angrily produced Lady Campbell's wedding-ring, bearing Sir Colin's name and her own on the circumference, and confessed, that to prove he had really been within Kilchurn Castle, he had stolen it off her finger while she slept. Our guide, when he related this part of the tale, gave a superstitious shake of the head, and remarked in an under tone, that 'certainly this extraordinary stranger was no' canny.' The knight immediately sprung upon his horse, galloped off at full speed, and reached Kilchurn Castle the very day and hour when his successor was to have been declared duly elected. In the disguise of a beggar, he surveyed the castle, and applied so importunately at the gate for leave to see Lady Campbell, that the Highland servants thought it would be 'unlucky' to refuse; therefore they prevailed on her to appear for a moment. A well-filled cup being brought to him, the beggar was desired to pledge a bumper to the bride-elect, which accordingly he did, and after draining the last drop, he slipped the wedding-ring into the empty goblet, and presented it to Lady Campbell, who instantly observed the token, gave a startled glance at the stranger, and recognised her long-lost husband. We may suppose, though tradition does not enter into particulars, that hysterics and all sorts of fine feelings ensued, and like the conclusion of most fairy tales, they lived happily ever afterwards. During the present day such a termination would scarcely be tolerated, as husbands make a very poor figure in most novels, which seem generally written to defend the misconduct and inconstancy of ladies. We find the Charlotte and Werter school of morality coming rapidly into fashion of late, in which every wife, with a splendid home and magnificent establishment, is an amiable martyr, who thinks herself so unsuitably matched, that it seems inconceivable how she ever got into the scrape of being married at all, and she finds no harm in confiding her sorrows and persecutions to some sympathising paragon of a cousin, or discarded lover, for whom she feels nothing except grateful regard, but with whom she of course runs off at last, and the reader is expected to suffer agonies of pity and commiseration, on account

of a *dénouement* which the whole course of the heroine's conduct and principles had rendered inevitable from the commencement. It was a good rule, promulgated long ago, that every lady should suppose there is but one good husband in the world, and that she has been fortunate enough to marry him, but modern heroines are all made to think exactly the reverse. The cottages in this part of Argyllshire are small and dilapidated, like ruinous bee-hives, the straw roofs being held on by ropes, to the ends of which heavy stones are attached, resembling, as Dr. Johnson said, 'a row of curl papers.' The common people seem generally a very diminutive race, with hair as black as their cattle, but have good features, and their manners are civil and obliging. In respect to dress, shoes, stockings, and bonnets, are not much worn, and the fashions for this month are white muslin caps, dark cotton gowns, made short and scanty in the skirt, and neither leather nor prunella for shoes; but I always maintain, that for hard-working people, the custom is both wholesome and cleanly, of having their bare feet washed daily, or perhaps hourly, in every stream they pass. We were amused to hear that a Mahometan, seeing some women once, who had walked nearly to church, hastily bathing their feet before drawing on their shoes and stockings, gravely remarked how different were the sacred ceremonies in various countries; for he had always been accustomed to throw off his slippers before entering a sacred edifice, but here he observed that our religion enjoined people to put them on. What strange and laughable mistakes may be committed by even the most intelligent travellers, when they make a few superficial inquiries, in passing through a new country! An English clergyman, anxious to make himself acquainted with our customs, and especially with Presbyterian opinions, but not knowing enough of our dialect to be aware that, in many parts of the north, the letter 'i' is pronounced like an 'e,' stopped one day where some women were collected round a pond of muddy water, preparing it, in fact, for steeping lint, and inquired anxiously what they were doing. The reply led him to suppose that some unheard-of penance was inflicted in the Highlands at particular seasons, as the women replied, with one accord, 'We are preparing for lent, sir!' I was amused to be told that old Lady Perth, indignant at hearing a Frenchman speak contemptuously of porridge, angrily interrupted him, with an allusion to her national horror of frogs, saying, 'Tastes differ, sir! some folks like parritch, and others like puddocks.' On another occasion a stranger was amazed to hear a strict divine, when intending to inculcate on his congregation the propriety of receiving a hint properly, delivered his advice in these words, 'My friends! be ready at all times to take a hunt;' and I remember seeing an Englishman quite perplexed, when told at a party in Scotland, that all the guests were 'kent people,' not meaning to imply that they came from the county of Kent, but merely that they were well-known personages. In Scotland a sore is called an 'income;' and an English tourist would be rather perplexed if a beggar came up to him, as an old woman did one day to me at Portobello, asking charity, with a most pitiable countenance, 'because she had a great income on her hand.' A legacy to any charitable fund is called a 'mortification;' and you might hear a truly benevolent person say, in tones of exultation, that 'he is happy to hear the blind

have got a great mortification in Mr. Smith's will.' If a Scotch person says, 'will you speak a word to me,' he means, will you listen; but if he says to a servant, 'I am about to give you a good hearing,' that means a severe scold. The Highland expression for two gentlemen bowing to each other, amused us extremely on a late occasion, when a Scotchman said to his friend, 'I saw your brother last week exchange hats with Lord Melbourne in Bond Street.'

About whisky (near the magnificent Glenoe) Miss S. lets some secrets escape:—

"Nothing can be more ingenious than the contrivances by which Highlanders manage to conceal small stills for manufacturing their favourite *'vin du pays'*, though sometimes the secret is betrayed when cattle are attracted to the spot by a smell of grain. The most popular whisky is made clandestinely, without a government license, and goes by the name of 'moonlight,' while that which pays duty is called 'daylight,' and is considered so contemptibly inferior, that even his Majesty George IV., during his residence in Edinburgh, drank the 'mountain dew,' in preference to the 'parliament whisky.' One very small 'still' was discovered in the Highlands last year, with the boiler buried beneath a stone gate-post, which had been hollowed out for the chimney; and another was detected within the precincts of a Roman Catholic chapel, where the priest connived at the trick, and sold whisky to a gentleman, who mentioned the circumstance, under the name of 'holy water.'

[To be concluded next week.]

#### BOX.

THIS day WE, the *Literary Gazette*, are twelve hundred and eleven weeks old; and this day our friend and contemporary *Box* begins a weekly existence. Behold the infant by *Master Humphrey's Clock*—nine minutes to 12 p.m. by the outside dial; and about eleven minutes past, by Cattermole's admirable time-piece in the Chimney Corner inside. As in Lover's choice song of the birth of St. Patrick (between the disputed 8th and 9th of March, which the worthy priest settled by adding them together, and thus making the saint's day the 17th), it will in future years be difficult to tell

If the Clock were too fast  
Or the Baby too slow!

but nevertheless the child be a fine and thriving one, with a memory as long conserved and admired as Saint Patrick's own, which has lasted a good many centuries. In our serene old age, twenty-three years and a half, *Periodical time!* we hasten to welcome the Neophyte; and heartily to wish that, at the end of as long a space, it may continue in the full enjoyment of vigour, health, and happiness, the highest public favour, and "troops of friends" in every quarter of the globe.

We are not captious with our younger brethren, who have grown up, as it were, under the shadow of our wing; and some of them, like chickens with a parental old cock, or hen, apt enough to mount upon our back as we lie in the sun, pecking at the *graveling* morsels of science, or fluttering about the circumambient dust of *litterature*; but we shall take the only opportunity that may be offered to us of extending our benign patronage to Master Humphrey, which we can now do to *No. I.* seeing that he has not yet exhibited any *Parts*. From the appearance of our sixteen pages, we may do the condescending and courteous to a little thing that has only twelve; though he be backed by Gog and Magog, the wooden

Giants of Guildhall, whose story is commenced after the clock, and its master, &c. have been described. And, *à propos* of these giants, who among our readers recollects their famous dialogue when Alderman Wood, a namesake, was installed as civic chief of the city?—

Gog loquitur.—"We three

Loggerheads be,  
With plenty of Wood to spare!  
I am Gog,  
You're Magog,  
But who, sir, is the other Loggerhead? Ask the Lord Mayor!"

Yet has this nothing to do with Box and his new and pleasantly opened undertaking. It is, indeed, a birth of great promise—of such excellence as might be expected from a writer so justly popular, who, if he has done us the honour to adopt a *Weekly* course, must, even at first sight, be acknowledged as a most delightful pick-Week.\*

*The Effect of the Corn Laws on the Price of Human Food and Manufactures Considered; shewing that their Repeal would be equally Injurious to the Landowner and Manufacturer.* By James Duthie. 8vo. pp. 16. London, 1840. Stephenson.

THIS is a very short, but a very sensible and straight-forward view of this important question. Mr. Duthie is a strenuous advocate for protection to the corn-grower, and brings facts and practical observation within a narrow compass in support of his argument. His epigraph is a curious opposition of two opinions:—

"Agriculture is the parent of our commerce and manufactures, and has raised this great country to the proud station it now holds. Live and let live should be the general maxim, and none should desire to raise his own prosperity on the downfall of another."—*Marquess of Chandos.*

"The root—the true source of all our wealth and greatness, is our manufactures and foreign commerce."—*C. Poulett Thomson, Esq.*

In his own words, Mr. D. says:—

"The object of the following observations is to endeavour to shew that the duty upon imported corn can scarcely be said to enter into the expense of the production of manufactured goods; and that, were the duty entirely abolished, it would not benefit the manufacturer. These two positions are attempted to be established by the fact, that under the existing law the artisan only pays 4½d. per week more for his bread than he would do if the duty were entirely abolished; and that, even if the manufacturer had the advantage of importing every bushel of corn consumed, he could only exchange for it 21,050,000 worth of manufactured goods."

He goes into estimates in proof of these positions, and thus concludes:—

"According to the rate of increase in the population, which took place between 1820 and 1830, the population of Great Britain would, in 1835, have amounted to seventeen millions; and each person consuming 6½ bushels of wheat, the entire consumption of the country would have been 13,281,250 quarters: now, had our manufacturers imported every quarter consumed, they would not have given in exchange more than 21,050,000 worth of manufactured goods—not half the amount which the growers at home of the 13,281,250 quarters take from them. To transfer the supply of corn from the British landowner to the manufacturer, would be virtually to constitute the latter foreign landowners to the extent of the number of acres necessary to supply our home demand for corn, and give them a directly opposite interest to that of the British land-

\* *Master Humphrey's Clock.* By Box. No. I. Imperial 8vo. pp. 12, with illustrations by G. Cattermole and H. K. Browne. London, 1840. Chapman and Hall.

owners. The main object of the British landowner is to produce the most abundant crops; the interest of the manufacturer would be to limit the supply in order to enhance the price at home; for, although he would be virtually a foreign landowner, yet, having embarked no capital in its purchase, his rent would not depend on the prosperity of the growers, but on the price which he could exact from the consumer; and the more limited the supply, the greater would be his power of exaction. On which of these interests, therefore, would the British public feel disposed to throw themselves for the supply of bread? the cost of production, the factor, the merchant, and the baker, already monopolise 11-12ths of its value, leaving the landowner and tenant a mere shadow of interest. This is a startling fact, and capable of proof; but which, so far as the observations of the writer went, was never touched upon in the four days' debate of 1839. An acre of land of ordinary quality will, on an average of years, grow three quarters of wheat; the bread made from the wheat grown on an acre was sold in London, during the seven years ending 1835, for 12l. 10s. 9d. (the four-pound loaf then averaging 8½d.) and the actual cost of producing the wheat (which the farmer sold for 8l. 8s. 9d.) was 6l. 15s. 7d., leaving only 1l. 13s. 2d. to be divided between landlord and tenant; of this sum 22s. 1d. may be supposed as falling to the landlord, and 11s. 1d. to the tenant: so that the share of the value of the loaf which fell to the landlord was three farthings, that to the farmer two farthings, and that to the factor, the merchant, and the baker, 2½d.; the remaining 4½d. being the cost of production."

*Playing About; or, Theatrical Anecdotes and Adventures, with Scenes of General Nature, from the Life; in England, Scotland, and Ireland.* By Benson Earle Hill, author of "Recollections of an Artillery Officer," "Home Service," &c. &c. 2 vols. 12mo. Printed for the Author. London, 1840. Sams.

"PRINTED for the Author" are words which would disarm criticism, were it provoked by any offence; and "by Subscription" is another tug at the critic's heart, which puts his head out of the question. These volumes are truly light,—the shreds and patches of dramatic life and travel, which the memory and the scrap-book have thrown together, for the amusement of an indulgent public. Mr. Hill unfortunately abandoned his profession and a commission in the Royal Artillery, for the sake of indulging his predilections for the stage, and embracing the precarious career of an actor. In other pursuits mediocrity may be easy and comfortable; but in this, nothing short of eminence can compensate the many sacrifices it requires. And these sacrifices must be the greater if the individual who makes them has previously occupied the station of a gentleman, and mixed with society of that order. Our author seems to have felt this painfully throughout his uncertain and uncheering struggles for histrionic fame. The Artillery Officer is ever fighting with the Mime; and soreness of mind and disappointment of expectations are the inevitable consequences.

The most laudable portion of the book is the constant and warm demonstrations of a brother's affection for an equally deserving and affectionate sister; the most disagreeable parts, those which relate to continual worries (of words the most expressive), and the wretched fate of a person known to many in the dramatic and literary circles by the name of William

Grenville Graham, to whom Mr. and Miss Hill appear to have been strongly attached.

We will not offer any of these matters to our readers, but select a few airy trifles which may serve to recommend the work, though we are induced to hope that a kindly feeling towards the writer will do much more to incline the public in his favour.

Mrs. Orger's advice to the player (Hill, when he made his *début* at Worthing), if not equal to Hamlet's, is nevertheless to the purpose:—

"A very fresh fish (he tells us) I soon began to find myself in my new 'element,' where I had to struggle for a living. Mrs. Orger had seldom obtruded advice or corrections on the military amateur; but now, that both were essential to my interests, she rendered them more agreeable than could have been expected. 'A little louder, and not quite so fast at night; your voice only wants management and practice. You have the slightest—not lip—the reverse—don't hiss yourself! nay, 'tis nothing. We know popular comedians with 'Batter Stuff' doses,' or young 'Yapids,' with no R—s!' Though I had played Tangent often, impulse, at rehearsal, drove me from the text. Again my handsome mistress whispered, 'You must not be a vampire; that's what we call those who vamp, or patch an author's language with their own. Pray likewise remember, that if you do introduce exclamations, they should not include the name of God, or you will have the spirit of wrath descending like a goose. Talking of that, you ought not to dine later than four.' Mr. Thompson, who told me that he daily 'took an anti-corpulent walk, because he was engaged for the sick baronets,' congratulated me on there being 'no newspaper in the parish of Broadwater.' If I then thought his felicitations gratuitous, nay, satirical, experience soon convinced me that what he said was both friendly and wise."

An epigram at the same place explains its own point:—

"Worthing had one popular chemist, and one fashionable doctor; on these a punster wrote—

'Taken very ill on Sunday,  
Still I hope relief by Monday;  
If Monday fail to ease my sorrow,  
Undimmed I trust to Morrah.'

An anecdote to match:—

"At a gardener's gate, a little way out of Bath, had long hung a board, on which was painted these scarcely intelligible words:—'Do rabbits taken in here to brede by me James Ivins and ushal charges.'—'So much for Bucking 'em!' had been added in chalk by some Shaksperian wag."

We find some slaps at the Mathews' family, Mr. Warde, &c., which we forbear to particularise; and also hits at other parties and their productions, which we leave to the readers of these volumes. Respecting Graham we shall copy only one paragraph, knowing the fact to be true:—

"Three days (Mr. H. says) did not elapse ere I was in London, at the Wrekin. There I saw, slowly sauntering towards me, a figure dressed in the extreme of fashion, his face half-concealed by curls and Virginian beard. 'Ah, Belsol,' he drawled, holding out two gloved fingers, 'how do? why you are looking very seedy.' This was Graham, deeply in my debt, so changed, so cold, so shamelessly degraded! I asked why he had not attended to the business between us. 'Oh!' he yawned, 'I rather imagine it was from my being lored with a girl, who would live with me, till I beat, and

turned her out; and one day, soon after, I saw a nasty sight, in a hack chariot, so stopped the man. His very foul fare was this same individual, who had cut her throat too little, after taking laudanum too much. So, you know, I had to cure, and send her back to her relations, who, I understand, have married her to some clerical person. But that was the mess which kept me from minding you, Benson!' Graham turned fop, libertine, ruffian! profligate without passion, unmanly without violence of temper!"

Hill's trip to Edinburgh seems to have been one of his most agreeable essays; but he sadly murders Scotch and Scotch stories. *Er. gr.* On the king's visit to Scotland, he tells us:—

"On that august occasion an ancient privilege was claimed by the chief of the Breadalbane Pipers, to play before the king, when or wherever he went about in state. The minstrel's boon was not denied. He blew up the rant of his clan. Its words begin,

'Geordie sits in Chairlie's chair,  
Deil tak them wha set him there!'"

The Campbells were the most adverse on the other side; but we need not comment on a performance of this "playing about" order, and therefore have only again to bespeak the public kindness to its author.

#### FORBES'S ELEVEN YEARS IN CEYLON.

[Second notice: conclusion.]

THE remains of the old cities and splendid capitals of the island are in a state of great mutilation and decay; or, covered with the rank luxuriance of a moist and hot climate, their traces are no longer to be found, as in drier soils. Specimens of sculpture, as well as inscriptions, were, however, explored in various places by our author; and he tells us:—

"In the neighbourhood of Kurunaigalla I found sculptures of elephants, lions, and an animal resembling the heraldic unicorn, having the legs and body of a horse, and a horn shaped like the tusk of an elephant. If the unicorn (called kangawena by the Cingalese) ever existed, it is extraordinary that no remains of it should have been discovered; if it never did exist, the general belief of such an animal, and the near identity of its form in the sculpture and description of different countries, is equally unaccountable, for the light figure of a unicorn could never have been derived from the clumsy carcass of a rhinoceros."

"The following is translated from an ancient native account of Anuradhapura:—'The magnificent city of Anuradhapura is resplendent from the numerous temples and palaces whose golden pinnacles glitter in the sky. The sides of its streets are strewn with black sand, and the middle is sprinkled with white sand; they are spanned by arches bearing flags of gold and silver; on either side are vessels of the same precious metals, containing flowers; and in niches are statues holding lamps of great value. In the streets are multitudes of people armed with bows and arrows; also men powerful as gods, who with their huge swords could cut in sunder a tusk elephant at one blow. Elephants, horses, carts, and myriads of people, are constantly passing and repassing: there are jugglers, dancers, and musicians of various nations, whose chanque shells, and other musical instruments, are ornamented with gold. The distance from the principal gate to the south gate is four gaws (sixteen miles); and

"Arches formed of areka-trees split and bent, or of some other pliable wood, were always used in decorating entrances and public buildings on days of ceremony or rejoicing; but I have never seen an arch of masonry in any Cingalese building of great antiquity."

from the north gate to the south gate, four gaws: the principal streets are Chandrawakka-wi-diya,\* Rajamah-widiya,† Hinguruwak-wi-diya, and Mahawelli-widiya.‡ In Chandrawakka-widiya are eleven thousand houses, many of them being two stories in height; the smaller streets are innumerable. The palace has immense ranges of building, some of two, others of three stories in height; and its subterranean apartments are of great extent.”

An ascent of Adam's Peak is interesting, but we not long since noticed one more recent, and shall therefore now select a few brief extracts relating to natural phenomena:—

“Here, as in several other parts of the country, we saw myriads of butterflies passing in a continued stream in the same direction. I have observed these flights to continue for days together in different parts of the country, and that it sometimes consisted of various-coloured butterflies, but generally proceeding in a direction towards the centre of the island. The natives believe that their destination is Adam's Peak; and from this circumstance I presume it is that the Cingalese name for a butterfly is derived, viz. Samanaliya.

“On our return to the rest-house, we commenced divesting ourselves of the leeches, and then tried to stanch the bleeding of their wounds: we had been warned against plucking off these creatures forcibly and suddenly, as tending to irritate the wound, but we found that touching them with brandy instantly made them drop off; salt, gunpowder, or lime-juice, produced the same effect, but not quite so quickly. The Ceylon land-leech is incredibly numerous on the hills, and such parts of the interior as are exempt from a long continuance of dry weather: they are of a brown colour; their usual size is about three-fourths of an inch in length, and one-tenth of an inch in diameter; they can, however, stretch themselves to two inches in length, and then are sufficiently small to be able to pass through the stitches of a stocking. They move quickly, are difficult to kill, and it is impossible to divert them from their bloody purpose; for, in pulling them from your legs, they stick to your hands, and fix immediately on touching the skin, as they are free from the scruples and caprice which is sometimes so annoying in their medicinal brethren. They draw a great deal of blood; and this, with considerable itching, and sometimes slight inflammation, is the extent of annoyance which their bites give to a man in good health; but animals suffer more severely from their attacks, and sheep will not thrive in pastures where there are leeches.”

The natives are queer but tolerable surgeons. *Ex. gr.:*—

“Between Payamadoe and Tamenawillé we had an opportunity of witnessing a curious specimen of native surgery,—the putting in an ankle-joint which had been dislocated: the poor man who had met with the accident seemed to be suffering great pain; when a headman, who practised the healing art, set to work with peculiar gravity, promising to repair the damaged limb. He first secured the unlucky man's shoulders to one tree, and the foot of the injured limb was made fast to another by a double rope; through this double the headman passed a short stick, which he afterwards twisted round and round until he had tightened the cord and stretched the limb. In doing this the practitioner twisted coolly, while the patient bawled lustily; then suddenly

the stick was withdrawn, allowing the cord to untwist itself, and the ankle was found to be perfectly reinstated.

“Within a short distance of Wahakotta lived a celebrated Kandian oculist, whom I afterwards employed to cure a pony of a disease which in Ceylon is common to cattle and horses, but never attacks human beings: it is a worm that is somehow received into the aqueous humour of the eye; this it first distends, then dims its colour, and eventually destroys vision. The applications which this practitioner used were, I believe, all preparations or portions of vegetables, and seemed to give great pain to the horse; but the cure was complete, the insect was destroyed, and the eye eventually recovered its transparency. The native medical practitioners are certainly acquainted with medicines of very powerful effect in relieving complaints of the eye; although in these, as in most other diseases, they often do mischief from their ignorance of anatomy. They are particularly successful in their management of boils and tumours (common afflictions of the Ceylon climate); and, amongst many different forms of treatment, occasionally make most daring and extensive use of the actual cautery. The usual mode of payment to a medical practitioner amongst Kandians ensures his utmost exertions to accomplish the cure of his patient, as on that depends his own remuneration. Not trusting to the gratitude or generosity of the invalid, the fee, in money or some article, such as a cloth, brass dish, or article of jewellery, is deposited before the case is undertaken; if unsuccessful, the pledge is restored: a desperate case they will not undertake, unless paid in advance. In their medical books, along with much absurdity, it is probable that some information and many valuable medicines might be discovered by any one competent to examine their directions, and analyse the number of things which they enjoin to be compounded in the most trifling prescription: perhaps the number of ingredients is only to conceal the simplicity of the only useful component part.

“Sirisangabo succeeded him in A.D. 246, who was a rigid devotee, and had taken the vows of the order *atta sill*; the ordinances of which, together with the observance of many rules of devotion and acts of self-denial, totally prohibited the destruction of animal life. It may readily be conceived that the feebleness of a government administered by so bigoted an enthusiast soon led to anarchy. Crimes of the greatest enormity, committed with impunity, rapidly increased in all parts of the kingdom. When the malefactors were brought to the prison of the capital, as the king's vow precluded the possibility of their being executed, they were secretly released at night after condemnation; and the corpses furnished by the usual casualties of a populous city were exhibited at the place of execution, on gibbets and impaling poles, as the victims of the violated laws. ‘By these means,’ says the Buddhist historian, ‘a pious king successfully repressed crime, and yet gave the criminal time and opportunity to reform.’ The result, however, as might have been expected, was precisely the reverse of that representation. The whole frame of society was disorganised; and a famine, with its usual concomitant, a pestilence, combining with these public disorders, Golooabhaa, who then held the office of treasurer, easily wrested the sceptre from the weak hands which then avayed it. Sirisangabo offered no resistance. ‘He privately left the city, taking with him,’ observes the historian, ‘nothing but

his ‘preankada’ (water-strainer), which is used by all the devotees, from the *pan sill* to the *atta sill* orders, to prevent the destruction of the lives of the animalculæ which they would otherwise imperceptibly swallow in drinking unstrained water.’ The ‘Maha Wanse’ briefly closes the history of this king by stating that, in his wanderings as a hermit, he met with a peasant who shared his scanty repast with him. Wishing to reward this act of charity, and having nothing else to bestow, Sirisangabo, by the supernatural power he had acquired by his life of piety, ‘detached’ his head from his shoulders, and presented it to the peasant, desiring him to produce it to Golooabhaa; which he did, and received his reward.”

## MISCELLANEOUS.

*Jack Ashore.* By the Author of “Rattlin the Reefer.” 3 vols. 12mo. London, 1840. Colburn.

THE story of a Jack Tar, who, born and bred to the sea, is very far from being at home on land, though he has succeeded to a large fortune and a baronetcy. Prosperity upsets him, and the sharks ashore abuse him in every way, till he is driven mad by intemperance, a faithless wife with a rascally lawyer father, fashionable friends, and other villanies. He is, however, ultimately restored to reason, justice is done on the criminal, and he enjoys all earthly felicity with his first honest passion—a paragon of a sailor's lass.

*The Year-Book of Facts in Science and Art.* &c. &c. By the Editor of the “Arcana of Science.” 12mo. pp. 286. London, 1840. Tilt.

WITH a print of the Thames Tunnel in its present state, 1075 feet completed, and sixty feet yet to perforate, and a vignette of the *gymnotus*, and a number of woodcuts, this little volume contains a multitude of pretty pickings, shewing the progress of arts and sciences during the past year. We observe, with pleasure, that the *Literary Gazette* has contributed its full share of this useful and interesting *mélange* of information.

*Dr. Turton's Manual of Land and Fresh-Water Shells of the British Islands.* Pp. 324. London, 1840. Longman and Co.

WE cannot pass a new and much-improved edition of this beautiful work by Mr. J. E. Gray without expressing our great satisfaction at the manner in which he has performed his task. The plates are admirably coloured after nature.

*The Life and Letters of M. Tullius Cicero.* In 1 vol. 8vo. pp. 829, double columns. London, 1840. Moxon.

THE whole *corpus* of Tully, his life by Middleton, the letters to several of his friends by Melmoth, and the letters to Atticus by Dr. Heberden, are here collected into a single volume; and thus a very acceptable service performed to the lovers of literature. What a fund of genius, what eloquence, what feeling, is contained in these eight hundred pages!—The book is a library.

*Map of the World on a Globular Projection.* Constructed for the Use of the National Schools of Ireland. By S. Arrowsmith. London, 1836. Smith and Son.

THOUGH this map (one of the series engraved for the Irish National School Commissioners) has been published nearly four years, it has been used almost exclusively in Ireland, and its sale would in all probability have been confined to that part of the empire; but, on the death of Mr. Arrowsmith, the plates were purchased of that gentleman's executors by the

\* “Moon Street.” † “Great King Street.”  
‡ “Great Sandy Street, or from the river Mahawelli-ganga.”

original publisher, who has now reissued the maps in sheets and on rollers. The series consists of maps of Europe, Asia, Africa, America, England, Scotland, Ireland, Ancient and Scripture World, and Palestine. They are engraved on a very large scale, are adapted for schools and lecturers, and very low in price.

*Disquisitions on the Theology and Metaphysics of Scripture, &c.* By Andrew Carmichael, M.R.I.A. 2 vols. 8vo. London, 1840. Mardon.

AFTER a somewhat mystical dedication (not intelligible, at least, to the general public), our author goes laboriously into an examination of the momentous questions involved in his inquiry. The result is striking, for he maintains that man has no separate soul, but that his life to come will depend entirely on the resurrection of the body; which is, in fact, body and soul conjoined!!!!

*Geometrical Propositions Demonstrated; or, a Supplement to Euclid, &c.*, by W. D. Cooley, A.B. Pp. 94. (London, Whittaker and Co.)—Mr. Cooley's edition of 'Euclid's Elements' obtained great praise, and the present Key to the Exercises which he appended to that publication are not likely to diminish his reputation for clearness and precision in mathematical demonstrations.

*The English in China*, by W. Curling Young, Pp. 147. (London, Smith, Elder, and Co.)—Mr. Young condemns our past conduct and policy in regard to China, and deprecates a war as unjust and cruel. He holds that the merchants have an irresistible claim upon the government for the opium given up to Superintendent Elliot. His notes on previous history, &c., are interesting at this time, and have the merit of brevity.

*Practical Observations on Distortions of the Spine, Chest, and Limbs, &c.*, by W. J. Ward, F.L.S. &c. 8vo. pp. 202. (London, Renshaw; Bath, Meyer.)—A new edition of a work founded on considerable experience at Bath, both on distortions and on chronic diseases induced by them.

*People's Edition: Travels in the Burman Empire*, by Howard Malcolm, Pp. 82. (Edinburgh, Chambers; London, Orr and Co.)—In double columns, we have here a very cheap reprint of Malcolm's *Travels in Burmah*. The seal and useful intelligence of the American missionary must be very welcome in so popular a form.

#### ARTS AND SCIENCES. GEOLOGICAL SOCIETY.

FEBRUARY 26th. Mr. Greenough, Vice-President, in the chair.—Three communications were read:—1. 'Further Observations on the Fossil Trees found on the Manchester and Bolton Railway,' by John Hawkshaw, Esq. Since the reading of Mr. Hawkshaw's former communication, on the five fossil trees discovered in an upright position in making the line of the Manchester and Bolton Railway (see *Lit. Gaz.* No. 1173), a sixth tree has been found similarly situated, and at a short distance from the others; and the author, therefore, commences this paper by expressing additional confidence in the belief, that the trees grew on the surface of the stratum on which they now stand. Mr. Hawkshaw then proceeds to the principal objects of his supplementary communication; the rapid decay in tropical regions of the interior of felled or prostrated dicotyledonous trees, and the probability that many of the casts of large stems found in the coal measures are due to the filling up of the decayed centre of trees of that class, and are not, as many geologists believe, casts of monocotyledons. The tropical forests with which Mr. Hawkshaw is acquainted from personal examination, are situated in Venezuela, on the shore of the Caribbean Sea, between the eighth and tenth degrees of north latitude, and sixty-fifth and seventieth of west longitude. In that district a few months are sufficient for the destruction of the interior of the largest dicotyledonous tree, particularly in the low and flat forests along the coast; but similar effects, Mr. Hawkshaw says, are less frequently produced in monocotyledonous vegetables, and he does not recollect a single instance of a palm

which had been thus rendered hollow. In some cases noticed by the author, the excavated portion of the dicotyledonous tree remaining in the ground resembled the founder's mould, when the pattern has been withdrawn and the metal not been run in. Occasionally prostrated trees, bearing all the outward appearance of being solid, yielded to the pressure of his foot, and proved to be only hollow tubes; and dangerous accidents have occurred from temporary bridges having been constructed of dicotyledonous trees, the decay of which was rendered evident only by the passenger being precipitated into the stream beneath. The low and flat districts, in which the destruction proceeds most rapidly, and in which, from the deep rich soil, as well as excessive moisture, the spaces between the forest trees and larger palms are crowded by canes, bamboos, and other plants, are the tracts which, Mr. Hawkshaw says, would be most easily submerged; and, he adds, if the filling-up or undergrowth were sufficiently great, a seam of coal might be hereafter formed, containing few traces of solid dicotyledonous trees, but casts of excavated trunks: and, in conclusion, he therefore infers, that, though in our coal-fields fossil plants are found filled with a mechanical deposit, and containing traces of other vegetables, yet that this condition does not prove the original plants to have been hollow, as they may have been solid trees excavated by operations similar to those now in progress in tropical forests.—2. 'Observations on the Characters of the Fossil Trees lately discovered near Manchester, and on the Formation of Coal by Gradual Subsidence,' by J. E. Bowman, Esq. The author contends that the theory of the subsidence of the land on which the vegetation grew will account more satisfactorily for many of the phenomena of our coal-fields than the supposition of the plants having been drifted from a distance, and deposited under water; and that it is impossible for a seam of coking coal to have been formed, unless the vegetables were covered during the process of bituminisation by a sufficient body of clay or sand to have prevented the escape of the volatile ingredients. Mr. Bowman next notices the discovery, in 1838, in making the tunnel at Claycross, near Chesterfield, of a number of trees, presumed to be equal to forty, standing at right angles to the plane of the strata; and afterwards proceeds to shew, with reference to fossil trees generally, but more particularly to those on the Manchester and Bolton Railway, 1. That they were solid, hard-wooded, or timber trees, in opposition to the common opinion that they were soft or hollow; 2. That they grew and died on the spots where they have been found; and, 3. That they became hollow by the natural decay of their interior. In support of the first point, he adduced several strong arguments; and, in reference to the second, that the trees grew on the spots where they are found, he repeats his belief that the seams of coal were formed out of the debris of a luxuriant vegetation gradually submerged; and he alludes to the difficulty advanced by other writers, of supposing that a number of trees could be drifted in a vertical posture, and placed side by side, perpendicularly to the plane of the bed on which they stand: he also urges the downward direction of the roots as a proof that the trees are in their original position, for if they had been drifted and deposited loosely, the weight of the stems would have bent the roots upwards. With reference to the third point, that the fossils became hol-

low from the decay of their wood, Mr. Bowman alludes to Mr. Hawkshaw's observations communicated to the Society in the foregoing memoir, and made known to himself on previous occasions; he also quotes the authority of Mr. Schomburgk for similar examples of the rapid destruction of the interior of dicotyledonous trees in the low and hot districts of Surinam. He then details, with some minuteness, the process by which he considers that the vertical stems may have been hollowed and filled with the sediment contained in the water, under which, he conceives, the previous dry land was at that period submerged. In conclusion, Mr. Bowman offers some remarks founded on the growth of trees in tropical climates, respecting the period which it would require to accumulate a mass of vegetable matter sufficient to produce a bed of coal nine inches thick. He is of opinion that the minimum of time would be a century; and that to produce a seam of coal nine inches thick, twenty-seven inches of vegetable matter would be required.—3. 'On the Character of the Beds of Clay lying immediately below the Coal Seams of South Wales, and on the Occurrence of Coal Boulders in the Pennant Grit of that District,' by W. E. Logan, Esq. In South Wales, immediately beneath every seam of coal (and nearly 100 have been ascertained to exist), there occurs a bed of tough, sometimes black, clay mixed with sand, and locally known by the terms underclay, under-cliff, understone, poncinn or bottom stone. This bed is of the utmost value to the collier in the prosecution of his labours, for its continuance may enable him to recover a seam of coal which had gradually thinned out in a former portion of the works. It is only when the underclay fails that he feels assured the direction of his search must be changed. It is not, however, by its mineralogical characters alone that this bed is best known. The grand distinguishing feature is its being crossed and penetrated in every direction by the stems and fibres of the *Stigmarias fœoides*; and it is on the underclay alone that the stem and fibres are connected. The stem is found in other beds, but without the fibres. Mr. Logan then quotes Mr. Steinbauer's description of this fossil, and that author's opinion that it grew where it is found. In this opinion he coincides; and he says it is impossible to avoid the inference, that there is some essential and necessary connexion between the production of the underclay with its plants, and the existence of the coal. To account for this unfailing combination by drift appears to him an unsatisfactory hypothesis; but whatever may be the mutual dependence of the phenomena, Mr. Logan believes that they give us reasonable grounds to suppose we have in the *stigmarias* the plant to which we are chiefly indebted for the vast stores of fossil fuel. In the second part of the paper, Mr. Logan details the circumstances connected with the interesting fact of the occurrence of boulders of coal in that portion of the measures called the pennant grit. Between the top of a seam of coal and a bed of hard sandstone at Penclawdd, on the Bary River, he obtained, last spring, a small attritured boulder of cannel coal; and attention being thus directed to the subject, it was found that in the enormous deposit of sandstone forming Cilfay Hill and the Town Hill, ranging from Swansea to the Bary River, there occur many irregular beds, containing innumerable pebbles and small boulders of coal, also pebbles of ironstone and boulders of granite and mica slate. Many impressions of

low from the decay of their wood, Mr. Bowman alludes to Mr. Hawkshaw's observations communicated to the Society in the foregoing memoir, and made known to himself on previous occasions; he also quotes the authority of Mr. Schomburgk for similar examples of the rapid destruction of the interior of dicotyledonous trees in the low and hot districts of Surinam. He then details, with some minuteness, the process by which he considers that the vertical stems may have been hollowed and filled with the sediment contained in the water, under which, he conceives, the previous dry land was at that period submerged. In conclusion, Mr. Bowman offers some remarks founded on the growth of trees in tropical climates, respecting the period which it would require to accumulate a mass of vegetable matter sufficient to produce a bed of coal nine inches thick. He is of opinion that the minimum of time would be a century; and that to produce a seam of coal nine inches thick, twenty-seven inches of vegetable matter would be required.—3. 'On the Character of the Beds of Clay lying immediately below the Coal Seams of South Wales, and on the Occurrence of Coal Boulders in the Pennant Grit of that District,' by W. E. Logan, Esq. In South Wales, immediately beneath every seam of coal (and nearly 100 have been ascertained to exist), there occurs a bed of tough, sometimes black, clay mixed with sand, and locally known by the terms underclay, under-cliff, understone, poncinn or bottom stone. This bed is of the utmost value to the collier in the prosecution of his labours, for its continuance may enable him to recover a seam of coal which had gradually thinned out in a former portion of the works. It is only when the underclay fails that he feels assured the direction of his search must be changed. It is not, however, by its mineralogical characters alone that this bed is best known. The grand distinguishing feature is its being crossed and penetrated in every direction by the stems and fibres of the *Stigmarias fœoides*; and it is on the underclay alone that the stem and fibres are connected. The stem is found in other beds, but without the fibres. Mr. Logan then quotes Mr. Steinbauer's description of this fossil, and that author's opinion that it grew where it is found. In this opinion he coincides; and he says it is impossible to avoid the inference, that there is some essential and necessary connexion between the production of the underclay with its plants, and the existence of the coal. To account for this unfailing combination by drift appears to him an unsatisfactory hypothesis; but whatever may be the mutual dependence of the phenomena, Mr. Logan believes that they give us reasonable grounds to suppose we have in the *stigmarias* the plant to which we are chiefly indebted for the vast stores of fossil fuel. In the second part of the paper, Mr. Logan details the circumstances connected with the interesting fact of the occurrence of boulders of coal in that portion of the measures called the pennant grit. Between the top of a seam of coal and a bed of hard sandstone at Penclawdd, on the Bary River, he obtained, last spring, a small attritured boulder of cannel coal; and attention being thus directed to the subject, it was found that in the enormous deposit of sandstone forming Cilfay Hill and the Town Hill, ranging from Swansea to the Bary River, there occur many irregular beds, containing innumerable pebbles and small boulders of coal, also pebbles of ironstone and boulders of granite and mica slate. Many impressions of

*Sigillaria*, and other plants, coated with coal, likewise occur in the mass; and Mr. Logan has ascertained the difference of the age of this coal from that of the boulders, by having observed that, wherever the plants and the boulders are in contact, the cleavage of the coal investing the plant presents an uniform parallelism, while the cleavage of the pebbles is parallel to their sides, which are inclined in all possible directions. The coal of these boulders, like that of the regular seams of the neighbourhood, is of the common bituminous kind, but Mr. Logan found two small pebbles consisting of cannel coal; and the only seams of that nature which could have yielded them lie about 2000 feet below the conglomerate of which they formed a portion.

March 11th. Dr. Buckland, President, in the chair.—Two communications were read. 1. 'On the Rocks which form the West Shore of the Bay of Loch Ryan, in Wigtonshire,' by J. C. Moore, Esq. The district described in this paper had been previously considered to consist of a part of the great greywacke series, which extends from the Irish Sea to St. Abb's Head; and is coloured as such in the maps of Mr. Necker, Dr. Macculloch, and Mr. Phillips. The greater part of the district, Mr. Moore says, undoubtedly belongs to that class of formations; but he ascertained, during the summer of 1839, that in the portion bordering upon the loch, and extending about eleven miles from north to south, and five from east to west, there exists, 1. Greywacke; 2. Trap rocks; 3. Sandstones and shales of the coal formation; and, 4. A red breccia, which reposes upon them. 1. The greywacke constitutes the greater part of the district, and the beds are generally almost vertical, with a prevailing strike towards east by north. At the northern extremity, near Corswell lighthouse, beds of conglomerate occur; and in a little bay called Sloughnagarry are strata of a slaty character, abounding in impressions of fossils, determined by Mr. Lyell to be graptolites. 2. The trap-rocks form two dykes, one near the northern extremity of the peninsula, and the other extends from near Loch Connell for about two miles westward; and they are situated wholly in the greywacke. 3. The sandstones and shales of the coal measures are similar to those of the coal-field of Ayr, and fruitless attempts have in consequence been made to find coal. The beds generally dip at a moderate angle to the east or south-east. In one quarry, *Stigmaria ficioides*, and in another, *Calamites*, have been found abundantly. 4. The red breccia forms a band bordering upon the loch, and extending about eight miles from north to south. It consists entirely of angular fragments of greywacke, cemented by red clayey sand. The beds incline very slightly to the south-east. As Mr. Moore did not detect any organic remains in this breccia, or find it covered by any other rock, he has been unable to fix more accurately the period of its formation.—2. 'On the Silicious Bodies of the Chalk, Green Sand, and Oolites,' by Mr. Bowerbank. The singular forms presented by tuberosus chalk-flints have long induced naturalists to believe that they were of organic origin; but Mr. Bowerbank states that he was first led to examine their structure microscopically, in consequence of Professor Ehrenberg's observations on silicious bodies. In all the flints which he has examined, from numerous localities, he has invariably found an appearance similar to that of decomposed vegetable or animal matter, spicula, *xanthidia*, *foraminifera*, and frequently fragments of brown reticulated tissue. Very full

descriptions are given in the paper of the appearances exhibited under a sufficient magnifying power, but it is not possible to render them intelligible without the aid of illustrations. We can, therefore, only give the conclusions at which Mr. Bowerbank has arrived. That the flint was not deposited in an empty cavity, formed by the removal of the body whose shape it presents, Mr. Bowerbank proves, not only by the structure alluded to above, but also in cases where it is not to be detected, by spicula and *foraminifera* being dispersed through the whole substance of the flint, as in recent sponges; whereas, if they had been derived from the decay of a previously existing body, they would be found only in one part of the flint, or that which occupied the lowest position. If the chalk be washed from a flint, and the surface then examined by a power of about fifty linear, it will be found to present a saccharine appearance, with occasionally deep circular cavities, and fragments of shells and other extraneous bodies imbedded in, or slightly adhering to it. If the surface be still further cleansed from the chalk by diluted muriatic acid until effervescence ceases, spicula will appear projecting from the sides of the deep circular orifices; if, again, small fragments about a quarter of an inch in diameter, and presenting the roughest aspect, be selected, and examined with a power of 120 linear, illuminated by a Leiberkuhn, the surface will be found to be a complex mass of small contorted tubuli, the apices of many of which, as in specimens examined by Mr. Bowerbank, will be found to be furnished with a minute perforation. The structure and other characters of the horizontal and vertical layers of tubular flints are stated to accord perfectly with those of nodular flints, except that the under surface of the former has a still more strongly marked spongy aspect. Mr. Bowerbank then refers to the habit of recent sponges to coat shells and other marine bodies, and by applying it to the organic remains of the chalk he shews why these fossils are so frequently invested in part with flint, having a tuberosus form, or which have taken the shape of the sponge that grew upon the dead shell, or other body. The flints which sometimes fill *echinodermata*, either wholly or partially, Mr. Bowerbank is of opinion are due to sponges having grown within these bodies; and in support of his view he states, that the surface of the flint within partially filled echinites is irregular, which would not be the case if the silicious matter had not been deposited upon a surface. The projecting of the flint through the orifices of the echini, and its extension to a great or less distance, he also explains, on the supposition of the sponge having grown outwards through those openings. The surface of these flints, whether within or without the fossil, is stated to present the same characters as those before mentioned; and other indications are noticed of *porifera* having lived within the echinite. Mr. Bowerbank next proceeds to shew, that the flints which invest zoophytic nuclei, and are found so abundantly in Wiltshire, exhibit the same structure, and that their interior surface presents spicula from every part, though none have been observed by him on the enclosed zoophyte; and an argument in favour of the nucleus having been invested by a sponge is drawn from portions of the nucleus frequently appearing on the surface of the flint. Extending his inquiries still further, Mr. Bowerbank examined the cherts of the green sand, and he arrived at similar conclusions respecting their origin; the differences in the character of these bodies

consisting principally in the coarser texture of the spongy fibre, the larger dimensions of the interstices of the network, and the greater size of the enclosed organic bodies. Two chert-casts of *Spatangi* from Shaftesbury presented analogous appearances to those exhibited by chalk fossils of the same nature. Specimens of chert from the oolite of Tisbury and Portland afforded similar strongly-marked evidences of organised origin; but a greater quantity of the cellular structure was preserved than in the flints and chert of the chalk or green sand, and the character approached more nearly to that of the fresh-water sponge, except in the spicula being fewer. With respect to the cause of the deposition of the flint, Mr. Bowerbank objects to the supposition that it was influenced by the siliceous spicula, because the microscope proves that the accumulation of the silex has been in no case limited or determined by their immediate presence; nor have they acted as nuclei from which the silex has radiated in the form of needles or crystals, forcing the surrounding bodies before them in the manner frequently observed in silicified wood. On the contrary, he is induced to think that the animal matter was the attractive principle, and that this supposition will readily account for all parts of the sponge, with the extraneous matters, having been retained in the position which they occupied during its life. In support of this opinion Mr. Bowerbank mentions the silicious shells of Blackdown, which contain no spicula; also the silicified corals of the Tisbury oolite and the mountain-limestone, in which cases it cannot be supposed that silicious matter was the attractive agent. Lastly, he mentions the pyritous fossils of the London and other clay formations, as proofs of the attractive influence of animal and vegetable on mineral matter; the pyrites occurring in those formations in greatest abundance in the immediate proximity of the organic remains.

#### ROYAL GEOGRAPHICAL SOCIETY.

In our last we briefly adverted to Messrs. Isenberg and Krapf's travels in Eastern Africa. Zeilah, whence they started, is a decayed town, containing only eight stone houses, and about 100 straw huts, together occupied by about 800 inhabitants, mean and poor. It may, however, shortly become an important place, from affording the readiest means of penetrating into a most interesting portion of Africa. The harbour is bad, having many sand-banks, and several small islands, near it towards the north. The men of Zeilah dye their hair red: the women go unveiled, and wrap a piece of blue cloth round their heads. The native inhabitants are quite different from the Abyssinians and Arabs, and seem allied in language and features to the population of Shoa, and some of the Galla tribes. Zeilah is surrounded with walls, and has on the land side seven pieces of ordnance, pointed to the country of the Somalis.

April 3. Quitting Zeilah in a small vessel, with a N.E. wind, they arrived the following day at Tajurah. This town is still smaller, poorer, and less populous, than Zeilah, and contains only about 300 people. It is, however, the nearest road to get into the southern parts of Abyssinia. Much game and sea-fowl are found near Sukla, to the north of Sagalle, and also leopards in the mountains. The traveller takes a course S.W. and reaches a table-land called Wardeliam, considerably elevated above the sea. Thence, to an encampment named Muja, situated to the north of the Salt Lake,

called Assal. Near Muja, the ground is full of chasms and gulfs, the remains of volcanoes. Mountains bound the lake on the S.E. and S. Passing Guagnal, they came to the valley of Kallu, where there was plenty of water and vegetation. Here the traveller is in the country of the Arab tribe, called Madaites, the most powerful in these parts. Their chief residence, or capital, is called Aussa, where several Ulemas and learned Mahomedans reside. This tribe spreads itself northward as far as Massowah. Aussa lies about twenty miles due west from Karanta. The mountains south of Karanta are volcanic. In the vales are found grass, and brushwood, and also ashes. Arabdera is a vast elevated plain covered with volcanic stones. Mari is a high eminence, the air on which is so pure and fresh, that Mr. Isenberg felt rather refreshed than fatigued from the journey. Lukki, with an extensive prospect and mountains in the distance, and Kumi and Gannessa are noted; near which they saw to their left, and at a short distance, Mount Afraba, peopled by Issa Gallas; while to the right they saw distinctly the high land of Shoa and Effat. At Little Mulloo they found the grass in the level ground so high, that it rose above the head of a man on horseback, which indicates a good soil. As they approached the Hawash, they crossed a considerable ridge of hills, which skirt the eastern side of the valley of the Hawash, and, descending this ridge, they came to Douille. Proceeding thence over the fine plain covered with trees, they came to the river Hawash, which they crossed on the 20th of May, at the close of the dry season. They found the stream twenty yards broad, from two to four feet deep; and the banks from fifteen to twenty feet high. Its course thence through the plain, which is of considerable breadth, is first north, and then north-east, to Aussa, near which it spreads itself into a large lake, and is probably carried off by evaporation. The size of the Hawash at the point where the travellers crossed the stream, shews that its sources cannot be far distant to the S.S.W., while the lake wherein it terminates may be placed at the distance of seventy miles W.S.W. of Tajurah. The right bank of the Hawash, below the point where Mr. Isenberg crossed it, is inhabited by the Madaites tribe, and the left bank by the Orgubbassian tribe; higher up, the right bank of the river is inhabited by the Danakili Warma; south of them and of the route, the Abarras dwell; and still further south, the Alla Gallas. The village or town of Mulukujji is situated on the left bank of the river, near which is a small lake, wherein there were many crocodiles and hippopotami. This region is very prolific for a naturalist. Beyond this there is another lake, the waters of which are of a disagreeable taste, and have a sulphureous smell, but which are of a remarkably cleansing quality, and are therefore much used for washing clothes. West of this, and a little to the east of Assabobe, is another and still larger lake, called La Adu, or *far distant water*, in which there are many hippopotami. The district is called Dofar, and has numerous forests abounding with game, and a great variety of birds, which by their warblings rendered the roads lively. Beyond Akonti they crossed the fine valley of Kokai, abounding with lofty trees, excellent water, abundance of cattle, and a great variety of birds; and next, crossing several hills, the prominences of the high lands of Abyssinia, which extend from the north far southward, they reached Dinomali, the frontier station of Shoa, where revenue officers are stationed, and immediately adjoining

ing which is the village of Fari, where the travellers rested. From Fari, Mr. Isenberg and his companions advanced on their way to Ankobar, the capital of Shoa. Soon after, they reached a village named Aliu Amba, situated on the top of a steep rock, where they met the first Christian governor whom they had seen in that distant portion of Africa. From the village mentioned, they proceeded forward to Ankobar, which is built on the summit of a high conical hill, from whence they had an extensive prospect. The king's house stands in the upper or the highest part of the town, and is built of stone and mortar, with a thatched roof. The other houses are chiefly built of wood, with thatched roofs, generally surrounded with a garden, and disposed around the cone in a spiral form. "The situation, the rich vegetation in a cool vernal, or almost autumnal atmosphere," says Mr. Isenberg, "almost put us in an ecstasy." The king, being at Anpollalla, about twenty miles further south-west, they proceeded forwards to meet him, passing through only a part of Ankobar. They marched on stony roads, and on the side of some mountains. Crossing an elevated valley, through which flowed a crystal rivulet, which was to set a mill in motion, then erecting by a Greek mechanic named Demetrius, "they breathed," says Mr. Isenberg, "alpine air, and drank alpine water." They next ascended another high mountain, abounding with camomile, pennyroyal, and numerous alpine plants. The top of the mountain was covered with barley fields, then (June 8th) almost ready for the harvest. The thermometer, during the night, could not have exceeded 40°, which, in that parallel of latitude, and in the middle of the northern summer, gives a great elevation. They slept at a small village called Metakui, and next day proceeded westward over an undulating table-land, when, after a few hours' journey, they reached the village of Islam Amba, where they met the king of Shoa, who received and welcomed them with the greatest respect and cordiality. He made particular inquiries of them about their journey and their object, and was especially inquisitive regarding geographical information. The journal of Mr. Krapf, who remains at Ankobar, brings down the narrative of events as late as the 2d October, and contains much additional information. This paper was illustrated by a sketch-map of the route, drawn by Mr. Macqueen, who also pointed out the peculiar value of the information contained in the journal of Messrs. Isenberg and Krapf, and its bearing on the great question of the civilisation of Africa.—3. "Journey from Esmeralda, on the Orinoco, to San Carlos and Moura, on the Rio Negro in Brazil, and thence by Fort San Joaquim to Demerara, between March and June 1839. By Mr. Schomburgk. "Quitting Esmeralda on the 25th February, and continuing the descent of the Orinoco to the W.N.W. for thirteen miles," says Mr. Schomburgk, "we arrived at the remarkable bifurcation of this river, so well and so fully described by Baron Humboldt. Entering the southern branch or natural canal of the Cassiquiare, here about 100 yards wide, and current seven-tenths of a mile an hour, we found it shallow, and studded with rocks of granite; its banks are high, and covered with dense but not lofty vegetation; among others I remarked the Sirabally, a species of laurus, and the Sawarai palm. As we descended I observed on some granite blocks several circles and lines, some of the Indian picture-writing, and the first I had seen since quitting the Essequibo. Some distance lower

down we landed at Mandavaca, the first inhabited place in descending the Cassiquiare. Here is a population of about eighty Creoles and Indians, whose chief occupation is making rope of the chiquechique palm (*Attalea funifera*), which at the time of the high waters are carried to Angostara on the Orinoco, a distance of 600 miles, for sale. At five miles below Buenavista, a remarkable transported block of bare granite, named the Piedra de Culimacari, rises 150 feet above the stream, at its base is an impenetrable thicket of bamboos, palms, lianas, &c.: a little to the right there are other masses of granite, one forty feet high, resembling an obelisk in form, which supports another rock on its top; against this reclines another boulder: the whole forming a picturesque and curious group. The length of the Cassiquiare, including its windings, is 176 miles; its breadth at its mouth is 550 yards; that of the Guainia, coming from the north-west, into which it flows, is 600 yards: the united streams hold their course to the south-east under the name of the Rio Negro, or Black River, from the colour of its waters. San Carlos, a village at the confluence, contains about 400 persons.

"March 7th. Early in the morning we passed the granite hill of Cocui, which rises 850 feet above the plain. Near the village of Mabé we saw a large-decked canoe waiting the rise of the water to enable her to navigate the stream, which, although so shallow, was here 900 yards wide; it is only at that period that the products of the forests, as zarzas, pucherí, jalap, balsam copaiva, &c., can be carried to Para, a voyage of two months with the stream, but of six months against it. Just below the river Isanna joins from the west; its upper parts are thickly inhabited by Indian tribes, against whom an expedition had recently been sent under pretence of pressing them for the Brazilian navy, but in fact to send them to the mines in the interior as slaves; and such was the terror caused by it, that we found many of the villages deserted or inhabited only by women and children. The villages on the banks of the Rio Negro are far more neglected than the Spanish settlements on the Cassiquiare and at San Carlos; more than seven years had elapsed since a priest had visited them; and the present pastoral journey of Padre Felipe was the talk of the country. Below Carmo the river expands to three miles in width; its depth varies from ten feet to a few inches; the shores are flat and thickly wooded; palms are numerous, but the height of the forest trees seldom exceeds seventy feet; the majestic mora of the Essequibo is entirely wanting. Bararao, formerly San Thomar, is seated on an eminence on the south bank of the river, here spread out to ten miles in width; here is a church and the ruins of twenty houses; the only inhabitants we found were an old negro woman and an Indian girl; the lianas clambering over the roofs, and the high bushes and grass before the door, gave the idea of utter desolation. With the exception of two species of palm, the foliage, owing to the long continual drought, was very dismal; in whatever direction we turned we saw fire and smoke, and by night had the splendid spectacle of whole islands in a blaze, and numerous other fires in the distance. The pira rucu, or *Sudis gigas*, a fresh-water fish of twelve feet in length, is commonly found here; it is taken with harpoons; its scales are of a beautiful crimson colour, whence its name of *Pira rucu*, or red fish. At Barcellos, a place which at the beginning of this century contained 10,000 in-

habitants, we found twenty houses tenanted; such had been the results of political strife. The Rio Negro is here fifteen miles across, but divided by islands into numerous channels. Passing the mouth of the Rio Branco, we visited the Ilha de Piedra, so called from it containing several blocks of granite, on which there is a large quantity of the so-called Indian picture-writing; they consist of the representations of men, birds, and animals. On one large boulder are thirteen figures of men, arranged in a line as if dancing; the most remarkable, however, are the representations of two vessels, the larger with three masts and like the galleons of those days. There remains, therefore, little doubt that the pictures have been made at a late period, and after the discovery of the Amazons, when the vessels of the Conquistadores already floated on the mightiest stream of the world. It is not improbable that the group of figures may relate to an event of great rejoicing, perhaps the first arrival of Europeans on the Amazons. Ascending the Rio Branco in a general northerly direction, a distance of 300 miles brought us, in twenty days, to our old quarters at Fort San Joaquim. Upwards of seven months had elapsed since our departure from the fort; during which time we had made a circuit of 2200 miles, a tract comprising the sources of the northern tributaries of the Takati, the western of the Mazaruini, the sources of Caroni, the northern tributaries of the Parima, the sources of the Paragua, the Parima Proper, the Merewari, the Orinoco, the Cassiquiare, and the Rio Negro to its confluence with the Rio Branco. After a brief stay here we crossed the short portage that separates the basin of the Amazons from that of the Essequibo; and floating our light canoe on the head waters of a tributary of the Rupununi, we reached its point of junction with the Essequibo, and descending rapidly with a powerful current, we arrived at George Town, Demerara, on the 20th June, 1839, after an absence of more than twenty-two months; in the course of which, besides the route here briefly pointed out, I had traced the Essequibo to its sources. From this rapid sketch some idea may be formed of the vast water communication of this fine country, and which, with a little trouble, might be extended to Santa-Fé de Bogotá, and even to the Pacific on the west, and to Buenos Ayres in the south. Did not British Guayana possess the fertility which is its distinguishing feature, this inland navigation alone would render it of vast importance; but, blest as it is with abundance of fruitfulness, this extensive water communication heightens its value as a British colony, and if emigration sufficient to make its resources available were properly directed thither, the port of Demerara might vie with any in the vast continent of South America."

## PARIS LETTER.

Academy of Sciences, March 31, 1840.

SITTING of March 23.—M. Pelletan disputed the claim of M. Pambour to the invention of a method for increasing the draft, and therefore the power, of steam-engines, by the regulating of the pipe for the escape of the steam, which was mentioned in a recent sitting of the Academy. M. Pelletan reminded the Academy that he had presented a memoir to it, on this very subject, in 1829. M. Poncelet put in a still earlier claim, shewing that he had noticed the fundamental principles of M. Pambour's invention in a work published at Metz, in 1821, although he was not then aware of the extent of its application.

A scientific memoir was read by M. Duvernoy, 'On the Organs of Respiration in Decapodal Crustaceous Animals.' It resulted, that the decapodal brachyuri had a strong resemblance in the form and position of their branchiæ. Many curious details of the form of the branchiæ in animals of this class were adduced; and it was concluded that the capillary system of blood-vessels was wanting in the respiratory organs of crustaceous animals, as Messrs. Ardouin and Milne Edwards had previously shewn.

M. Pelouze read a report on a memoir of M. Lassaigne, entitled 'Inquiries into the Chemical Action exercised by Metallic Salts upon Liquid Albumen and certain Animal Tissues.' This memoir was the result of long inquiries, and formed part of the series of modern observations which were so important, not only to chemistry and toxicology in general, but also to forensic medicine. It was stated that M. Lassaigne's experiments tended to shew that a great number of different salts formed definite combinations with the organic principle, the salt itself remaining in its entire nature. The author, however, entertained some doubts as to the results of various experiments which he had made most carefully, and he honestly expressed them. The latter part of the memoir was more especially dedicated to the notice of the action of salts on albuminous substances.

M. Biot presented to the Academy, in the name of Mr. Talbot, forty photographic images, of which some were photogenic copies of other images on paper, and the rest were images produced by the direct action of the camera obscura. Of the latter, some were admitted to be much better than any that M. Bayard had yet obtained by his peculiar method, especially the representations of certain objects of statuary. Among the images produced by superposition were those of an Hebrew psalm, a Persian gazette, and a Latin charter of 1279. M. Biot remarked on the importance of discovering some substances that would not penetrate deeply into the papyraceous matter; and also dwelt on the comparative advantages of paper in photography over metallic plates. M. Arago presented some metallic images obtained, by M. Daguerre's method, by M. Fizeau. They were of astonishing delicacy and accuracy, and indicated great progress in the manipulation of these difficult experiments. The "Narrateur," of St. Gall, mentions the great progress made by M. Isenring of that place in obtaining photographic images. It states that, by his method, he obtains the outlines and shadows of objects with much greater clearness and precision than they have hitherto attained at Paris: that the colours of the objects are given by it: that he has succeeded with several portraits to such an extent as to require only a few touches by the hand to be made quite perfect. This gentleman is about to apply his method to butterflies and various objects of natural history.

M. Robert has been elected a member in the room of the late M. de Prony.

*Académie des Sciences, Morales, et Politiques.*—Sitting of March 28. M. Miénet, perpetual Secretary of the Academy, informed the members that the king, on the report of the minister of public instruction (M. Cousin), had just issued an ordonnance, commanding the Academy to draw up a complete report on the state and progress of moral and political sciences, from 1789 to 1832 inclusive. The report was to be divided into five heads, corresponding to the sections of the Academy, and was ordered to be presented to the king by the

beginning of January 1842, to be afterwards printed at the Imprimerie Royale. This intelligence was received with warm tokens of approbation by all the members, and addresses of thanks were voted to his majesty and the minister.

M. Jouffroy made some observations on a volume of memoirs just published by the Academy of Besançon, in which, from documents existing in the public library and in the archives of that town, some very important and interesting information had been collected relative to all the departments forming what was anciently Franche Comté. The Council General of the department had voted funds in aid of the publication of this work, and the example was pointed out as worthy of imitation by other departments. M. de Tocqueville read a report on an American work by M. Lieber, entitled "Political Ethics;" he passed a high encomium on it, and observed that it was a complete system of morals applied to politics, in which the peculiar social system of the new world was taken into account, and many valuable doctrines in social matters well developed.

*Académie Française.*—M. Viennet has presented a report on the work by M. de la Farelle of Nîmes, "On Social Progress among the Non-indigent Classes," which he strongly recommended as deserving of the Monthyon prize.

It is asserted, but we know not whether, for the sake of the Academy, we ought to believe the statement, that the minister of public works having charged the Académie des Inscriptions et Belles Lettres with the drawing up of an inscription to be placed on the basement of the new portal of the Abbey Church of St. Denis, the following has been sent to him as the production demanded:—

"Sacrorum assertor, recidivis templa ruinis,  
Hæc instaurari, Napolæo voluit.  
Sed quæ restituit, non conditur ipse sepulchris  
Exilio ante, jacens, quam peragatur opus.  
Successere operi reges: idem exitus illis.  
Et qui perfectæ crepta: Philippus erat.  
AN. M. DCCC. XL."

M. Espercieux, the sculptor, died the other day in Paris, aged eighty-two. His figure of a boy bathing in the gardens of the Palais Royal was produced when he was in his seventy-ninth year.

The Royal Library of Berlin was increased during 1839 by 32,410 volumes: of which 16,321 were printed in Prussia, and remitted in virtue of the law like that of England; 8257 were purchased out of funds belonging to the Library; and 7832 were given or bequeathed to it. Of the books purchased, 5300 were French.

The Polish poet, Mickiewicz, has been appointed Professor of Latin Literature in the Académie de Lausanne.

A shock of earthquake was felt at Messina on the night of the 16th March. Two shocks were felt at Nantes, and in most of the surrounding districts from Angers to Rennes, on the 22d, at 4h. 17m. P.M.

## LITERARY AND LEARNED.

## UNIVERSITY INTELLIGENCE.

OXFORD, March 26.—The following degrees were conferred:—

*Doctor in Civil Law.*—Hon. and Rev. H. Legge, Fellow of All Souls' College, Grand Compounder.

*Bachelor in Civil Law.*—Rev. J. H. Raley, Fellow of New College.

*Masters of Arts.*—Rev. E. P. Smith, Pembroke College; Rev. A. Turner, St. John's College.

*Bachelors of Arts.*—T. F. Maitland, Christ Church; Rev. G. T. Hyatt, Wadham College.

## ROYAL ASIATIC SOCIETY.

MARCH 21. Professor Wilson in the chair.—

The Director, in presenting a copy of two lectures, recently delivered by him at Oxford, 'On the Religious Practices and Opinions of the Hindus,' stated the circumstances under which they had been delivered. He said that the prize of 200*l.* offered by a gentleman in India to the Members of the University of Oxford, for the best essay in refutation of Hinduism, to be conveyed in a manner suitable to Indian modes of feeling, had been accepted by the University in convocation; that the plan laid down by the proposer demanded the acquisition of such preliminary knowledge as could not be acquired without much study, of a kind which was rarely the object of attention in Britain; and that it was the purport of these lectures to give some notice of the nature of the errors which it was sought to overturn, and of the ideas it was the object of the proposer of the prize to controvert. He mentioned, also, that all persons whose names were on the University books at the time of delivering in of the compositions (14 January, 1842) would be eligible to compete for the prize; and this arrangement would enable the graduates of any university in the kingdom to do so by matriculating at any time previous to that date.—A memoir, by the Rev. W. Cureton, 'On the Autograph MS. of the First Volume of Ibn Khallikan's 'Biographical Dictionary,' was read. The writer gives a short account of the work of Ibn Khallikan, which he admits to be great authority upon the matters which come within its design; and to be one which, more than any other, throws light upon Arabic literature; although he is not prepared to bestow upon it the extravagant praise awarded by Sir William Jones. He stated that two editions of this work are now in the course of publication, one at Göttingen, and the other in Paris; and it cannot fail to be interesting that the original autograph copy of the work is in existence, containing all the emendations made by the author himself during a period of more than twenty years, while it remained in his possession. The condition of the MS. is pretty good, although in some parts damaged. The style of writing, texture of the paper, and colour of the ink, denote it to be of the thirteenth century; and the additions between the lines, and on the margins, all in the same hand as the text, which is evidently not that of a professed scribe, are alone conclusive of its being the writing of the author, if the fact was not explicitly stated in the book itself, and by the same hand. At the end is the date, answering to March 1257, A.D. written at Cairo. In the preface, the author states that he began to arrange his materials in alphabetical order, at Cairo, in the previous year. He continued his work until the end of 1273, A.D., and died in 1282. Mr. Cureton is of opinion that the MS. as it originally stood was given to the transcribers to be published; but that one, if not two, subsequent editions, with corrections, were made public before the work received all the corrections in this MS., several of which have never yet been made public. In order to give an idea of the marginal corrections, all those that occur in the first four or five pages are noted by Mr. Cureton. Some of these corrections are found in one of the printed editions, some in both, and some in neither of them. Several of them are of importance in determining names and genealogies of persons celebrated in the literature of Arabia. The writer then sums up the proofs of the authenticity of the MS., and adds that the causes of various readings and differences of length of the chapters in other

manuscripts can be discovered from this autograph volume; that words occurring subsequently to the date of this MS. are always written in the margin, and never in the text, except when new leaves are inserted for the purpose. The declaration of Ibn Khallikan himself, that he is the writer, is confirmed by the attestation of the persons who have at different times been owners of the MS., and by the circumstance of its presentation to a mosque, when there is nothing in the unadorned style of the writing that could have made it worthy of such an honour, unless some circumstance worthy of remark had been connected with the volume. He concludes by expressing his opinion that there is no autograph of any historical work in Europe of whose genuineness there are such clear and positive proofs; and that it may be considered as one of the most interesting curiosities of literature extant.—The Secretary read a few pages of a pamphlet which had been written by Samuel Ball, Esq. many years ago, and printed in China, on the expediency of opening an additional port in China for British commerce. Sir George Staunton stated that this work was intended to suggest to the British embassy of 1817 the objects which it would be advisable to insist upon in case of entering into a negotiation with the Emperor of China. Circumstances, as it was well known, prevented any such negotiation; and the pamphlet had never been made public. It was believed that only two copies of it were in existence; and it was thought interesting at the present juncture to publish it in the Society's "Journal." This would not be against the rules of the Society, as, although printed, the work had never been published.—Mr. E. Solly read a paper 'On the Commerce of Ceylon,' by J. Capper, Esq. The author, after enumerating the principal productions of the island, entered into a statistical history of the three most important ones, viz. cocoa-nut oil, cinnamon, and coffee. The trade in cocoa-nut oil is of very recent date, the first presses having been sent out by government in 1820. Since that year the quantity manufactured and exported has rapidly increased; and Mr. Capper considered that Ceylon could supply Great Britain with that commodity for every purpose for which such fatty substances were required. With regard to cinnamon, he points out the bad policy of the high duty of 300 per cent levied on the export of that article, which holds out a great inducement to smuggling; and which is the more oppressive, as cinnamon, having been introduced into Java, can be exported thence at a mere nominal duty. He also describes the very great disadvantages of the system adopted in the sales of the government plantations, it being the custom frequently to cancel a sale if the prices fetched by the lots were thought too low, when the whole is again put up. The consequence of this is that hardly any one would bid at the second sales. Mr. Capper describes the cultivation of coffee as extending to such a degree, that in a late government gazette there were advertisements of ten lots of land, which had been applied for to cultivate coffee upon, amounting in all to 9500 acres. He concluded with a sketch of the attempts which have been made to cultivate the sugar-cane in Ceylon; from which it would appear probable that this article will shortly be added to the exports of the island. Mr. Solly observed that, at a former meeting he had read to the Society reports from good judges on the quality of the samples of coffee and sugar sent over by Mr. Capper, and that there was every

prospect that the latter, though not then particularly fine, would improve, and become an important export.

#### SOCIETY OF ANTIQUARIES.

Mr. HUDSON GURNEY, V.P. in the chair.—Mr. Repton exhibited drawings of some carvings of the time of Henry the Eighth, remarkable for the arabesque ornaments they contained; they were formerly at Hainakur near Chichester, but now removed to the Earl of De La warr's new mansion at Buckhurst. Mr. Burgess communicated some further observations on the old bridge at Bow: illustrated by a drawing. A portion was read of an account from Mr. C. Roach Smith, of several Roman vases containing bones, beads, armillas, &c., and coins near them, discovered at Strood, Bapchild, Oare, and Upchurch, in Kent; Mr. Smith exhibited three of the vases, with drawings of several others, furnished by the Rev. Mr. Woodruffe of Upchurch, and by C. Charlton, Esq. of Rochester.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Entomological, 8 P.M.; United Service Institution, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Linnean, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8 P.M.; London Institution, 7 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund, 3 P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Friday*.—Astronomical, 8 P.M.; Royal Institution, 8½ P.M.  
*Saturday*.—Westminster Medical, 8 P.M.

#### FINE ARTS.

#### EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS, IN SUFFOLK STREET.

[Concluding notice.]

Among the paintings in the Water-colour Room are some of much merit: as 510. —, C. Run-ciman. 516. *The Love-Token*. J. Tenniel, jun.—This representation of a young and chivalrous knight receiving a scarf from "the lady of his love," has all the spirit of fancy and romance that such subjects require. 529. *Hastings, from St. Leonard's: Mid-day*. J. Tenuant.—Sunlight, heat, and atmosphere, are admirably depicted in this performance. 535. *The Glasscutter*. J. Zeitter.—A subject from the operative class. Its picturesque character and treatment are well calculated "to point a moral or adorn a tale." 543. —, Mrs. M'lan.—A picture of pious resignation; and, like 95, *The Wanderer*, by the same fair artist, highly creditable to her talents. 544. *Llyn Gwynant, North Wales*. W. Fowler.—A picturesque scene of solitude. A quiet silvery tone pervades its colouring, and it is otherwise ably treated. 554. *On Swannington Common, Norfolk*. A. Priest.—Like Rembrandt and other Flemish painters, Mr. Priest has imparted an interest to a scene otherwise devoid of any but to the agriculturist. A lonely horse near the foreground is the only object that breaks the monotony of the view; but the work is nevertheless full of truth and nature.

Water-colour drawings occupy the other side of the room, and from them we proceed to select a few examples. 605. *Scarborough Pier from the Sea*. W. C. Smith.—Though quiet and unobtrusive in its tone and colouring, few subjects of its class are painted with more technical skill, or with more characteristic interest. 666. *At Haddon*. By the same Artist.—A distant prospect, seen through an avenue of trees; warm in colouring, and spirited in

execution. 617. *Interior of a Welsh Cottage. — The Sick Child.* R. Brandard.—Like others of Mr. Brandard's performances, recommended by its qualities as a work of art, as well as by its interest as a subject. 679. *Flowers and Birds.* V. Bartholomew.—Elevated in composition, splendid in colouring, and beautiful in execution; as are all the works of this eminent artist, whose name alone is a guarantee for excellence in productions of this class. 678. *Sketch from a Roman Catholic Priest.* W. C. Smith. 672. *A Study of Flowers.* M. A. Wageman; and 683. *A Bouquet of Geraniums.* Miss Baker,—may serve as an epitome of this department of art, as the works selected from the other rooms may be considered an epitome of the whole collection. If we add 77. *Passatempo in Italia.* A. Egg; 116. *A Shepherd-Boy of the Abruzzi.* R. Buckner; 119. *The Country Girl's Toilet.* H. M'Mannus. A.R.H.A.; and 39. *A Young Lady in the Turkish Dress.* F. Y. Hurlstone; the selection will be more complete. The last-mentioned performance is highly characteristic, and might pass for a beautiful enchantress, with her cup and wand. But why will Mr. Hurlstone, who has so much merit in other respects, persevere, year after year, in ruining his flesh by the sootiness of his shadows? It is really lamentable. Very clever examples in portraiture, by Bird, Holmes, and Latilla, may fairly be left to speak for themselves. To the sculpture Messrs. Bell and Marshall have contributed some fair and tasteful productions; and Mr. Lucas's busts are full of talent.

Thus, as far as our pages can allow, and the opportunities of observation which have been afforded us will admit, we have taken a general view of the Suffolk Street Exhibition; which, in conclusion, we are bound in candour to say, is creditable to the British School.

#### THE FRENCH SCHOOL OF ART.

*The Louvre: Salon of 1840.*

[Second Notice.]

THE spirit of rivalry and petty jealousy that reigns among the members of the Académie des Beaux Arts is, most unfortunately, largely disseminated among French artists of all classes and of all degrees of merit. We would not willingly bring a sweeping accusation against any class of men, and especially the cultivators of art, for whom we entertain esteem and admiration; but we fancy that we have observed, not in France only, but in most parts of Europe, where any thing like a school of art can be said to exist, a wonderful irritability of feeling among the members of that noble profession which has struck us as not less to be lamented than difficult to be accounted for. The least success of a new style, the promulgation of a new method of handling, the adoption of a new form of study, are any of them sufficient to create for an artist enemies among those who ought to be his friends; and while, on the one hand, artists accuse the public, and not always without cause, of judging them hastily or ignorantly, they themselves, on the other, entertain the most uncharitable sentiments towards every one of the profession who happens to be not of their own immediate clique. This is equally true of painters, sculptors, and architects; and it operates very prejudicially on the French artistical world. It is not to be wondered at that, in an age of transition like our own, the antiquated followers of an erroneous and exploded school, such as the Davidian, the Gerardian, &c., should feel hostile to those of later date and of infinitely superior merit—the followers of Ingres, Horace Vernet, &c.; but

that the pupils and imitators of either of these two latter great names should dispute and bicker, not merely against each other as a class, but even among themselves, is very lamentable, and tends to thwart art almost as much as the absence of patronage or the blighting influence of political troubles. To give an instance of this that has come under our personal knowledge, we may mention that one of the most extraordinary painters of marine subjects, Gudin, who is as great in that line, notwithstanding his many defects, as Horace Vernet is in the historical, is run down by the marine painters of Paris with a fierceness of vituperation that is quite surprising. His colleagues see no merit in his compositions; they cry out against the crudity of his colouring, and abuse the rapidity of his execution; nevertheless, he is justly looked up to by three-fourths of the general assembly of French artists as the greatest man in his line, and the voice of the "undiscerning public" is unanimous upon the subject. Again, there is a landscape-painter of great celebrity in Paris, Jules Coignet, who proceeds entirely upon what we may call the opaque system, and who we therefore think is highly erroneous in his practice: still he produces the most magnificent effects; he draws with surprising vigour, his touch is masterly in the extreme, and he is a most careful delineator of nature. The approbation of the public has alighted upon him in golden showers; but he is at the same time a "Paria" among his fellow-artists: there is not a man of them but flings a stone at Coignet; not one will allow him the smallest merit. And yet M. Coignet is the head of a school, and has a very fair "tail" of pupils; and he will live, we venture to prophesy, notwithstanding the mistaken principle on which we think he works. There are fifty instances of the same kind to be adduced; and they lead us to the inference that in such cases the opinion of compatriot artists are not to be trusted, and a man, to have his due meed of justice, must appeal to foreign critics.

However much we may be grieved at the divisions and animosities that prevail in the French School of Art, we cannot avoid being interested at, and often pleased with, the private or domestic manners of the artists taken individually—that is to say, of the leading men. All classes in France are, according to the judgment of northern nations, immoral; and even among themselves, the young painters, as a body, have the reputation of being the worst of the bad. Taking the artistical pupils in this light, the whole herd of "rapins," as they are technically termed, we confess that we know of nothing much worse than their morals, unless they be those of the medical and law students of the University of Paris, for whom we are inclined to reserve a still deeper Miltonic abyss. They are, most of them, young men in indifferent circumstances, with equally indifferent education, thrown upon the great sink of Europe—Paris, left to themselves, and guided only by their own passions: the result may be easily imagined, and the truth is, that they are a disgusting set. It is a fact within our own knowledge, that an English gentleman, a student of the Royal Academy, who entered himself a few months ago at Paul Delaroche's studio (the first in Paris), quitted it on the second day, declaring that, as a man, he could not stop another moment in a place where such abominable behaviour was tolerated. It is a remarkable circumstance, however, that the French artists who have any talent whatever, soon lose all traces of this part of their

professional education; and, whether by mixing with the world at home, or by travel abroad, or by the humanising influence of their pursuit itself, they speedily become quiet and amiable men; the most so, perhaps, of any classes of men in France. Artists of the same clique, and who have any thing like a position in the world, live in Paris all like brothers: they live for their art alone; they are fully imbued with it; they are the poets of form and colour, with the same degree of enthusiasm, the same inspiration and love for their profession, as the most glowing writers or the most enraptured musicians. But they live in very different manners. Horace Vernet and Paul Delaroche, next-door neighbors in the Rue St. Lazare, are married men, fathers of families, and move as princes of art in the first ranks of society. Gudin is a spoiled child of fortune, the personal favourite of the reigning royal family; always at the Tuileries or Neuilly; a dashing man abroad and a luxurious man at home, making his 100,000 francs a-year, and, if report be true, without a sou in his pocket. Isabey, the most good-natured and laughter-loving of mortals, as like an English sailor as any one not a Briton can be, has a charming cottage on the banks of the Lake of Enghien, near Montmorency, with a small yacht on the water; makes excursions along the coasts of France during the summer, and in winter divides his time between his town residence and his atelier. He declares that he practises his art against his will, that he would rather be a musician, a sailor, a shoemaker—any thing but what he is, a first-rate painter, with the comfortable, but not too large, income of 25,000 francs a-year. Decamps, the great master of a peculiar school of painting in France, and perhaps the first in his way in Europe, is a warm enthusiast of the fine arts: he devotes himself, body and soul, to his easel, goes little into society, and has the austere manners of one who knows his works to be destined for immortality. Ary Scheffer also holds himself at a distance from the crowd of mankind: his atelier is a sacred abode of the Muses, into which few are allowed to penetrate, and in which the German mystical poetry of the occupant is not less apparent than the refined delicacy of his sensitive perceptions. Jules Dupré, the founder of a distinct school of landscape, is another artistical ascetic, with features such as Raphael would have chosen for the "beloved apostle," and with a simplicity of mind like that of a child: he broods for days and months over his easel, working out his peculiar theories, and dreaming of the rocky horrors, or the woodland scenery, of Brittany or Devonshire. We might go on with endless sketches of the celebrities of the French school, but our space forbids us; and we have adduced what has just been said as proofs that the more eminent of French artists know how to improve while they enjoy life, and are men who are not only shining lights of art, but are also good citizens and estimable friends. The lower classes of French artists are bad; the upper, all that is good.

Such is the social position at the present day of artists who live on this side of the British Channel, and rejoice in the name of Frenchmen. We know that they are extensively patronised by the state, and much cherished by the community at large; still their remuneration, as is unfortunately the case in many other sublimary callings, is not always in proportion to their merits. And yet they do not much complain: they may wish for more, and no doubt they do; still, on the

whole, great content prevails among them. Décamps, for instance, who is looked up to by all as a master of the highest authority, who is above either envy or detraction, considers it a good year when he makes his 15,000 francs; and for this he paints twelve hours a-day for 364 days out of the 365. His friend Dupré does the same: whereas Master Gudin travels all over the world—goes now to England, now to Constantinople; is at all the balls, dinners, soirées, &c. in the capital; does a little bit of work now and then, and, as we have already stated, would have his pockets, were they not like the Danaid pails, stuffed to repletion with gold and silver. And yet these men are all equal in talent, if indeed Décamps be not the greatest of the three. Dubufe, the most trashy portrait-painter that ever got a name, gains as much as Paul Delaroche, and could buy up all the other limners of men's noses, pots, brushes, and all, though there are dozens among them who could paint against him left-handed. These are *malheurs de guerre*; these are the caprices of that blind goddess whom all men worship though few find propitious.

Before we go into any details of the present Exhibition, it is necessary that we should define clearly the characteristics of the opaque and the transparent schools, between which French artists are now balancing. The latter is founded on the almost uniform practice of the ancient masters, and produces its effect either, 1st, by painting the ground of any part of a picture broadly with some rich transparent colour, upon which opaque-colour is afterwards worked, so as that the ground either appears in many places, or else greatly influences the upper colour (this is the style of colouring adopted by Teniers and Ruysdael, and, as a glorious modern instance, by Landseer; but it is totally unknown, or nearly so, in the French school; or, at all events, is so used as to require some other definition and name): or, 2dly, by painting thick on the ground in opaque glaring colours, and then covering these colours with coats of transparent colour so as to produce the tone desired. (This is in part the practice of Rubens, as well as of many masters of the Italian school, and is partially adopted in the French.) The opaque school, on the contrary, proceeds on the fundamental principle that each colour should be applied so as to produce at once the exact effect that it is intended to retain; that is to say, that a rich brown should be put on at once as a rich brown, in one single colour, and not first of all as a white or yellow tint, glazed down by brownish or reddish tints to the requisite degree of mellowness. It is upon this principle that nine out of ten among modern French artists paint, and it is that makes one of the main differences between that school and the modern school of Great Britain. We hold that, to an impartial judge, there can be no question as to the merits and advantages of the two methods, and that the French are decidedly in the wrong. Their greatest colourists, Décamps, Delaroche, Dupré, Gudin, proceed upon principles more nearly analogous to those of the ancient masters, and, therefore, approach the English school. The transparent method, though not so laborious for the hand, requires more time and more calculation to produce its effect: the opaque method is much more rapid, and is better suited both for the model-room and for out-of-door study; but never produces the same richness, harmony, and unity of tone as the former, and is only fit for the slap-dash daubs of the day. The French artists whom we have just mentioned have adopted a very curious and complicated method

of their own, combining many of the advantages of both styles; but their practice is not uniform, and they differ among themselves so much in their handling, as well as the time required for producing a picture, that it is difficult to say to what their theories may hereafter come. Gudin will paint a large and elaborate picture in a few days; Décamps, in a few weeks; Delaroche would certainly take a year for a canvass of any importance; while Dupré lays it down as one of his fundamental principles, that a picture should always be from two to three years on the easel and in the *atelier*. We shall examine the separate styles of these artists when we come to treat of their pictures; and content ourselves for the present with stating that the richness and solidity of their colouring are their main characteristics. There is another great colourist among the younger artists, Eugène Delacroix; but he is of the comet species—eccentric, parabolic, and not yet fully understood.

## NEW PUBLICATIONS.

*Captain James Clark Ross, R.N. &c. &c.*  
Engraved by Henry Cook, from an Original  
Painting by Wildman. Colnaghi and Puckle.

A CLEVER line engraving. The features appear to us to be rather too strongly marked.

*Mademoiselle Taglioni.* Painted by Mrs. Soyer; Drawn on Stone by R. I. Lane, A.R.A. Mitchell.

WE wish it were in our power honestly to praise this little print; but, alas! Taglioni is all lightness and grace, whereas —

## BIOGRAPHY.

THOMAS DANIELL, ESQ. R.A. F.R.S. A.S.  
AND R.A.S.

THIS veteran in art died at his residence, Earl's Terrace, Kensington, on the 19th ult., at the advanced age of ninety-one. Like several other distinguished members of his profession (some of whom are living), in youth he served his time to a herald painter. When his apprenticeship expired he became a student of the Royal Academy, but principally devoted himself to painting landscape. At the age of thirty-three or thirty-four he went to India, accompanied by his nephew, the late William Daniell, Esq. R.A., whose works it has frequently been our pleasing duty to notice in the *Lit. Gaz.* with the admiration which their excellence excited. The travellers were absent for ten years; during which period they formed the splendid collection of drawings, a great part of which has, in various shapes, appeared before the public. At Calcutta they published a set of views of that city, and, on their return to England, commenced the folio work entitled "*Oriental Scenery*," in six volumes; the whole of which, however, with the exception of the volume of "*Excavations*," was executed by Mr. William Daniell. Mr. Thomas Daniell seldom painted any except Eastern subjects; but some pictures of the house and grounds of the late Sir Charles Cockerell, of Seincote, in Gloucestershire, formed an exception to his general rule. After the completion of the large Indian work, he appeared before the public only in his productions annually exhibited at Somerset House. On his original drawings he set so high a value that he never would part with any of them, although on his return from India they were eagerly sought for by many persons of rank and wealth. He might have formed an extensive circle of friends; but as he had obtained (chiefly, we

have reason to believe, by his nephew's exertions) a competency, he preferred a retired life. He was never married, and, we understand, has left the whole of his property to a niece, who had resided with him for many years.

## ORIGINAL POETRY.

## THE KIND OLD FRIENDLY FEELINGS!

THE kind old friendly feelings! —  
We have their spirit yet,  
Though years and years have pass'd, old friend,  
Since thou and I last met!  
And something of grey Time's advance  
Seems in thy fading eye;  
Yet 'tis the same good honest glance  
I loved in times gone by: —  
Ere the kind old friendly feelings  
Had ever brought one sigh!  
The warm old friendly feelings! —  
Ah, who need yet be told  
No other links can bind the heart  
Like those loved links of old!  
Thy hand I joy'd in youth to clasp,  
The touch of age may shew;  
Yet 'tis the same true hearty grasp  
I loved so long ago!  
Ere the last old friendly feelings  
Had taught one tear to flow!  
The kind old friendly feelings! —  
Oh, seem they e'er less dear,  
Because some recollections  
May meet us with a tear? —  
Though hopes we shared, — the early beams  
Ambition shew'd our way,  
Have fled, dear friend, like morning dreams  
Before Truth's searching ray: —  
Still we've kept the kind old feelings  
That bless'd our youthful day! — C. SWAIN.

## THE DRAMA.

*Her Majesty's Theatre.* — On Saturday, in the revival of the rather heavy opera of *Beatrice di Tenda*, Persiani, as the heroine, sang charmingly, and threw great spirit and feeling into her performance altogether. The *Tarantule* was as capital as ever, and a very full house testified to the attractions of both.

*Covent Garden.* — On Wednesday the *Wonder* was repeated, and, if possible, with increased effect. In the quarrel-scene with *Violante*, and the delightful drunkenness of *Felix*, the acting was wrought up to perfection. Looking upon it, and indeed the whole character, as a piece of finished art, we have been rather surprised at some of our brother-critics laying weight upon the actual age of the performer. There is no age in the personation: it has all the vivacity of thirty, and all the experience of sixty. In short, it is what we said last week, a most important lesson in the highest walk of genteel comedy; and seeing it has a monstrous bad effect upon our estimation of *what we have* (with few exceptions) *been seeing* for some time past. It has, indeed, been melancholy work to witness some of the plays which delighted us heretofore; and at the fall of the curtain, so indelible has been the cast (again with the exception of perhaps two or three of the parts), we have asked ourselves, "Was this ever a good comedy; or have we dreamt that it was?" The Nisbett, with her fine Spanish eyes, and countenance to match, was made by nature for *Violante*; and her performance is every thing that could be desired. But the whole piece is excellently done, from old *Don* of Bartley; through the handsome *ensemble* of Mrs. Brougham, to the subordinate humours of Mrs. Orger and Mrs. Humby, and the absolutely *Highland Gibbis* of M<sup>r</sup>. Ian, whose every look and motion is redolent of the north.

After the *Wonder*, a farce was,

"Like the story of the bear and fiddle,  
Begun, but ended in the middle."

It was called the *Baronet*, and seemed to be amusing enough as far as it went; but some of the audience took to expressing their disappro-

bation of Mr. C. Mathews in the disguise of an old man, which he took in such high dudgeon, that he abruptly put a stop to the matter, by declaring that it was becoming too absurd to go on with. This was but scant justice to the memory of poor Haynes Baily, whose farce, we believe, it was. Not that we approve of cramming a "damned thing" down the public throat; but in this instance, we think, a different sort of appeal would have induced a patient hearing to the close.

**Haymarket.**—*Richelieu* has been produced here with the happiest effect. Macready's noble and refined personation of the Cardinal loses nothing by being seen in a smaller theatre. Any where it must bear off the palm of first-rate excellence.

On Thursday, a new farce, called *How to Pay the Rent*, Power shewing the way in his own inimitable style, was acted, after the introductory scenes, to shouts of laughter. These scenes are too long and belong to the "Fustian" school, the owner of which name lives over the way, whither we advise a large portion of this dialogue to be sent. For the rest, it is the most rollicking abandonment to fun, in the plot to force a miserly curmudgeon to allow an oppressed widow and her children to depart rent-free, that we ever enjoyed on the stage. Power, as *Morgan Rattler*, high plotter on the occasion, with trundle-bed for furniture, and a line of rope for wardrobe, is most gloriously at home; and Strickland, in the *Miser*; Mrs. W. Clifford, his housekeeper; and Mrs. F. Mathews, as *Kitty*, fill up the other characters with great talent and skill. The farce fully established itself the first night, as one of the merriest things going; and now that the *Three Grocers* are cut down to *One* act, the after-pieces here are just what they should be to send an audience laughing to their beds.

**Olympic.**—Some novelties have been brought out here; but, owing to a difficulty in getting the bills, we regret that we were not aware of them in time. Next week, we shall look out.

#### VARIETIES.

**Mr. Greenough's Evening.**—The first evening of the President of the Geographical Society took place on Wednesday, at his beautiful cottage in the Regent's Park, and was well attended by many gentlemen of distinguished science. A map of the county of Mayo, on a very large scale, attracted much attention, and seemed to be the perfection of mapping. As at the President's of the Royal Society, refreshments were abundantly provided.

**Marquess of Northampton's Soirées.**—The meeting of last Saturday was as brilliant as those before. Among the curiosities on the tables we noticed specimens of the new cloth made, not by weaving, but by compression like felt. It appeared to be very strong, and capable of resisting weather. It was also of various colours, from bright scarlet to sober brown, and of striped patterns.

**British Museum.**—Mr. Children having retired from the British Museum, Mr. Gray, so well known by his many works on natural history, and labours in that delightful science, has been appointed his successor. He is now the head of the zoological department.

**Società Armonica.**—The first of these subscription concerts was held on Monday evening, and the selection of music, vocal and instrumental, evinced the usual taste and judgment. Persiani, Medilles. De Varny and Parigiani, and Signor Colletti, were the vocalists. "Batti, Batti," was delightfully sung by the former.

The programme announced the first appearance of Madlle. Parigiani; her voice (a contralto) is not powerful but sweet, and as far as an opinion could be formed, from her being exceedingly nervous, well cultivated. Mr. Hayward was deservedly encored in a brilliantly executed fantasia on the violin; some of the higher movements of this young and clever violinist were peculiarly striking. So far every thing was well done; but we were sorry to observe a carelessness in the accompaniments, which appeared to fetter and distress the singers. In one instance, however (a duet, Persiani and Colletti), the accompaniment, twice wrongly commenced, produced laughter and hisses. This should not be, and the more especially in an orchestra comprising such talent.

#### Sciarada.

Pallida, pallida,  
Al di che involai  
Già vien la sera,  
Quando sollecito  
Il mio secondo  
Aduna il docile  
Grogge giocondo  
Fra il disarmico  
Primer, che il bosco  
Più volte replica  
Ov'è più fosco.  
E mentre volgesi  
Verso l'ovile  
Alata vergine  
Scuopre gentile,  
Che al terzo prossima  
Piange sospira  
E qual fernetica  
Quasi delira.  
Qual'è, mia giofondo  
Qual'è il profondo  
(Così la interroga  
Il mio secondo)  
Dolor, che t'agita  
Entro del petto  
E tanta recati  
Smania e dispetto?  
Scossa la vergine  
Alla dimanda  
Un sospir tenero  
Nuovo tramanda,  
E melancolica  
A quel che il gregge  
Con docta vergola  
Conduce e regge  
Il lacrimoso  
Caso le dice  
Del memorabile  
Tutto infelice.—*Paris Letter.*

#### TO CORRESPONDENTS.

The *Literary Gazette*.—The labours and anxieties of editing a periodical publication are sometimes compensated by kind and encouraging opinions, which afford much private satisfaction to those engaged in such tasks; but the following extract of a letter, coming as it does from a very distinguished person, is altogether so flattering, that we cannot refuse ourselves the gratification of that egotism which consists with publishing it. The writer says of our last No.:

"I pass your Review division, in which you make us so pleasantly acquainted with the last production of Mr. James, amuse us with your drollery (intermingled with remarks of much sound sense and observation) on the lineated project, place the latest aspects of the theory of mesmerism fairly before us, exhibit the principal features of the important colony of Ceylon, and sport with the anacronisms of the evergreen Captain Morik. I pass, I repeat, these well-grouped varieties, to thank you for a more original and greater fund of information on many interesting subjects than I have ever seen contained in any periodical of thrice the extent in European literature. I thank you particularly for the curious experiments on the effects of madder on the bones and teeth of animals, thus throwing light on their formation,—for the interesting and useful view of the produce and manufacture of silk,—for the new and important produce of gas from animal and other refuse,—for the concise, but perfect, analysis of Faraday's electrical researches, by which he proves the truth of the chemical theory, or opposition to that by contact,—and, not to mention minor questions, such as the notice of the French embassy, new steam vessel, improvements in photography, M. de Gasparin's remarks on the deleterious influence of certain dews, M. Brönsted's discourses on classic antiquities in art, and a long list of *écclésiastiques*, including reports of all our scientific societies at home, for the account of the French School of Arts, and Annual Parisian Exhibition, from which, in one of your pages, I have obtained a more complete insight into these matters than I ever got before from volumes of critical publication."

As most of these matters were contributed by others, our vanity in thus calling notice to them is the more pardonable; and from ourselves it is due to the parties to say how highly we value their co-operation.—*Ed. L. G.*

##### To the Editor of the *Literary Gazette*.

Sir,—The airs, "Jolly Noe" and "Nix my Dolly" having become popular, the composer, as usual, is beginning to be subjected to all sorts of hints and insinuations as to their originality.

As I never yet condescended to attach my name to any composition which I did not believe to be strictly my own, I am determined on no account to relinquish whatever little merit may be my due. Will you, therefore, be kind enough, through the medium of your paper, to allow me most publicly and unequivocally to lay claim to the composition of the two airs above mentioned?

I am, Sir,

Your obedient Servant,  
G. HERBERT RODWELL.

Garrick Club, April 2d, 1840.

We have so long and so often tried the other mode of address to our correspondents, &c., that we now beg leave to say to those who wish their communications *not* to be noticed, nor of use, that we shall feel particularly obliged to them to send them on Friday or Thursday, or at least very late on Wednesday evening. As we go to press on Friday night, these periods are either particularly inconvenient or impossible.—*Ed. L. G.*

Our Review of this week will be found more brief than usual, and of lighter material; but we were desirous to fill up the reports of scientific and literary Societies to the present date; and, upon the whole, we trust our readers will find the *dulce et utile* fairly balanced and blended.

• And very original and clever airs they are. Witness their popular applause every night at the Adelphi.—*Ed. L. G.*

Immediately will be published, in 3 vols. post 8vo.

**THE INTERDICT; a Novel.**  
By MRS. STEWARD.  
T. and W. Boone, 29 New Bond Street; and  
Oliver and Boyd, Edinburgh.

### BOOKS PUBLISHED THIS DAY.

MR. AINSWORTH'S NEW ROMANCE.

\* Those subscribers who have not yet received their Copies  
are requested to apply as soon as possible to Mr. Burns: or the  
work may be procured through their respective Booksellers.

In 18mo. price 2s. 6d. in boards, the 2d edition, enlarged, of  
**A LATIN SYNTAX for Beginners**, with

Copious Examples; being an Adaptation of Breder's  
"Little Latin Grammar" to the Eton Syntax, and intended as a  
Companion and Supplement to that work.

By THOMAS KERRICKVER ARNOLD, M.A.  
Rector of Lyndon, and late Fellow of Trinity College, Cambridge.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

Post 8vo. with Forty-four Illustrations of the most remarkable  
Animal and Vegetable Productions, price 12s. cloth.  
**THE CANADIAN NATURALIST.**

By P. H. GOSSE.  
\* This volume contains the observations of the author, recorded  
in supposed conversations between a father and his son, when  
wandering throughout the seasons of several years in the woods  
and fields of Lower Canada. The volume has the great merit of  
reality; its materials are drawn direct from nature; there is also  
about many parts of it a peculiar charm, which reminds one of  
"White's Seasons." The pictures are embellished with vignettes that,  
to the ordinary merit of beauty of execution, join the rare quality  
of distinctly expressed character.—"Spectator," March 14.

John Van Voorst, 1 Paternoster Row.

Price Six Shillings,  
**THE FOREIGN QUARTERLY**  
REVIEW, No. XLIX.

Contents:—

### REVIEWS OF NEW BOOKS.

*On the Construction of the Ark, as Adapted to the Naval Architecture of the Present Day; on the Equipment of Vessels; and on Steam Navigation to India.* By W. Radford, R.N. 12mo. pp. 90. London, 1840. Weale.

SINCE it is said, but very erroneously, that there is nothing new under the sun, the next best thing that can be done by way of approximation towards novelty is, perhaps, to revive the oldest matter of which human knowledge has any cognisance or tradition: and if Antediluvian, so much the better! Thus, for instance, the construction of Noah's Ark as an improvement upon modern ship-building!! It may be regretted that this vessel is the only great model of antiquity which can be referred to, in consequence of being particularly described in the Old Testament; and that there are no dock-yard accounts of the famous Argo, to which we might also go for a lesson in this important subject. Whether she was copper-bottomed or not, however, it is now impossible to determine; and whether brig or schooner rigged, is a secret buried in the graves of Castor and Pollux, or only to be gathered by astronomical observation.

The volume before us is, with propriety, dedicated to the Lords of the Admiralty; and it is to be hoped that they will not only give to its suggestions the consideration due to them, but call for the opinions of the Seppingses, Rennies, Waghorns, James Rosses, Denhams, and other eminent men acquainted with the art of propulsion on the sea, though exceedingly despised by Mr. Radford, who assures us—

"It has been clearly ascertained that none of our naval builders had any fixed standard, rule, or guide to direct them, but that every one designed, and laid down ships or vessels, in his own chimerical brain, and finished them with such improvements as suggested themselves in the progress of the work."

Now this was not the way Noah built his Ark; the only lamentable incident connected with which seems to have been that Steam-engines were not then invented. Otherwise the example would have been complete, and we should have learned the dimensions of the boilers, the length of the piston, the force of the stroke, the horse power, the quantity and quality of the fuel, the size of the paddle-wheels, the resistance per square inch, the disposition of the safety-valves, and all other particulars so desirable to be distinctly understood before one embarks on mighty floods, with a cargo beyond all price of insurance.

Four thousand years and upwards having elapsed since Captain Noah made his first voyage, our author is astonished that what was the result of a miraculous interference of Divine Providence for an unparalleled event, should not have been copied and followed for all ordinary occasions since that remote epoch. He thinks the Great Western and the British Queen tolerable as far as they go; but then they are not "three hundred cubits long, fifty cubits broad, and thirty cubits high," which he maintains to be the genuine, just, and serviceable dimensions for a navigable and seaworthy ship. On these grounds he proposes to establish a com-

pany (THE NOAHIC ARKITE COMPANY?), "for the purpose of maintaining a regular and systematic communication with India and England, by Steam Vessels particularly adapted to this most desirable undertaking" (p. xi.), i.e. by Steamers constructed agreeably to the principles of the Ark. And this appears to be the more natural, seeing (as Mr. R. states, page 2) it is well known the Ark was "first floated by the breaking up of the waters of the Caspian Sea and the Persian Gulf;" so that vessels of this class must be the best fitted for Eastern navigation; and the only difference need be that we will build of oak, teak, or, it may be, iron, instead of cypress wood. With regard to the shape of the Ark, the remarks are so very apposite and convincing, we must make room for them:—

"As many have expressed their surprise as to the square and oblong shape of the Ark, because it is not customary to see ships in this fashion; nevertheless, the little rush-box, in which the infant Moses floated, and was rescued by Pharaoh's daughter on the waters of the Nile, was after this construction.\* The vessel, or barque, where Danaë was confined with her child by Acrisius, was of this description. The barques, which the Romans called *Rates*, were of this figure. But we have no occasion to go down to the time of Pharaoh to prove the form and construction of the Ark, when it is borne in mind that this description of vessel is very common in the present day. The large barges that navigate up and down the Seine from Havre, Rouen, &c. to Paris, are many of them of this build. The same may be observed as to the barges that go up and down the Danube from Ulm to Vienna, Pest, Ofen, and down to Galatz in the Black Sea; and, to bring the matter still clearer to the views of our readers, the coal-barges on the Thames, which may be seen in such shoals about London Bridge, are precisely of the form and build of the Ark, only they want a little more length. And, lastly, the billy-hoys, which come up the Thames from Rochester, Chatham, and sometimes from Wisbech, and even from Hull, loaded very deep with bricks, stones, hay, straw, and other lumber, work up and down under sails in awful weather, to the surprise and astonishment of all those who have witnessed them turning up through the flats and channels at the mouth of the Thames, and which can be testified by thousands of living witnesses."

After this proof, what can be said? Little Moses in his ark of rushes, Danaë with her baby, the Roman first-*Rates*, the French and Austrian river-barges, and, "to bring the matter still clearer," our own Thames coal-barges in "shoals," and the billy-hoys, and why not the Fishing Punts?—all shew that your oblong square is far superior to your round Dutch bottoms, your sharp clippers, or any other variety of form adopted by the chimerical brains of pseudo-shipwrights.

Mr. Radford calculates that the Ark was of the noble burden of nineteen thousand, five hundred and thirty-one, and eighty-one ninety-fourths tons,—the fine fractional division being

come to according to the old plan; and for this reason, viz. that "the new method of measurement lately introduced by her majesty's Customs, upon the authority of an act of parliament passed in the last session, is worked by logarithms, with the particulars of which method and rules the author is not yet fully acquainted."

And Mr. R. insists much on the value of bulk, for he tells us:—

"After attaining the very best proportion and form of the parts, the important matter is size; the smaller the vessel with a proportionate propelling power, the smaller is the rate of speed, even in smooth water,—just as a long-legged animal gets on faster than a short-legged one."

Therefore a long-legged Ark is the desideratum: q. e. d.

Next to size, iron is most essential to the progress of Arkite navigation and the prosperity of the Noahic Company; since "Nature seems to have provided trees for us, for the purpose of ship-building, fitted for the slow progress hitherto attained, but of too slow growth for an increased activity of locomotion. The increase of population in England cannot afford forest-space, and the ample stores of iron, useless in former times for want of knowledge necessary to make them available, are now more valuable than the organic material of the forest."

In short, you cannot sink, nor you cannot burn, an iron Ark; and a Steamer of that material, of 19,000 odd tons burden, 300 cubits long, fifty broad, and thirty high, is your only vessel for India, by the Cape. Sir John Ross's Company, and big, high-decked, bathing-machine, were foolery in comparison. But it is strange to observe the perverseness of the human mind. After Mr. Radford has perfectly persuaded us to acquiesce in all his arguments, at page 56 he turns suddenly round upon us, and diminishes his size to a very cockboat:—

"The ships (he there declares) destined for this all-important service should be three hundred feet long, fifty feet broad, and thirty feet high, and three thousand, one hundred and ninety tons register burden, and should be built of  $\frac{3}{4}$  and  $\frac{1}{2}$  inch plate-iron; riveted and secured on angle and double-angle, fish-back iron double-flanged, of proportionate strength for the framing of the vessel, to be worked by three engines of two hundred horse-power each, all working on the same shaft."

"Her accommodations for passengers would be on the most splendid scale. Three large saloons, or dining-rooms; upwards of three hundred bed-places, divided into one hundred and fifty cabins, would be conveniently arranged. Some would be single, others double, and some would have four sleeping-berths in each cabin; with accommodations for steward's pantry, store-rooms, two smoking-rooms, twenty hot and shower-baths, twenty water-closets, all so classified and appointed, that no hotel in Europe could better afford comforts and luxuries for gentlemen, ladies, and children; and in order the better to adapt and reconcile all orders and degrees of passengers, their society, repairs,

\* See 2d chapter of Exodus, 1st to 10th verses."

and apartments, might be divided into different classes.

"And as every thing, in the present day, is called after Her Majesty Victoria, they may not inaptly be christened:—

- First.—The Queen of the Ocean.
- Second.—The Queen of the Seas.
- Third.—The Queen of the Isles.
- Fourth.—The Queen of the East.
- Fifth.—The Queen of the West.

As each of these stupendous vessels would cost, when completely equipped for sea, including engines and all necessary material, one hundred thousand pounds each, it would require a capital of half a million sterling to set such an establishment on a permanent basis.

"The commanders of such splendid vessels as those already described will be able to maintain a table equal to any hotel in the British metropolis, with a plentiful supply of Burgundy, champagne, and claret, à volonté—considerations of no little weight with our sea-faring brethren. The continued intercourse this establishment would keep up would not only be extended to the transport of all the present number of troops and passengers, but would afford to our fair friends a very pleasant and agreeable opportunity to many of the mammas and aunts, to take an Oriental trip to see their sons and nephews, accompanied by their accomplished daughters and nieces, for the benefit of their health; and be further the means of multiplying the fruitful scions of Albion's chaste daughters, by introducing them to the admiring and gallant sons of England's pride and strength on the fertile plains of Hindostan."

Who could wish to throw a cloud over such delightful prospects?—Not we. On the contrary, we long for a trip, and hope the day will speedily arrive when any of these "Queens," like Victoria herself to Albert, shall welcome us to her magnificence, beautiful accommodations, entertainments à volonté, and pleasures without bound. Oh! such a voyage—and such a voyage for life! Wizard and enchanting W. Radford, R.N.! ye have conjured up such hopes of happiness, that, unless you realise them through the N. A. Co., the world will become more discontented and miserable than it is;—and that is needless.

For ourselves, we exist but in the certain expectation that your illustrious exertions will be crowned with success; that the Zoological Society will employ no shipping to transport their beasts, but your arks; and that, on or before this day twelvemonths, namely, the 1st of April, 1841, we shall enjoy the inexpressible delight of stepping into the Queen of the Ocean, of the Isles, of the East, or of the West, as it may be, at Hungerford Market; and, to duce Captain Radford, visiting China (then conquered by Capt. Elliot) in an iron steamer with a state-room as large as Westminster Hall, and our cabin not less than the Chapel Royal where our own Queen was spliced to the excellent Prince A. (1.)

*Memoirs of the Princess Daschkaw, Lady of Honour to Catherine II. Empress of all the Russias. Written by Herself; comprising Letters of the Empress, and other Correspondence. Edited from the Originals, by Mrs. W. Bradford. 2 vols. 8vo. London, 1840. Colburn.*

MUCH of the interest belonging to these *Memoirs* has been superseded by Time. If they had been published thirty or forty years ago, the recollections of the profligate Catherine

would have appealed to a generation which knew something of her and her period; but these have passed away, and other emperors, empresses, courtiers, and ladies of honour, have since occupied the high stage, and also disappeared from view. We may also remark, that a perfectly true account of the court and intrigues of Catherine was not to be expected from the Princess Daschkaw, the participator in her revels, if not the partner in her vices. The editor endeavours to parry this objection, but we fear without effect; for it is impossible to receive the statements of one so intimately connected with the empress, one charged with being her associate in guilt, without a strong suspicion that both the *suppression veri* and the *suggestio falsi* would be employed.

With these deductions this "strange eventful history" may be read with interest, for it relates circumstances of extraordinary character; and exhibits life in many a striking position. There is, however, it must be added, a good deal of matter, and especially about the princess herself, of little or no consequence, which only serves to swell the work without adding to its attractions.

Under such circumstances, we select some passages from the narrative which the editor gives of her expedition to Russia in 1803, as the most likely portion of the work to interest our readers. Her approach to the princess was any thing but encouraging; for at Petersburg she tells us:—

"I should have spent a most agreeable time, had not my mind been very uneasy in consequence of stories which assailed me on every side respecting her whom I was henceforth to consider as a mother. She was represented to me as a most cruel and vindictive person, violent in her temper, and destructive of the happiness of every creature who was unfortunate enough to approach her. I was told that she lived in a castle situated in a dreary solitude, far removed from the society of any civilised beings, where she was all-powerful; and so devoid of principle, that she would invariably break open and read the letters which came to me, and those I sent to my friends, taking care to suppress any that might be displeasing to her. In a word, I created a sort of interest among my new acquaintances which was quite alarming, and I was repeatedly warned against putting myself into the power of a tyrant, from which it would be a species of miracle if I escaped. As these stories came from both English and Russians, I could at best only suppose them exaggerations of the truth, and enough remained to terrify me. Again I thought of her as a fairy, but no longer as that beneficent being who showered blessings wherever she appeared. Poisoned as my mind was, I shuddered at the idea of her; nor did the kind and maternal style of her letters deceive me; on the contrary, all her expressions of kindness appeared like snares to entangle me, and for a moment I was worked up to the resolution of returning to England, while I was yet safe and beyond the fatal effects of her power."

Matters, however, were by no means so bad, and the reception is a curious picture of manners. On arriving at Troitakoe, the writer says:—

"I beheld with terror the solitary castle, the scene of my threatened imprisonment! Its gates and doors were all thrown open, and as we proceeded through suites of apartments, many a figure glided past us, and many a face peeped out of side doors to gaze upon the strangers. At last the sorceress appeared! and if the singularity of her dress and figure fully

justified the title, so did the fascination of her countenance, where the noblest qualities of mind, blended with an expression of the softest sensibility, awed and attracted at the same instant. She wore a long cloth coat, with a large silver star on the left side; her head-dress was a man's nightcap, and round her neck was a coloured silk handkerchief, which friendship had consecrated to the same use for more than twenty years. It was the gift of Mrs. Hamilton, to secure her from taking cold one evening, and she would never, in her evening walks, wear any other. There was something in her reception of me at once so dignified, so affectionate, so true, so warm, and so graceful, that it went to my heart; and before she had uttered a word, except 'welcome,' I felt that I loved her more than any one I had seen since I quitted my own family.

"Each day," she continues, "seemed to increase her partiality and kindness towards me; and in her society, and that of Mlle. Istainoff, her niece, who always lived with her, my time passed most agreeably."

They went to Moscow, where the famous Count Orloff paid every attention to the princess; and our countrywoman says:—

"On being presented to him, I cannot but confess that I shrank involuntarily from giving my hand to be kissed by the too-celebrated Count Alexis Orloff, whilst, as I had been well tutored, it was necessary for me to touch his forehead with my lips, according to the old Russian mode, which was indispensable amongst the Muscovites. He was a magnificent-looking man, and wore a picture of the Empress Catherine, which was covered with a diamond instead of crystal or glass, and surrounded with splendid brilliants. His daughter's dress was made of English gingham, which contrasted comically with the splendour of her attendants, and the diamond cipher of the Empress Catherine, which she wore on her shoulder as *demoiselle d'honneur*. The persons who always attended behind the count's chair, or when he moved, were two heyducs and a dwarf: his fool roamed about more at liberty, amusing or tormenting the company, and as full of wit and malice as of freedom and folly. But the count's lovely daughter was the constant object of his tenderest care and admiration. She danced so beautifully, and with such native grace and dignity, that her movements seemed a sort of language, which expressed the simplicity and beauty of her mind. She performed, by the count's desire, the shawl dance, the gipsy, the Cossack, the tambourine, and some others; and two of the maid-servants were brought forward, to exhibit some figures that were not dignified enough for the young countess. At the end of each figure-dance she approached her father, kissed his hand and that of the princess, and he threw a shawl over her shoulders with a parent's watchful care. Besides these, the Cossaise, and waltz, and sundry quadrilles, gave the company an opportunity of taking part in the amusement; whilst slaves of various nations, and children, habited each in their own national costume, wandered through the suites of rooms which were thrown open, and added much to the peculiarity of the scene. Refreshments were boundless; and when supper was announced—but I must give up description, such was the quantity, and so indescribable the quality, of what was on the tables, and handed round and round in quick succession. The health of the princess was drunk to the sound of trumpets, every guest standing up; and as her slightest wish was instantly obeyed, various favourite national bal-

lads, which she chose me to hear, were made to interrupt from time to time the full band of music which had played during supper. When that was at length ended, the count rose up, and thanking the princess for the honour she had conferred on his poor house, led her in a polonaise, followed by all the company, in pairs, back to the ball-room; in the antechamber leading to which was now placed, in consequence of an order sent from the supper table, a full band of horn music, the first I had ever heard, and which the princess had described to me at Troitskoe. When we were not otherwise engaged, the princess had a circle at home, where the surviving persons who had distinguished themselves during the reign of Catherine, glittered in diamond stars, talked of her splendid court, of their different exploits and importance, fancying themselves young again, and brilliant as the sparkling gems with which their old bones were almost covered. I used to delight in looking at the princess amidst a group of her contemporaries;—she was a creature of so different an order; for while they were bedaubed with red and white paint, and covered with jewels and finery, the freshness of her complexion, which had never at any period of her life been assisted by rouge, and the simplicity of her singular dress, harmonising with the character of her countenance, at once distinguished her, with all her characteristic traits of truth, nobleness, and self-respect, accustomed to receive homage, but ignorant of the art of paying it."

The writer returned to England in December, 1808. We conclude with two other samples of Russian life:—

"I must tell you of a curious entertainment which we witnessed about three weeks ago. I was deploring to the princess the circumstance of losing sight of many nationalities, from our moving too high in the circle of society;—such as the domestic manners of the merchants, shopkeepers, &c. In one instance, at least, she good-naturedly promised my curiosity should be gratified; and a day was accordingly appointed, when a party of us, sixteen or seventeen in number, were to dine at the most celebrated tavern in Moscow. Every dish at table was served in the Russian style—not less, I dare say, than one hundred, and all peculiar to the country. To make the matter complete, *la maîtresse d'hôtel*, dressed in gold embroidery and diamonds, sat at the head of the table, with her face, neck, and arms, painted like a doll. This sort of painting is a national usage, and has been so ever since Russia was in existence. Our attendants, to the number of forty, were bearded men, dressed in yellow, purple, and party-coloured shirts, tucked up at the wrists, so as to leave half of their arms naked, and without coats or waistcoats. There was a boy who played on the organ, and who, for the permission to do so, paid the master of the tavern several hundred roubles a-year, which shews how much the tavern was frequented, and how music is here considered a necessary of life. After coffee, a group of gipsies was brought for our amusement, dressed in gold brocaded shawls, tied on one shoulder, and with ear-rings formed of various coins. How beautifully they danced the Bohemian and Egyptian dances, calling to one's recollection the dancing figures of Hercules! At some moments, when fear was to be expressed, their vivacity bordered on frenzy; and their movements, accompanied by abrupt cries, gave so wild and preternatural an effect, that it was difficult to imagine them inhabitants of this drowsy planet."

"Talking of nationality and of the peasants, would you like to hear of some of the Christmas games with which the young people of that class amuse themselves on Christmas-eve? Figure to yourself, then, a party joined hand-in-hand, taking their places in a circle round a bowl set on a table, or, if you prefer it, a caldron, like the witches in 'Macbeth,' but without a fire under it. Into this machine a bit of bread, some salt, a little water, and a piece of charcoal being thrown, to 'make the gruel thick and slab,' as the charm for what is to ensue, another vessel is placed over it, as the depository of the pledges of those who wish to try their fortune. This is so covered as to allow the pledges, such as a ring, a key, a snuff-box, to be slipped in unseen. During the former part of the operation, the performers dance round, singing a chorus, of which the following is a literal, not an elegant translation:—

'Glory be to God in heaven. Glory!  
Glory to our empress on earth. Glory!  
May our empress never grow old. Glory!  
May her flowered gown never be torn. Glory!  
May her good horses never be past labour. Glory!  
We have also sung for the bread. Glory!  
For the bread we have sung and done it honour. Glory!'

Then commences the drawing of the lots, which is done in this manner: one sings a song, meant to describe, in a rude sort of allegory, the fortune awaiting the owner of the pledge, which is drawn out by some blind-folded Cupid of the party from the upper region of the bowl, at the moment the song ceases. Immediately follows the chorus, joined in by all:—

'For whom we have sung  
Good luck! good luck!  
Thus shall it soon be for her  
Whose lot is drawn.'

Here, for your further edification, is half-a-dozen of these mystic songs, with the fortune they respectively denote:—

'The blacksmith goes from his forge,  
His shute is rent and torn;  
One side is worth a thousand roubles,  
The other only a hundred.

Chorus—For whom, &c.  
This promises riches.'

'Away skips the mushroom to the fire-wood,  
To seek a white lady mushroom;  
'Tis not a mushroom we seek,  
But a lady of high birth.

Chorus—For whom, &c.  
A marriage for convenience.'

'As on the oak-tree two doves are fed  
Into each other's embraces.

Chorus—For whom, &c.  
A love-marriage.'

'A pike quitted the white lake,  
She trailed her tail to Novgorod;  
Her skin is silvered o'er,  
Her tail and head are burnished gold.

Chorus—For whom, &c.

A foreign marriage.'

'An orphan is seated over the warm ashes,  
This orphan waits there to pick up crumbs from the oven.

Chorus—For whom, &c.

Misfortune.'

'Now the bear swims  
Across a rapid river;  
After swimming he shakes himself,  
And shakes off a bushel of fleas.

Chorus—For whom, &c.

Great good luck and riches in abundance.'

This is the grand prize of the evening, and reserved for the last-drawn pledge. I have made it one of this elegant selection, to shew that the same superstition respecting the above-named vermin, in dreams and sorcery, exists in this country as in Ireland. I know, indeed, a very charming young person, with the title of exceleney, who is in the utmost delight whenever her washerwoman happens to enclose a flea amongst her clean linen."

*Manners and Customs of the New Zealanders, &c. &c. With Remarks on intending Emigrants, &c.* By J. S. Polack, Esq. 2 vols. 12mo. London, 1840. Madden and Co.

MR. POLACK's preceding publication, giving an account of some six years' residence in New Zealand, has made him so generally and so popularly known, that he needs no new introduction from us on this his second appearance. All we shall say is, that these volumes are full of curious and interesting matter; of which we shall content ourselves with giving only one characteristic example. Mr. Polack, having returned to a village, witnesses a national scene, which is thus described:—

"While these laments were the order of the day, we went to the place where the feast, or rather market, was allotted. A long lane was formed on an extensive level plain, fifty feet in width, by two high walls, formed by perhaps upwards of ten thousand baskets of potatoes, kumeras, Indian corn (*Holcus indicus*), taro (*arum*), water-melons, turnips preserved (*kou*), steamed kernels of the native fruit (*karaká*), baked roots of the *ti* palm-tree (*korou*), a quantity of dried cod, eels, and other fish, also of shell-fish, bundles of fern-root, onions, peaches, grapes, &c. Against each portion sat the proprietor and his friends, who had erected a few stakes to windward, matted with bushes in place of a booth, as protection against wind and rain. In addition to the above fare were a number of pigs, of various age and size, easily distinguished, from the piercing shrill squeak to the huffing and sonorous grunt of their formidably tasked great progenitors. On entering this scene of gaiety the most clamorous sounds issued from every point; hard dealers squalling their dissent from a price required; a few coterie dancing a variety of *hakás*; others, who prided themselves in approaching the *mairé Anglaise*, were giving imitations, as exaggerated as ridiculous. Some few amused themselves by a foot-race, wrestling, boxing, in a knowledge of which they decidedly failed. Throwing reeds or small spears at a target took the attention of another party; balancing spears on the palm of the hand, pipes on the nose, reeds on the forehead, muskets on the breast, also had their admirers; climbing trees, flying kites, learned from Europeans, served to amuse the boys; while others again, anxious to become proficient in the arts, made attempts to picture ships, men riding on pigs, canoes, and numerous obscenities on the exterior of the baskets, in red earth and charcoal. Several old gentlemen, 'bearded like a pard,' were stretched at full length playing with round pebbles, the primitive school-boy game, known to vulgar ken as 'up the spout;' two other elders were scientifically engaged applying a sharp blade of grass across the sensitive noses of two irritable cats,—this stimulating feat attracted the attention of many bystanders, who were betting which of the two could retain poor pussy longest, or which apply the grass most judiciously. Ever and anon were to be seen, perched on the top of a pyramid of provisions, a Stentor-lunged native, who had visited Port Jackson, and was imitating the 'sayings and doings' of the auctioneers in that colony. Each party had their audience, for a vast concourse had assembled from distant districts as at annual fairs in Europe. In addition to the produce above mentioned, a number of pigs ready broiled, roasted, boiled, and baked, were also exhibited for sale, whole, in quarters, and in portions, for present sustenance, or export; birds in a cooked state were also exposed. Nor were the purchases from Europeans forgot to

be exposed: muskets, powder, dilapidated clothing, that would have instinctively shrunk from an exposure even in Monmouth Street, tobacco, soap, spades, hoes, the favourite tomahawk, axes, iron pots, also empty bottles, tin canisters, cartridge-boxes, lead balls, and bullet-moulds, were to be seen; creditable specimens of native ingenuity, in the form of stocks for broken muskets, handles for hoes, spades, helms for axes, carved bowls (*ná posaka wakiro*), for holding feathers and little trinkets, hand-nets, fishing-lines, &c., and a variety of articles, as the shop-bills have it, 'too numerous to particularise.' Amid the hubbub and humours of these fairs, disputations for bargains are loudly contested for. Every seller has predetermined to demand a larger price than he can possibly expect to obtain, and the buyer at first offers much lower than he probably expects will be taken; and thus the jabbering of both parties, who concede a something, but accompanied with slurs and jokes on the hardness of each other's heart (*ná kou pakéti*.) After giving way on both sides, they approach nearer to a fair price, when an agreement is made. Rarely, indeed, is the 'biter bit' in these transactions. The ladies, of course, are not apathetic spectators in this display; the customs of the country permit them to enjoy themselves as much as they like without the restrictions placed on them, as in the east, and demi-civilised states in the north, where groundless jealousies cause them to be immured almost as closely as Britons would confine the ferocious animals. In New Zealand they eat with the men, accompany their lovers, husbands, relatives, and friends, to a feast or a war expedition, influencing the several tribes by taking an active concern in all business of life. They are consulted alike in public and domestic affairs, bring large dowries to their husbands, and even join the war council, which they at periods aid by their deliberations. At the Huiunga, a grateful opportunity was afforded for conversation, which, carried on without intermission, added not a little to the din, which would have stunned the ears of any being but a native. As a private *tête-à-tête* was out of the question, every person was obliged to screech their sayings, opinions, and discussions, which among the ladies was generally confined to articles of dress and ornament recently imported by the Europeans, the appearance of their ladies, the belles and beaux of their own circles, their own individual hopes, fears, wishes, longings, &c. New sources of uproar continually occur: thus a half-starved cur, instinctively alive to his own wishes and longings, watching the moment his vehement mistress turns her back to reiterate some dogma or proposition, steals slyly to the savoury cooked pork exposed for the gratification of another kind of customer, and with the tug of an enthusiast purloins the envied morsel; he in turn is pursued by his own kind, proving that among the canine race there is no honesty among thieves. This new fracas engages the attention of the women, who no sooner discover the cause than hasten to add the effect, by following the lank herd, stick in hand: in this pursuit the children follow, running their bare and tender feet among wood, and splinters, and cockle-shells, which are strewn about the plain, the refuse of many a meal, adding not a little to the noise and bustle of the fair. The company continued to arrive, and as every new-comer was recognised, the terrific yells of the *tangi* ascended in chorus, making 'confusion worse confounded.' The dresses of some of the new company were of motley

appearance; one fellow elicited shouts of wonder and applause, having been supplied by an European with an enormous nose (*maak*), whose rubicund and ample proportion was a theme for renewed delight and merriment. The elders were bedaubed with oil, red earth, and blue clay; and one grotesque monster had painted his forehead, nose, and chin, a bright yellow, obtained from the bark of a tree, every other part of his face and person being of a glaring fiery red. Mats made of dog's skin sewed together were displayed in great number, and a small garment of the feathers of the kievi-kievi bird was sported with great pride and state by the wearer. As the afternoon began to close be-

fore the cooks began the functions allotted to them, about three hundred yards from the lane where the motley and numerous company had assembled, a number of pigs, who had not been silent spectators of the stirring scene, in consequence of being exposed to the barking of the many dogs, without whom society in New Zealand would not be accounted as select, now gave their last complaints under the hands of the butchers, who perform the operation by drowning, or strangulation, that the blood in the animal may be preserved, the law of 'never waste' (*káoré mau mau*) being most sedulously attended to. As the shades of night encompassed the place, the assemblage gathered to-

gether in small circles, generally with some blazing fogots in the centre, which, glaring on their expressive countenances and animated forms, heightened the romantic effect of the scene."

The work is illustrated with woodcuts, of which we have given specimens in the opposite page.

*The Hope of the World, and Other Poems.*

By Charles Mackay. 12mo. pp. 203. London, 1840. Bentley.

*THE HOPE OF THE WORLD* is a poem in a style rarely attempted nowadays; and, when attempted, still more rarely do we meet with the harmonious flow of numbers which Mr. Mackay presents to us. He is a daring man who calls himself even an humble follower of that "simple, natural, and enduring school of poetry, which has produced such writers as Pope, Goldsmith, Rogers, and Campbell," and such our author declares himself to be. But without daring there cannot be success, and we find many beautiful passages in *The Hope of the World* doing honour to the school to which that poem belongs. But to the proof. Mr. Mackay thus hails the art of printing:—

"Scared by its light old Superstition shook,  
And hid her face before the printed book!  
Knowledge walked forth, no longer for the few,  
Unveiling shy her sweet face to the view;  
No longer timid, taciturn, and coy,  
But on an errand of unbounded joy,  
She roam'd the earth, and shew'd her eyes so bright,  
To all who chose to gaze upon their light.  
No more sole visitant to hermit's cell,  
Or convent grey, or porch where schoolmen dwell.  
She showered her blessings more profusely down  
On plodding men, and hinds with labour brown;  
Knock'd with her gentle tap at poor men's doors,  
And woo'd their sons to taste her bounteous stores;  
Cheer'd lonely hearths with bliss till then unfeild,  
Taught cheeks to glow and eyes with tears to melt  
At joys or sorrows of their fellow-men,  
Told by the poet's or historian's pen:  
Aid, best of gifts, bore in her bosom fair,  
The Book divine, that ransoms from despair,  
That cheers the weary with its words of love,  
And points to doubting hearts the realms above."

Again, *Discovery and Invention*, in their combined offices, are here ably depicted:—

"From all the elements *Discovery* drew  
The inmost secrets veil'd from mortal view;  
And apt *Invention*, watchful by her side,  
Each, as it rose, to man's delight applied;—  
Employed the water, caught th' unwilling wind,  
And made strong fire the slave to stronger mind;  
Mingled contending elements at will,  
Curb'd and restrain'd, and made them each fulfil  
His destined purpose in her curious plan,  
All for the service and the ease of man;—  
And, chief of triumphs, in a happy hour,  
Chanced on the secret of the mighty power  
That sleeps conceal'd in every drop that flows  
Round the huge earth, or freezes in its snows.  
*Discovery* smiled with wonder at the sight,  
And brisk *Invention* seized it with delight;  
And lo! puissant Steam, a servant mild,  
Titan in force, but duteous as a child,  
Put forth for man a strength unknown before,  
And raised with mighty arms the ponderous ore;  
Plied the quick shuttles in the weaver's room,  
Sparing his strength while it enrich'd his loom;  
Whirl'd its great wheels triumphant o'er the deep,  
Though tides and winds were adverse or asleep;  
And on the land adown the assisting rail,  
Drove its hot chariot swifter than the gale."

Did our space allow, we should not be at a loss to substantiate our opinion as to the merits of this poem by further quotation, but we have now "a crow to pluck" with Mr. Mackay. In the miscellaneous poems of the volume he forgets his protest against the "high-feeding style of poetry"—again we refer to his preface—and indulges in many an impassioned lay in which the depths of feeling are ably stirred; nor can we agree with him, that compositions of this class are necessarily "mere rhyme-weaving" or the "unsubstantial fritter of mere words." Mr. Mackay is far from an unknown writer, and seldom have we met with any thing, either in prose or verse, from his pen

which does not bespeak a purity of sentiment and a facility of composition making us well pleased to renew our acquaintance.

MISS SINCLAIR'S SCOTLAND AND THE SCOTCH.

[Second notice: conclusion.]

WE resume with pleasure our illustrations of this pleasant volume; and first, here is a fine picture of a clear sea:—

"When the Doge of Venice next marries the sea, he should come to Skye, where his bride may be seen in her utmost possible beauty, with

'Weeds that sparkle, and with waves that blaze.'

On approaching the shore, we saw into the clear crystal depths so distinctly, that you might have read a newspaper lying underneath. Here the medusas had a beautiful appearance, as a continual succession of them floated upwards in the water, painted in so great a variety of brilliant colours, that they looked like china plates, while some were so transparent, they might have been mistaken for glass tumblers. A perfect garden of sea-weed and shells, exhibiting the most vivid colours, and divided by patches of glittering sand, looked so beautiful and inviting, that I wished myself endowed with the lungs of a fish, to have dived down, and walked about in those cool retreats, where the mermaid's song might have been most appropriately sung."

Women are not to be despised any where, but in the north they are uncommonly useful creatures. Thus, on crossing Loch Ness, we are informed:—

"This little skiff is rowed in general by a Highland girl, but the ferry-woman was absent, which I regretted, as she is said to pull better than any man. You would be amused to see what useful people women are in the far north. They drive the carts, hold the ploughs, in short, do all the manual labour; and if a cottager loses his horse or ox, or any other beast of burden, he marries a wife to make up the difference."

In Cawdor Castle, of histrionic celebrity, Miss S. writes:—

"We were shewn a large iron box, which the ancestor of Lord Cawdor received when this castle was about to be built. The casket is now empty, but was then filled with gold, destined to pay the whole expense of building, on the express condition that this treasure should be placed on a donkey's back, when the animal was to be turned loose, with a few strokes of the whip, and at the first place where he afterwards stood still, the foundation must immediately be laid. Many houses are so ill situated, one might imagine that nothing wiser than a donkey had fixed on the site; but this long-eared architect excelled most 'capability men.' He paused near the river, beside a very fine thorn-tree, and one of the rooms has been built round the stem, which yet stands bare and rugged within the apartment, its root on the floor, and its head piercing the ceiling. This has a singular effect, as if it had forced a way through the roof; and, if tradition speak the truth, this aged block of wood must now be at least six hundred years of age; coeval with the time of Macbeth, when the thane of Cawdor was 'a prosperous gentleman.' In the external wall of Cawdor Castle, about half way from the summit, a thriving, full-grown gooseberry bush has contrived to take root, though we could not but wonder where it found any nourishment or support! It clings to the interstices of a solid stone wall, nine feet thick,

and there produces an ample crop of gooseberries, the most genuine wall-fruit I have seen, which might have been gathered if we could have made a long arm, to reach about ten feet down from the nearest window. Baron Munchausen's cherry-tree growing on a stag's head was not much more surprising. In this delightful old castle we were shewn King Duncan's chain armour. There are four houses in Scotland where that monarch was undoubtedly murdered: Glamis Castle; a blacksmith's hut near Forres; Inverness Castle, now superseded by the gaol; and Cawdor Castle, which appears to me the most appropriate scene for the occasion, being quite a ready-made tragedy in itself. I walked slowly up the very steps which Lady Macbeth ascended, trying to feel as like Mrs. Siddons as possible; but if A—— had treated us to one of Kean's very best starts in Macbeth, he would have precipitated the whole party to the bottom of a deep spiral staircase. We reached, at length, a most ominous-looking door, very low, and creaking on the hinges with a most unearthly sound, which opened into the fatal apartment, where there is a vaulted stone roof. I was wound up now to behold a scene quite à la Shakspeare; but, alas! a sad disappointment awaited us! all within was fresh, clean, and new, exhibiting not so much as a grain of dust, or a stain of blood, and we were informed that an accident had destroyed every relic of antiquity. In the chimney of this old room, a colony of jackdaws established their nests, which took fire one night, when King Duncan's bed perished, and the whole proofs of the murder were destroyed. Another bed which we were shewn in this house might have been substituted, as it was the most dismal piece of furniture I ever beheld, with plumes of black feathers at every corner, silver ornaments and velvet hangings, so that if mounted on wheels like a hearse, it would have been quite fit for the undertaker. You may trace out half the history of Scotland in this entertaining old castle! I wish we had four pair of eyes at least to look about us with! We were next ushered into a crevice, which can scarcely be dignified with the name of a closet, where old Lord Lovat, at the age of eighty, remained in concealment during six weeks after escaping from the battle of Culloden. If we ever have to flee for our lives, I could not desire a better hiding-place; for, though the English troops had certain information that the aged peer was confined in this very house, they never succeeded in discovering him! The entrance is most curious and complicated, for I stood on the leads close beside the place without detecting a nook in which so much as his wig could have been harboured. A sort of supplementary elevation, like a chimney, rose above the roof; by placing a ladder against which we scrambled to a narrow platform, and there saw a nearly invisible door, scarcely wider than the entrance to a dog-kennel. After creeping with difficulty into this aperture, we found an apartment under a pent roof, twice the size of a bathing-machine, where Lord Lovat remained, day after day, and week after week, almost within sight of his own magnificent estates. A very few miles off were the trees on which he formerly hanged so many of his own retainers, the halls in which he once executed tyrannical sway, and the house in which both his amiable, high-born wives successively wore out their miserable existences, in a species of rigid imprisonment. Early in life, he erected a marble tablet in the parish church, bearing a splendid panegyric on himself; and when his friend, Sir

Robert Monro, remonstrated on the absurdity of this 'romantic stuff,' he said that his clan must believe whatever he told them. I wonder he did not leave an equally imaginary portrait of his countenance, rather than trust Hogarth's pencil, who found the temptation to caricature quite irresistible, and threatened, when Lord Lovat refused to pay for his picture, that he would 'add a tail, and sell it for the frontispiece of a menagerie.' It is surprising he did not burn the painting at last, but he stands recorded, at his own request,

'To future times a libel and a jest.'

Had Lord Lovat been stanch to either side, our sympathy would have been greater; but a prospective patent, creating him Duke of Fraser, nailed the weathercock of his opinions; and such patents are often the best remedy for the hot and cold fits of a politician, who 'foams a patriot to subside a peer.' We gazed over the wall, upwards of sixty feet high, where Lord Lovat, wrapped in blankets, was let down by ropes, at last, to make his escape; and I became perfectly giddy when fancying the poor old peer, accustomed to his easy chair by the fireside, and his newspaper, thus launched into the air, like a spider on a thread, and swinging about in the wind. All true Highlanders must lament that a Fraser, one of the clan, incurred the disgrace of betraying his chief, who was traced to a large tree on his own property, and yielded himself up, saying, 'It is not your cleverness that has caught me now, but four-score and four.' When death became inevitable, he encountered it with extraordinary hardihood; and the fall of a scaffold having killed several spectators, at the very moment of his execution, he turned round, saying, 'Ay, the mair mischief the better sport!' The ancestors at Cawdor Castle evidently did not sit to the best artists. They seem to have worn armour and full-bottomed wigs like other people; and though we could not quite distinguish the ladies from the gentlemen, they all have the usual allowance of eyes and noses; yet, in respect to their beauty, least said is, perhaps, soonest mended; but some of them were most ineffable-looking. In ancient times, heiresses were obliged occasionally to make very unexpected journeys; and here Muriella Calder, who inherited Calder, now Cawdor Castle, was carried off in 1510, without being much consulted on the subject, by the Campbells, and married to the Earl of Argyll's second son. His coat-of-arms and initials are placed over the entrance, and magnificently emblazoned also on a curious antique chimney-piece. A more recent transaction of this kind did not end quite so well. A brother of the first Duke of Argyll carried off an English heiress, Miss Wharton, but the marriage was immediately dissolved. The culprit himself escaped any severer penalty; but Sir John Johnston, who had assisted in the frolic, was hanged. One ancestor, wearing a Nova Scotia riband, whose portrait was introduced to us, seems to have been a perfect Samson. An iron gate is shewn, with bars fit for Newgate, which tradition assures us, upon its veracity, that this gentleman carried on his back fifteen miles! The worthy housekeeper believes with all her might, as in duty bound; but I should like to have seen it done. One room here is hung entirely round with tapestry about two hundred years old, said to be the work of Lady Henrietta Stewart's own individual needle; but she could as easily have carried the iron gate as manufactured all we saw, in which she was, of course, assisted by a phalanx of maids.

The wall behind these hangings is not even plastered, but this fine old tapestry grates against a rough stone wall, being hung up, as children wear their pinafores, to conceal defects; and now, having explored as carefully, from the kitchen to the sky-lights, as if the house were to be let furnished, 'seen Tuesdays, Thursdays, and Saturdays,' we took leave of our worthy old cicerone with the customary ceremony, as housekeepers must all have their hands crossed with silver or gold, like gipsies, which I would much rather do to hear stories of the past than prophecies of the future."

Connected with the foregoing—"About three miles from Beaulieu, we passed an extremely romantic cottage, with an extremely romantic history. It was built on a small island five years ago, by the descendant of Simon Lord Lovat, for the alleged descendants of Prince Charles, two very accomplished gentlemen, who have never distinctly stated their claim, but are much esteemed in the neighbourhood, and received at some houses with almost royal honours. We saw them for a moment near their own gate, both accoutred in splendid Highland costume, precisely copied from portraits of 'The Young Chevalier,' with the white cockade mounted on their bonnets, their plaids flying, and feathers waving in the breeze, and certainly the resemblance is striking, but further than this the deponent saith not. The family of Lovat, unable to bestow the whole island of Great Britain, according to their inclinations, have succeeded at least in providing an island, situated in 'The Dream,' where any one they please may be privileged to exclaim,

'I am monarch of all I survey.  
My right there is none to dispute.'

The river dashes vehemently round this charming green isle, which rises abruptly out of the water, crowned with trees, and surrounded by curious pyramids of rock, like conglomerated gravel, washed by the tumultuous stream into a hundred fantastic shapes, resembling turrets, steeples, castles, and even trees of stone. The cottage looks as if its walls had been covered with a border plaid, as the dark grey stones are checked with stripes of white cement; a ferry-boat was moored on one side of the island, and a rustic bridge, extremely unsafe-looking, hung on the other, while the whole scene was hemmed in by a circle of such magnificent wooded hills as might make the fortune of any ordinary place. The falls of Beaulieu, or more properly Beaulieu, are like a cascade of silver churned into foam, and fretted into appearing as white as a sheet, among the iron-looking rocks. The best view is from a garden near the road, belonging to the parish clergyman; but if his 'vineyard' be no better cared for than his garden, I should be sorry for the parishioners. This ought to be one of the loveliest spots upon earth, but is now such a mere bear-garden of weeds, I felt much inclined to take up a hoe myself. We admired Lord Lovat's beautiful park and grounds, though rather at a loss to guess why his cottage-looking house was ever dignified with the name of Beaufort Castle, not being more like our idea of a castle than a pistol is to a cannon. Near this, 1200 acres of forest have been planted in two years, which compensates in some degree for thousands having been wrenched out of the Drhaim at one fell swoop. I would subscribe something to get the ancient ruin of Beaulieu Priory cleaned out and made tidy, for you never witnessed a more disorderly scene of desolation. Probably every grain of dust in this old cemetery once formed part of a human frame; but now, open stone

coffins, human bones, long spiry grass, nettles and tomb-stones, are all miscellaneously heaped together; and when I saw the ornamented tablets which had formerly been meant to express the dignity and worth of those who lay scattered around, I could not but think of the tears that must have fallen when those graves were closed, and of the many hopes, and fears, and joys, and sorrows like our own, which once filled the heads and hearts of the silent, neglected dead, sleeping unconsciously at our feet: but how transient is the honour given by man, even when carved on stone! We waste much sympathy on the departed in such a scene, for to them the body is of no more importance than the mantle of Elijah after he ascended to heaven; but yet for our own sakes, if men wish hereafter to be laid at rest in decency and peace, they should respect the sanctuary of others, even though their name and kindred be forgotten, for there is not an emotion or an affection can live in the heart of any living man, that the dead in their time have not also shared."

But we have reviewed this volume at as much length as is fair towards a publication of its size; and, instead of looking back, beg leave to look only a little way forward to our repose, which we do in a concluding anecdote of an ancient Romish priest at Erchless Castle:—

"Father Philip has long, to use our Scottish phraseology, 'enjoyed' very bad health, and is, moreover, quite superannuated. I often wish a retiring pension were provided for aged clergymen of our persuasion, as well as for half-pay officers, though there would be many perhaps as unwilling to relax in their pastoral labours as the venerable Arnold, who replied, when his friends represented that his years and infirmities required more rest, 'No! I shall soon have all eternity to rest in.'"

*The Creation of the World.* Addressed to R. J. Murchison, Esq., and Dedicated to the Geological Society. By W. Cockburn, D.D. Dean of York. 4to. pp. 40. London, 1840. Hatchard and Son.

THE Dean of York is a sturdy opponent of the geologists, and impugns all the deductions of the science as represented by the Sedgwick, Bucklands, Lyells, Phillipses, Conybeares, and Murchisons of its upper strata. He tells them they all "follow one another like sheep in a beaten track;" and as such a course can never make the walk of inquiry either broad or wide, the Rev. Doctor maps out a path of his own, which he holds to be the true exposition of the creation, deluge, and subsequent changes in the globe which we inhabit.

"I conceive (he says) that the world was first formed of materials probably in a liquid state, which, having a rotatory motion given to them, hardened on the outside into a solid crust of stone—consisting of felspar, mica, and quartz. The first, an apparently solid clay (which forms a part of almost every rock), was probably the great cement which united the crystals of the harder materials, and formed in different combinations those similar stones, granite, porphyry, gneiss, &c., which are well named the primitive rocks. Now, there is nothing incredible in supposing that upon this crust the Creator placed land and water, and peopled them with fish and animals. This simple arrangement probably continued two or three thousand years, during which time the rivers bringing down sand and clay from the land, and the tides rubbing against the primitive rocks, might form new combinations of stony matter, and deposit them in the tranquil sea in successive thin layers—as mica-schist, clay-

slate, &c., well and simply called—the slaty rocks. We may then, sir, easily believe from what we see, that the flood-gates of heaven were opened, and that the clouds poured down rain upon the earth in vast superabundance, and covered it with water. We may easily believe that this great catastrophe was attended with numerous violent volcanoes, both in sea and on land."

We need go no further than to add, that by a succession of innumerable volcanoes the author accounts for all the phenomena on the earth's surface with which man can become acquainted; and that the latest volcano is a small quarto pamphlet, the eruption before us, exploded under the very seats of the Royal Geological Society.

## MISCELLANEOUS.

*The Fruits of Endowment. Being a List of upwards of 2000 Authors, who have, from the Reformation to the Present Time, enjoyed Prebendal or other Non-cure Endowments of the Church of England.* 8vo. double cols. London, 1840. M'Dowall.

THIS volume contains an account of a vast multitude of learned and valuable publications, which have emanated from a class of men whom it is much the fashion of the day to stigmatise as drones, and whose reputations the compiler thus endeavours to redeem from the charge. Much has been accomplished, but much also has been omitted; and we can only say with truth that the list is a considerable, but by no means a complete or very accurate contribution to our acquaintance with the extent of our obligations to these clerical writers.

*The Countess.* By Theodore S. Fay, Esq. author of "Norman Leslie," &c. 3 vols. London, 1840. Bentley.

THE hero of this novel objects to duelling upon so immovable a principle that he submits to be publicly struck, and to have a friend killed in his stead for espousing his cause; and, indeed, endures every species of humiliation rather than commit what he considers to be a mortal crime. Among the rest he risks the loss of the Lady Ina, whom he loves to desperation; and forfeits for a season the good opinion of the society in which he moved. Berlin is the principal scene of these events,—but it changes to Paris during the Revolution, where the parties are involved in perilous adventures,—and finishes happily in England. The serious interest of the story is diversified by the introduction of some vulgar English travellers. The materials are not so pliable as the purpose is moral; and in the style there are a good many peculiarities which mark the country of the author.

*The Truth of Revelation, demonstrated by an Appeal to Existing Monuments, Sculptures, Gems, Coins, and Medals.* By John Murray, F.S.A. &c. &c. 8vo. pp. 380. London, 1840. Smith; Southampton, Fletcher and Son.

THIS is a second edition, and we do not remember having seen or said anything of the first. Of that now before us we may observe, that the title appears to us to be a misnomer. It is not the truth of revelation that the author attempts to demonstrate, but the truth of many portions of the Bible, geographical, personal, traditional, and historical. In doing this he adduces a great deal of very interesting evidence, and though many of his facts and arguments are liable to be questioned, there yet remains such a mass of curious information that the volume will well repay

the pains of a careful perusal. On the geological issue Mr. Murray's remarks are temperate, and possess some originality.

*David Low's Illustrations of the Breeds of Domestic Animals of the British Islands.*

Part II. London, 1840. Longman and Co. THE second part of these beautiful prints, lithography coloured to the very perfection of nature, with the descriptive memoirs of Mr. Low, at once so useful to the farmer and so agreeable to the man of science, is quite equal to the first, upon which we bestowed so unreserved a panegyric. The history of the origin, co-mixture, and acclimatising of the sheep is full of interest. The specimens figured plate 1. are curious to the southern eye, being of the breed of the Zetland and Orkney Islands, and picturesque enough for a landscape-painter. Plate 2. of sheep belonging to the higher Welsh mountains, and improved by Lord Adare; Plate 3. soft-wooled sheep of Wales; and Plate 4. breed of the Wicklow Mountains, are all varieties of this creature, so important in its services to man, which will attract the attention of the great agricultural division of our country, whilst their forms please the eye of the connoisseur; and the accounts of crosses, &c. to produce flesh and wool of superior qualities, teach lessons of much consequence, both to the producer and consumer of these necessities of life. The work is truly one of national value.

*L'Europe pendant le Consulat et l'Empire de Napoléon.* Par M. Capefigue. 2 tomes, 8vo. 1840. Paris, Pitois-Levrault; London, Dulau and Co.

M. CAPEFIGUE is a voluminous writer, and has here treated of a remarkable period in a not very remarkable manner. His book is, nevertheless, very readable; and if we do not meet with much that is new or with ought to change our previous opinions, we can truly say of it, that it presents a striking view of fifteen years of extraordinary events.

*Serviens ad Legem. A Report of Proceedings before the Privy Council, and in the Court of Common Pleas, in Relation to a Warrant for the Suppression of the Ancient Privileges of the Serjeants-at-Law. With Explanatory Documents and Notes.* By J. Manning, Serjeant-at-Law. 8vo. pp. 360. London, 1840. Longman and Co.

THIS inquiry into the rights and privileges of Serjeants-at-Law involves many points, not only of curious legal, but of general antiquity, that, instead of finding this volume a dry one, we have been really much interested with its contents; and obtained much information of political and historical value, which should place the work, beyond the shelves of law libraries, in all collections of books of national character. Serjeant Manning has displayed no less ability than research on the occasion.

*Trinity College Prize Essay for 1839, on the Colonial Policy of the Ancients.* By William John Butler, Scholar of the College. 1840. Cambridge, Deighton; London, Parker.

THIS little essay manifests a degree of ability, learning, and research, fully justifying the high honour which has been conferred upon it. After observing that "of the three principal nations of antiquity, the chief colonising motive in the Phœnicians seems to have been commerce; in the Greeks, safety from invaders, and opposing factions in the state; in the Romans, security for their conquests;" Mr. Butler enters into a variety of elaborate but perspicuous details, especially with reference to the Phœnician and Greek colonies (which were much more powerful and important than those of Rome), to

show the manner in which the respective and characteristic objects contemplated were effected. In conclusion, he remarks:—"It is impossible to institute any comparison between these and modern colonies; for, in the latter, a fresh view is taken of the subject, and an additional and more forcible motive urges us forward,—the diffusion of Christianity. Where this is forgotten, no colonies will flourish; this 'must influence our policy; under this banner we must conquer; and we must be content to have our success measured by the attention paid to this. With the ancients the case was different. We must measure the excellence of their policy, not so much by their arrangements as by the results; and where we see a colony prosperous, yet retaining a filial affection to the parent state, we may rest assured that in the policy which could insure this, nothing could be radically wrong."

*The Law relating to India, and the East India Company. With Notes and an Appendix.* 4to. pp. 621. London, 1840. Allen and Co.

THIS appears to be a valuable digest of all the charters and laws affecting the East India Company and our Indian empire. Many a ponderous volume has been ransacked for its contents; and we presume that a very numerous class of persons, interested in the administration of justice and the good government of India, will have great cause to be pleased with a work so well calculated to abridge their labours and lead them aright in the knotty questions which demand their consideration.

*The Religious Wars of France, from the Accession of Henry II. to the Peace of Vermina,* by Jonathan Duncan, Esq. B.A. author of the "Memoirs of the Dukes of Normandy," &c. Pp. 340. (London, Rickerby.)—An episode belonging to a period in the history of France, of the most painful and sanguinary description; a part of which has lately been so admirably illustrated by the pen of Mr. James ("The Huguenots; a Tale of the French Protestants," reviewed in the *Literary Gazette*, No. 1143). Mr. Duncan has compressed it in a skillful manner from Thuanus, Davila, and others; and he has strikingly enforced the precept that persecution for the sake of religion is the abhorrent source of every evil that can afflict humanity.

*Poems of Chivalry, Fairy, and the Olden Time,* by Walter Pridaux, Esq. Pp. 166. (London, Smith, Elder, and Co.)—This is a volume of pleasing compositions, in which various legends and fairy tales are agreeably told. Occasionally rather brilliant passages occur, and some nervous lines and high poetical expressions struck us as we ran through the light performance.

## ARTS AND SCIENCES.

## GEOLOGICAL SOCIETY.

MARCH 25th. Dr. Buckland, in the chair.—A paper was read, 'On the Age of the Limestones of South Devon,' by Mr. Lonsdale. The object of this communication being to shew the nature and limits of the author's claim to having been the first to infer, from zoological evidence, that the limestones of Southern Devon would prove to be of the age of the old red sandstone, it commences with a summary of the opinions previously entertained respecting those limestones. The authors quoted are Woodward, (1722), Da Costa, Maton, Playfair, Berger, L. A. Necker, De Luc, T. Thomson, Kidd, W. Smith, Brande, W. Phillips, Hennah, Greenough, Sedgwick, W. Conybeare, Buckland, Dufrenoy, Elie de Beaumont, De la Beche, Pridaux, Boase, J. Phillips, Austen, Murchison, and Bakewell. By these geologists the limestones are placed in the primary, transition or greywacke, and carboniferous series; Mr. Pridaux being the only author who ascribes them, in part, on mineral character, to the old red sandstone; and Mr. J. Phillips, in the article "Geology" in the "Encyclopædia Metropolitana," hesitating to place them in a

definite position, in consequence of the resemblance of many of the shells to species found in the mountain limestone. This variety of opinion, Mr. Lonsdale conceives, arose from the want of sufficient evidence at the time the several works were written; and he states, that if a better or more decided classification can now be adopted, it must be ascribed to the mass of information since accumulated, not merely from Devonshire, but other and distant parts of the kingdom. Until the organic remains of the mountain limestone and the Silurian system had been determined, the former overlying, and the latter underlying, the old red sandstone, and proved to be each well marked and perfectly distinct suites, it was impossible to determine to what formation a series of beds could belong, the fossils of which were in great part new, and others resembled closely carboniferous shells. The author then proceeds to shew what was the zoological evidence on which he ventured, in December 1837, to conclude that the South Devon limestones would prove to be of the age of the old red sandstone. Previously to that period he had examined, in part, the corals of the Silurian system, and of South Devonshire, and had satisfied himself that some of the species are common to both; he had also examined, with Mr. James Sowerby, Mr. Hennah's valuable collection of fossils from the neighbourhood of Plymouth, and had become aware, by the remarks of Mr. Sowerby, that certain of the shells could with difficulty, if at all, be distinguished from mountain limestone species; and that some were distinct. In December 1837, he examined with Mr. Austen a portion of that gentleman's collection of Newton Bushel fossils, and though he ventured to differ from some of the identifications with mountain limestone species pointed out to him, yet those shells agreed so much in aspect with the testacea of the carboniferous fauna, that he could not doubt the beds from which they had been obtained had some connexion with the mountain limestone system: the same collection also proved, that associated with these shells were corals common in the Silurian system. From information previously communicated to him by Mr. Austen, he had also become aware that the *Calceola sandalina* occurs likewise in beds connected with the limestones. It was, therefore, by combining this evidence, the presence in the same strata of shells identical with mountain limestone species of Silurian corals, the *Calceola sandalina*, and various distinct testacea, that he was induced to suggest that the South Devon limestones are of an age intermediate between the carboniferous and Silurian systems, and consequently of that of the old red sandstone. In alluding to Professor Sedgwick and Mr. Murchison's adoption of the suggestion in 1839, and their bold application of it to all the older sedimentary rocks of Devon and Cornwall, the author states that the fullest acknowledgments are made in the papers containing their present views of the structure of these counties, of the source from which they derived the suggestion. Appended to the paper is a list of fossils, somewhat hastily prepared, and necessarily very incomplete, from the limited nature of the materials at the author's command. It consists of sixty-three species, twelve of which are considered common to the carboniferous and Devonian limestones; forty-two to be characteristic of the Devonian strata; and nine, seven of which are corals, to occur both in Devonshire and Siluria: doubts are, however, expressed respecting the identification of the two species of shells. The author

then observed, should it be urged that it was unjustifiable to assume from organic remains alone the age of the Devonshire limestones, it may be replied, that in a district of which little in 1837 was really known, which is cut off by the granite of Dartmoor from the only base-line of the country, the culm measures of central Devon, proved in 1836 by Professor Sedgwick and Mr. Murchison to be the representative of the true coal measures, organic remains are the only test by which the age of strata so situated can be determined; and in support of his argument he advances the recent establishment in Cutch, and the desert to the east of it, from the examination of suites of fossils brought to England by Captain Smee and Captain Grant, and others procured by Colonel Pottinger at the request of Colonel Sykes, of a series of beds, unquestionably of the age of the oolites of England, the fossils agreeing in their general characters with those of that geological epoch in this country, and in many instances specifically undistinguishable. In this case, mineral character and order of superposition are proved to have been valueless guides, for the rocks are totally different in character from those of England; and where no connecting base, unassisted by fossils, could be established, no comparative order of superposition could be proved. Of the importance of organic remains in identifying districts nearer home, the following instances were pointed out:—In M. Dumont's work on the geology of the province of Liege, published in 1832, the strata immediately beneath the mountain limestone are divided into three systems, but without any definite comparison with the formations which underlie that deposit in England. At the meeting of the Geological Society of France, at Mezières, in September 1835, Dr. Buckland proposed the first comparison between the systems of M. Dumont and the subdivisions of the Silurian system of Mr. Murchison, and principally on the resemblance of the corals with those found at Dudley and Wenlock; he, however, pointed out the occurrence of the old red sandstone between Namur and Dinant, as well as near Hny and Engis; and M. Constant Prévost and M. Roget also identified, at the same time, certain beds between Namur and Dinant, with that formation. In 1838, M. Dumont visited England for the purpose of examining the Silurian region; and, on his return, he laid before the Royal Academy of Bruxelles a table differing from that of Dr. Buckland only in drawing more closely the terms of comparison, and in identifying the two upper divisions of the *terrain ardoisier* with the Cambrian system. He stated also, in a report which accompanied the table, that the old red sandstone was most probably wanting in Belgium; or, if it exist, that it must be considered as a great development of the superior part of the upper Ludlow rock. In M. Dumont's work, before mentioned, lists are given of the fossils from each system; and, on examining them, for the purpose of determining how far the comparison of the Belgian and Silurian systems could be established by organic remains, Mr. Lonsdale ascertained that, out of twenty-two species, only four can be considered as peculiar to the Silurian system; and of those he believes two may be erroneous identifications; that five species are common to the Belgian beds and the mountain limestone, and thirteen to the Belgian and Devonian systems. These lists, Mr. Lonsdale states, are small, but bear internal evidence of having been carefully drawn up; and he considers that they afford sufficient

proof that the systems from which they were obtained are not Silurian, but partake of the same intermediate character as the Devonian strata. The other case alluded to in the paper refers to the older beds of the Bas Boulonnais. Those strata were identified by M. de Verneuil with the Silurian series of England, particularly an intermediate bed of limestone, which he placed on a parallel with the Wenlock. This identification was fully admitted at the meeting of the French Geological Society at Boulogne, in September last, and at which several members of the Geological Society of London assisted. When, however, doubts were thrown out respecting the fossils of the Liege country, it was stated by those practically acquainted with the country, that if Liege had been wrongly identified, the older beds of the Bas Boulonnais had been wrongly identified also; and an examination, by the author of this paper, of fossils obtained from that district, with published lists, has proved that the inference was correct,—that there exists in the Bas Boulonnais the same assemblage of mixed mountain limestone and Silurian species with others which are distinct, as occur in the Liege country and Devonshire.—A communication was afterwards read 'On the Bone-Caves of Devonshire,' by R. A. C. Austen, Esq. After noticing the two theories which have been proposed to account for the introduction of the remains of mammalia into caves—one, that the carcasses were drawn in by hyenas or bears; the other, that the bones were washed in by diluvial action—Mr. Austen offers his own solution of the phenomena presented by the Devonshire caves, but without reference to any general explanation of those in other districts. With respect to the habits of hyenas, he quotes the following passage from Cuvier, "*Les hyènes se tiennent solitaires dans les parties montagneuses;*" and he adds, least of all do they inhabit caves, nor have they the courage to attack any formidable animal, living on the putrid flesh and bones which they find in their nightly prowlings, and which they devour on the spot. M. Marcel de Serres is also quoted, to prove that the gluttony of the hyena is only equalled by his cowardice. The lion, on the contrary, pursues living prey, prostrating it at one spring, and bearing it off to his lair; which African travellers report to be chasms, caves, or overhanging ledges of rock. On these grounds, Mr. Austen is induced to infer that the bones found in the Devonshire caves are not the residue of the prey of hyenas, but of the lion, tiger, or other larger feline animals, teeth and remains of which occur in the Plymouth and Hutton caves, and in many others in different parts of Europe.

## LINNEAN SOCIETY.

MR. FORSTER in the chair.—The Bulletin of the Royal Academy of Brussels, and the fourth volume of Baron Delessert's interesting figures, illustrating the new plants described in De Candolle's "*Prodromus*," were among the works presented to the Society.—Specimens of a singular and elegant form of Gall, on the leaves of a new species of oak from Mexico, were exhibited by Dr. Farre.—A collection of flowering specimens of plants from the Birmingham Botanic Gardens were exhibited, and among them the *Manglesia glabrata*, *Veronica formosa*, *Grevillea punicea*, *Choroxema cordata*, and the Irish variety of *Erica mediterranea*.—Mr. Yarrell exhibited a specimen of the *Oscillatoria corium*, from a watercourse in a meadow near Totnes: some of the matted pieces taken

up were found to be seventy-nine feet in length.—Read, a continuation of Mr. Smith's paper 'On a New Arrangement of the Genera of Ferns.'

## BOTANICAL SOCIETY.

FRIDAY 3d. Mr. J. E. Gray, President, in the chair.—Announced, an extensive collection of foreign plants, presented from Mr. Emerson.—Read, an introductory paper, by Mrs. Riley, to a 'Monograph on Ferns.'—The law of compensation endowing the cryptogamous tribes with a more ample share of minute interest, atones for their want of flowers or fragrance. Ferns, moreover, are interesting from their elegance of form and different methods of reproduction, besides their seeds, growing from offsets, tubers, and bulbs. These facts were enlarged upon in Mrs. Riley's paper, and especially with reference to the *Aspidium bulbiferum*, *Asplenium flabellifolium*, *Vicparum*, and *Petrache*, specimens of which were exhibited. The increasing attention paid to this tribe of plants was referred to, and various collections of the foreign ferns noticed, as well as the suitability of the smaller species for growing in glazed cases.

## ZOOLOGICAL SOCIETY.

SIR G. CLERK in the chair.—Fellows were elected. Balance carried to account on the 1st of April, 1468*l.* 17*s.* 6*d.* Since the last meeting, a fine lion and a favourite monkey have died. The mortality among the animals is much to be regretted.—Mr. Gould has addressed a short, but interesting communication, to the Society, dated from Van Dieman's Land. On the passage out he observes that the seas literally teem with the feathered race, especially the storm petrels. Some of the albatrosses, prions, and other large kinds of petrels, have been observed to follow the ship for several thousands of miles. Until Mr. Gould ascertained that they were nocturnal, it was a matter of surprise to him how the birds which were seen around the vessel at nightfall were to be observed crossing the wake at daybreak on the following morning; the ship having frequently run a distance of nearly 100 miles during the night. The short visit which Mr. Gould has paid to the continent of Australia convinces him that much of interest there remains buried in obscurity. The drought last season was most distressing to the colonists. Mr. Gould warmly acknowledges the unremitting kindness of Sir John Franklin.

## UNITED SERVICE INSTITUTION.

At the first evening meeting, which we briefly noticed, there were among the presents a valuable collection of ancient armour and modern arms, presented by the Master-General of the Ordnance; a hat, once belonging to Lord Nelson, presented by J. P. Powell, Esq.; and a splendid sword and dirk, belonging to the gallant Captain Frank Abney Hastings, who distinguished himself in the Greek navy, in command of their steam frigate *Kaepia*, and died of a wound received in a sharp action with a Turkish squadron, in the Gulf of Lepanto, in 1826.—A paper was read, by the Rev. Richard Sheepshanks, 'On the Box Sextant, and other Portable Instruments for determining Latitude and Longitude.' A greater degree of accuracy can be attained with this instrument than is generally imagined. It is very portable, and does not excite the cupidity of uncivilised tribes so much as the larger sextants, the specula and reading glasses of which are often held by them as great prizes. On one occasion, Mungo Park had the mortification of seeing the glasses of

his sextant adorning the dress of an African king. A chronometer adjusted for carrying on the person will go almost as well as one in gimbals: with these, and an artificial horizon (a mercurial one, if possible), very desirable results may be obtained. Latitude may be ascertained within 30", by observing stars north and south of the zenith. Longitude would depend too much on a single chronometer for implicit reliance.—Mr. Bakewell exhibited to the meeting his newly-invented Angle-meter.

The second evening meeting was held on Monday, Captain W. Ramsay, R.N. in the chair.—Numerous presents were exhibited; amongst them a valuable collection of silver ores, brought from South America by the late Commander W. Hallowell Carew, R.N., and presented by his mother, Lady Hallowell Carew, to the museum; a small gun and carriage, brought from Pitcairn's Island, by Captain H. W. Bruce, of H.M.S. *Imogene*, having formerly belonged to the Bounty; also a large grapnel, to which a curious history is attached: it belonged to a Japanese boat which, in a typhoon, was blown off the coast, and, after a voyage of eleven months and a half, reached *Whyarua*, in *Woahoo*, December 1832. For the last three months they had been without water. They had a large supply of rice; and they allayed their thirst by washing their mouths and bodies frequently with salt water. The vessel was about seventy tons, with one very large mast amidships, a small one on the sternhead, and a still smaller one abaft on the taffrail: she was strongly built, and fastened with flat, wedge-shaped nails: she had six anchors, or grapnels, one of which was brought home by Captain Bruce, and now presented. The crew could not converse with the Chinese, but understood most of their written characters.—A collection of various articles recovered from the Royal George, and presented to the museum by Colonel Pasley.—A paper was read; 'Ascent of Mount William the Fourth, Australian Alps,' by Dr. John Lhotsky. Dr. Lhotsky and his party commenced their ascent on March 12th, 1834. *Foot-marks of the Natives.*—"As we proceeded further, I saw that by a succession of projecting angles, the snowy river turned from W.S.W. through west to north-east, and finally east. At the left of the hills, another of the paths of the aborigines was observed, and this a very striking one. The number of tribes which, as we shall see hereafter, wander every year on the top of the Bulga, may disperse as occasion may require in Napoleon's Valley; yet, when they come to this pass, only the hill alluded to, and certain lines of it, 'become passable, the right one being altogether too abrupt and too steep; and thus, in the succession of ages, their naked feet have worn out marks in the barren surface of the hills, and have penetrated into the granite of which it is composed. I called this 'Papua's Hill'; and I have fragments of granite triturated, as it were, by their feet; so that the felspar has disappeared, and left behind holes which give the specimens a curious and scoria-like appearance." *Eating-moths.*—"These shelves and cavities in the rock are, in the summer-time, the abode of immense numbers of moths. Animal life is an object which the poor native of New Holland never omits to make use of. The path above described owes its origin to the circumstance that all the tribes of the adjoining country resort to the top of this mountain for the sake of these moths. They make bundles or torches of the herbage of the mountain, ignite them, and by these means kill the moths. Having either singed their wings or killed

them, they carry them in nets, made of stringy bark, towards Jamieson's flat, where fire-wood abounds, dig large holes, and covering the heaps of moths with brands and ashes, reduce them, by roasting, to an edible state, having separated the ashes and soil admixed by sifting through a net. *Coley*, who had tasted the prepared moth as it is brought down by some of the blacks to Menoro, said that it tastes like roasted almonds, which is probable, as the entrails of many lepidopterous insects are replete with a milky juice."—Adjourned.

## PARIS LETTER.

Academy of Sciences, April 7, 1840.

SITTING of March 30. M. Poisson in the chair.—M. Arago made some remarks to the Academy on a "Treatise of Astronomy," by M. de Pontécoulant, presented to that body at its last meeting. In this work, at page 23 of the Introduction, the author remarks, that an error of nearly fifty-seven toises had been made in the measurement of the arc of the meridian between Montjouy and Formentera; and further on, at page 26, in mentioning the regularity and accuracy of the observations at the Greenwich Observatory, he says that he had never seen any thing equal to these observations in any other observatory in Europe. M. Arago observed, that the Observatory of Paris, being included in those of Europe thus condemned by M. de Pontécoulant, he could not, as chief of that institution, allow the remark to go uncontradicted; and he would say that these remarks were not only made with levity, but that they were malevolent and calumnious. He spoke not only on behalf of himself, but also for the young astronomers connected with that institution. They were only three in number, Messrs. E. Bouvard, Laugier, and Plantamour; whereas the Observatory of Greenwich had eight assistants. It was not true that fewer observations had been made at Paris than at Greenwich; far from it. In 1837, the number of observations made at Greenwich with the meridian telescope was 2938; while at Paris, as the printed table which he had had the honour of laying before the Academy proved, the number had been 7486: at Greenwich, where there were two mural circles, the number of observations had been 4570; at Paris, where there was only one mural circle, the number was 4214. Thus the total observations at Greenwich for 1837 were 7508; while at Paris they amounted to 11,700. With regard to the error in the measurement of the arc of the meridian, he must observe, that what was called measurement in that case comprised two operations; viz. the determination of the latitudes at each end of the arc, and the operations of the triangulation. As for the latitude of Formentera, it had been determined first by M. Biot and himself,\* and afterwards by M. Biot alone, according to a new method. The exact accordance of the two results left no doubt as to the exactitude of their determinations. With regard to the operations of the triangulation there was something unusual in them, from the immense size of some of the sides of the triangles and the excess of the sphericity of the earth, which made the sum of the angles

\* M. Arago began his public career by assisting Méchain and Delambre in measuring an arc of the meridian: in pursuit of which he established observatories at Valencia and in the Balearic Islands. The Spaniards took him for a sorcerer, imprisoned him, and condemned him to death. He escaped to Africa, and wandered about for a long time before he could get back to France. He is always a vehement supporter of the claims of his country and countrymen to the honours of scientific inventions or improvements.—*Ed. L. G.*

much more than 180 degrees: in deducting, however, the amount of that excess, which it was always easy to determine, they found that they had always fallen exactly on a sum of 180 degrees. Every thing, therefore, led them to infer that the operations had been accurately conducted; and, indeed, with such superior instruments as had been used, it was hardly possible to be otherwise. The only way to prove that the operations were not correct would be to commence them over again. This was what had been done, and the calculations had been confided to Messrs. Burkhardt, Bouvart, and Mathieu: would it be contended that these gentlemen had also made errors? The coincidence of the three results which they had separately arrived at left no room for such a supposition. However, since M. Puissant, who had since repeated the same calculations, had arrived at a result which shewed a slight difference, it had been determined to make a new calculation, which was now going on, and which, when terminated, would perhaps bring them to the truth. Still he would contend that, even if the error signalled by M. Puissant were admitted, it would be erroneous to say that there had been an error in the measurement of the arc, as M. de Pontécoulant had asserted. [Here the subject dropped for the day, but it has produced a letter from M. de Pontécoulant in one of the public journals, and promises to give rise to a very angry controversy. Some of the organs of the public press attempt to give a political character to it.]

A letter was read from M. Colin, shewing that, in 1828, M. Plagne had arrived at the same discovery of the quantity of saccharine matter in the *vesou* juice as M. Pélignot had done in his recent experiments; he had operated on sugar on the Comorand coast, and found it to contain more than 20 per cent of crystallisable sugar, which might all be extracted when the evaporation was conducted rapidly, and the temperature did not exceed boiling heat.

M. Julien sent to the Academy some specimens of wax made in China, by a species of small insect not at all related to the bee, and which were commonly found on two peculiar kinds of plants there.

M. Vogel, of Frankfort, communicated the result of some experiments as to the production of sound, by the stopping of the magneto-electric current from a voltaic pile communicating with an iron-bar in a glass cylinder.

A letter was read from Professor Melloni, on the reflection of caloric rays by an unpolished glass surface. He found that if the temperature was an elevated one, the dispersion of the rays was nearly the same as for rays of light; but if it was not elevated, the dispersion was very feeble.

M. de Humboldt addressed a letter to the Academy, with the elements of the third comet, calculated by Messrs. Galle and Encke. He observed that these elements agreed so well with those of the comet of 1097, observed at Pekin, that the identity of the two comets could not be doubted. In 1468, a large comet had been seen, which, from the descriptions left of it, might be considered identical with this third comet of Galle; if so, its period would be about 370 years. M. Arago remarked that the elements of this comet, which had been calculated at the Paris Observatory by the three assistant observers, each separately agreed exactly, not only with each other, but also with those of Messrs. Galle and Encke.

M. Turpin read a description of a new species

of mucedineous insect, given to him by M. Biot, which he called the *Penicillium Biotii*, because he had observed it in a phial that contained distilled water, with a small portion of *destrine*.

M. Verneuil read a memoir on the marked distinction between the carboniferous and the Silurian systems of rocks: he shewed that the greater portion of the species of Silurian fossils had ceased to exist at the carboniferous period; and that this change of species had taken place in situations very distant from each other. He supported his statements by proofs from Spitzbergen to the Lake Titicaca, in Bolivia.

M. Paraudier presented a memoir on the extraction of hydraulic lime from jurassic calcareous formations on the east of France.

M. Filhon sent to the Academy the results of his observations on the comparative level of the sea: 1. at Brest and Lorient; 2. at Cancale and Lorient; 3. at Cancale and Noirmoutier (mouth of the Loire). There was a perfect identity of level between the first two stations, for the mean altitudes of the sea; for the second stations, it appeared that the level was fifty-nine centimetres lower at Lorient than at Cancale; and, for the third station, 1 metre .02 centimetres (1.02 metre) lower at Noirmoutier than at Cancale. The observations had been made with great care and nicety.

M. Liouville read the report of a committee on a memoir by M. Leverrier, on the periodical inequalities of the seven principal planets. The Academy ordered this memoir to be printed.

*Académie Royale de Toulouse.*—At the sitting of 19th March, M. Lagreze-Fossat contributed a memoir on the muscle of the Rhine, *Unio margaritifera*, and stated that he had found a specimen of this bivalve in the Garonne, at Moissac.

“Les Soirées de S. A. R. Henri de Bourbon, duc de Bordeaux,” in 2 vols. 8vo. is the title of a work which is published by a legitimist statesman, and which contains a collection of saying and doings of an amiable prince prematurely oppressed by the hand of political destiny. It is worth reading.

We have seen the twenty-fifth volume of the “Encyclopédie des Gens du Monde;” it sustains the character of this useful publication, to which Messrs. Guizot, Sismondi, Depping, and other eminent men, are contributors.

The official collection of ordonnances and statutes for the making and verifying of standard weights and measures has been recently printed by government; it forms a duodecimo volume, with a quarto atlas of plates. It is not of much interest, except to French lawyers and practical men. The tables appended to it are very clear, and easy of reference.

The Report of the Central Jury of Admission and Prizes for the great Exhibition of Arts and Manufactures of last year has just made its appearance, in 3 vols. 8vo. This is a work that ought to be in the hands of every manufacturer, since it contains a luminous and detailed account of the existing state of French industry.

Baron Charles Dupin pronounced the funeral eulogium of the late eminent mathematician, M. de Prony, in the Chamber of Peers a few days ago; on which occasion he quoted the following letter addressed to M. de Prony, as president of the class of mathematical sciences, by Buonaparte, after his reception as member of that body, on 31st December, 1797:—

“Citoyen Président.—Le suffrage des hommes distingués qui composent l’Institut m’honore. Je sens bien qu’avant d’être leur égal, je serai toujours leur écolier. S’il était une manière plus expressive de leur faire connaître l’estime que j’ai pour eux, je m’en servais. Les

vraies conquêtes, les seules qui ne donnent jamais aucun regret, sont celles qu’on fait sur l’ignorance. L’occupation la plus honorable comme la plus utile pour les nations, c’est de contribuer à l’extension des idées humaines. La vraie puissance de la république française doit consister désormais à ne pas permettre qu’il existe une seule idée qu’elle ne lui appartienne.”

“BUONAPARTE.”

The Minister of Public Instruction, M. Cousin, since coming into office, has established new prizes in all the law and medical faculties of the kingdom; and has also ordered the formation of a corps of *Agrégés*, or Associate Professors in the Faculties of Letters and Sciences, with leave to lecture. All professorships must be filled up when vacancies occur from these bodies; and the *agrégés* are to be elected only after seven public examinations and competitions. The minister knows how to encourage literature and science in another substantial manner, for on Thursday week he invited a large party of distinguished men in each of these branches: among the literati present were Messrs. Victor Hugo, Casimir Delavigne, Scribe, Auber, Mignet, Letronne, Andral, Sainte-Beuve, and Lemercier.

M. Sauro, who has been attached to the editorship of the “*Moniteur Universel*” ever since 1795, but who was not appointed chief editor till 1800, has just retired from that post—the father of all journalists! Old Madame Agasse, the widow of the proprietor, died not long ago, and M. Sauro immediately determined on retiring. He has been succeeded by M. Grün, an advocate of the Paris bar.—Arnal, the inimitable comedian of the Vaudeville Théâtre, has been writing a comic epistle in verse to his friend, the well-known actor of the Gymnase Dramatique. It is a sketch of his life, and shews him in quite a new light; and, to the Parisians, is just the very thing to enchant them.—The engagement of Mlle. Rachel at the Théâtre Française, just signed, is for 60,000 francs per annum.—Messrs. Arago, Bouvard, and Gambey, of the Bureau des Longitudes, have received from the King of the Belgians the decorations of the order of Leopold: the first as officer, the two other *savans* as chevaliers. They had been engaged in comparing the Belgian weights and measures with the new French metrical and decimal standards.—Professor Thibaut, of Heidelberg, died there on the 28th ult., aged 69. He had filled the chair of Roman Law for many years with much distinction. He was also a profound musician.

On the 1st January, 1840, Sir John Herschel consigned the old and celebrated telescope constructed by his father at Slough, to perpetual rest. This was done with some ceremony; the only notice of which that we have received has come to us by no less roundabout a circuit than Nantes. The great astronomer is connected with that place, and some of his friends have received from one of the family a communication on the subject, which has been printed by the “Breton,”—one of the best French papers, by the way, out of Paris. It had been determined to preserve the metal tube of the instrument, with its metallic mirror, and to form of the whole a kind of monument in honour of the old telescope. All the wood-work, and whatever was liable to prompt decay, had been removed. The tube, therefore, was placed horizontally, and in the meridian line, upon pillars of brick in the midst of the circle of brick-work, on which the scaffolding for managing the telescope had formerly been erected, and within which the ground is now planted with shrubs. The reflector of the telescope was brightly polished for the occasion; and at noon precisely, on January 1st, the commencement of the astronomical year, Sir

John Herschel, Lady Herschel, their seven children, their governess, and some persons who had been attached to the establishment of his father, walked in procession round the monument several times, and then entered the tube, where they seated themselves on benches prepared for the purpose. The following verses, composed by one of the sons of Sir John Herschel, were then sung, all the party joining in the chorus; after which they again marched round the telescope, and the extremity of the tube was fastened up. The day was closed by a family party.

In the old telescope's tube we sit,  
And the shades of the past around us fit;  
His requiem sing we, with shout and din,  
While the old year goes out and the new comes in.

Chorus.

Merrily, merrily, let us all sing,  
And make the old telescope rattle and ring!

Full fifty years did he laugh at the storm,  
And the blast could not shake his majestic form;  
Now prone he lies, where he once stood high,  
And search'd the deep heaven with his broad bright eye.

Merrily, merrily, &c.

There are wonders no living wight hath seen,  
Which within this hollow have pictured been,  
Which mortal record can ne'er recall,  
And are known to Him only who made them all.

Merrily, merrily, &c.

Here watched our father the wintry night,  
And his gaze hath been fed with pre-Adamite light;  
While planets above him in mystic dance,  
Sent down on his toils a propitious glance.

Merrily, merrily, &c.

He has stretched him quietly down at length,  
To bask in the starlight his giant strength;  
And Time shall here a tough morsel find,  
For his steel-devouring teeth to grind.

Merrily, merrily, &c.

He will grind it at last, as grind it he must,  
And its brass and iron shall be clay and rust;  
But scatheless ages shall roll away,  
And nurture its fame in its form's decay.

Merrily, merrily, &c.

A new year dawns, and the old year's past,  
God send it a happy one like the last  
(A little more sun, and a little less rain,  
To save us from cough and rheumatic pain).

Merrily, merrily, &c.

God grant that its end this group may find  
In love and in harmony fondly joined;  
And that some of us fifty years hence once more  
May make the old telescope's echoes roar!

Merrily, merrily, let us all sing,

And make the old telescope rattle and ring!

Sciara da.

Primo, Son bevuto;  
Secondo, Son cantato;  
Intero, Son cucito.

Answer to the last:—

Be-lia-rio.

## LITERARY AND LEARNED.

### UNIVERSITY INTELLIGENCE.

OXFORD, April 2.—The following degrees were conferred:—

*Bachelor in Divinity, Grand Compendium.*—Rev. R. C. Willis, University College.

*Bachelors of Arts.*—Rev. F. W. Briggs, Magdalen Hall; R. Powell, Worcester College.

(Both incorporated from Trinity College, Dublin.)

CAMBRIDGE, April 2.—*The Chancellor's Medalists.*—The two gold medals for the best classical scholars among the commencing Bachelors of Arts of the present year, were on Monday last adjudged to A. C. Gooden, Trinity College, and W. S. Wood, St. John's College.

The following degrees were conferred:—*Bachelor in the Civil Law.*—G. J. Granville, Downing College.

*Bachelors in Physic.*—E. G. Jarvis, Trinity College. *Bachelors of Arts.*—A. Grant, G. B. Norman, D. W. Williams, Trinity College; C. A. Ralston, J. Romney, St. John's College; F. C. Bellis, Clare Hall; J. B. Swann, Trinity Hall; J. Till, C. Turner, Queen's College; Z. Nash, Catherine Hall; J. A. Ashley, Jesus College; C. H. G. Butson, W. S. Dawson, Magdalen College; J. Green, Emmanuel College.

A. J. Miller, M.A., Trinity College, Dublin, was admitted ad eundem.

### ROYAL ASIATIC SOCIETY.

APRIL 4. Professor Wilson in the chair.—The Secretary read a paper by Colonel J. A. Hodgson, of the Bengal Native Infantry, late Surveyor-General of India, 'On the Length

of the Illahae Guz, or Imperial Land-Measure of Hindustan.' The object of this paper was the fixing a standard measure of length for India, or rather the ascertaining what that standard was; and when so many expensive operations had been undertaken by the governments of Europe to fix standards for their respective countries, it cannot be necessary to expatiate on the value of such a measure in regard to our dominions in India, where a vast extent of territory and discordant population had united to render any thing like uniformity as yet utterly unattainable. The necessity for this inquiry was forced on the mind of the writer in 1821, when he was directed by the Bengal government to make surveys in the north-west provinces for revenue purposes. The Illahae guz—a standard measure ordained by the Mogul emperors—was the foundation of the land-measures of India, 3600 square guz composing the begah, the ordinary denomination for all land-measurements. But this standard had been lost, and very great discrepancy prevailed as to its length; and, consequently, to the extent of the begah; to the injury, either of government or of individuals, as it affects every settlement of land revenue, and every grant of land made by the sovereign, from the time of Akbar to the present. According to the "Ayeen Akberry," the old guz, for cloth measure, contained forty-six fingers, but for every other purpose only thirty-two; and Akbar, in the thirty-first year of his reign, in consideration of the ills resulting from a multiplicity of measures, ordered that in future the guz should be of forty-one fingers for every purpose, and called the Illahae (or divine) Guz. The first step of Colonel Hodgson was to obtain the average breadth of a man's finger in India, and he accordingly measured, with a pair of callipers, the hands of seventy-six natives, both across the knuckles and the middle joints of the fingers. The measures are given in detail, but we have to do only with the results: which were, that the average breadth of the hand of a native of Hindustan, at the knuckles, is 3.2287 inches; and at the middle joint, 3.078 inches; and that the length of the guz, on the supposition that the first mode is correct, will be 33.018 inches; and, on the second, 31.549 inches. It being generally understood in India, that six barleycorns make a finger, Mr. Halhed made very many measurements of barleycorns, in sets of thirty-six and seventy-two, with every precaution. The result of a measurement gave a guz of 31.843 inches. Another measurement was made of the breadth of a Meensoorie pice, of which forty-two are reckoned equal to a guz, and this gave a measure of 42.035 inches. Several attempts were made by other means, but in no case was there any considerable difference from these results. In the year 1824, Colonel Hodgson was furnished by Mr. Newnham with means to determine the length of the guz to perfect accuracy. This was a copy of the "Shah Jehan Nameh," a work containing an accurate description and detailed measurement of the imperial buildings at Agra; that is to say, the Taj Mahal, the Muti Mesjid, and the Juma Mesjid. At the end of the year 1825, Colonel Hodgson went to Agra, made a minute survey of these buildings (a plan of which was suspended in the Society's room), and was enabled from the accuracy with which the measures are given in the MS., and the perfect state of preservation of many portions of the buildings, to ascertain the length of the measure used: this he found to be 31.466 inches. The paper con-

cluded by a warm testimony to the beauty of the Taj Mahal—a building, in the opinion of Colonel Hodgson (which was corroborated by several members present), unequalled in the whole world. A model of this building, some time ago exhibited in England, gave but a very faint idea of its imposing beauty. The principal building is cased, within and without, with white marble; highly ornamented throughout with inlaid work; and its high finish has induced the comparison of a fairy palace built of pearl. "When seen through the long vista of stately trees which border the canal of fountains by which it is approached from the great gate, the mind is impressed with a sensation of solemn admiration, not awakened by any other work of men's hands."—The Seventeenth Anniversary of the Society was announced for the 9th of May.

### ROYAL SOCIETY OF LITERATURE.

FEB. 13.—At the meeting of this day, a memoir was read on the supposed sites of the ancient cities of Bethel and Ai. Though lying in the highroad from Nablous to Jerusalem, and within a short distance of the Holy City, the sites of these renowned places have been much neglected by travellers. According to Maundrell's account, which has been followed by more recent travellers, the spot on which Bethel stood is about seventeen and a half miles from Jerusalem. Mr. Cory, however, shewed, from the narrative of the destruction of Bethel and Ai, in the book of Joshua, compared with the nature of the country at Beyteen, a village only seven miles N. by E. of Jerusalem, with which that account is strictly in agreement, that it was upon this spot Bethel was, and that a hill in the vicinity, to the east, is the situation occupied by Ai. Jutting out into the valley which separated the two cities, is a hill on which Abraham is said (Gen. xii. 8) to have erected an altar. The distance of these sites from Jerusalem, and their position with respect to it, their close neighbourhood, their relative situation, the valley to the north of Ai, the place of ambush selected by Joshua, the intervening hill, and the quality of the soil, intermixed with fragments of pottery, and the rubbish of ruined walls, are among the particulars which confirm their identification.

### SOCIETY OF ANTIQUARIES.

MR. HUDSON GURNEY, V.P. in the chair.—Mr. Barnwell read the Auditors' report of the Treasurer's accounts for the last year. His grace the Duke of Beaufort, by Mr. Hooper, exhibited the original grant of the lordship of Gower, in Wales, to his grace's ancestor by Charles the Second,—the grant having on the face of it a portrait of King Charles.—Lieutenant B. Worthington exhibited two ancient guns, or chambers of guns, found at Dover, with a drawing of a similar gun taken up from the wreck of the Mary Rose, one of the war ships of Henry the Eighth.—Mr. Gurney exhibited an impression from an ancient seal in the possession of Mr. Delwyn, bearing the legend, "Sigillum commune Domus Beati Davidis de Swanzy."—Mr. Treher exhibited a drawing, accompanied by a description, of Culverhole, in the side of a hill in Gower, before mentioned.—Mr. Halliwell communicated some additional observations on a seal found at Cambridge, and exhibited at a former meeting.—Dr. Bromet, referring to some drawings of curious carvings, formerly at Halmaker House, lately shewn to the Society, now exhibited several drawings of the house itself, and the interior of the hall before it arrived at its present

state of complete ruin.—The reading of Mr. C. Roach Smith's account of Roman remains recently found at Strood, Upchurch, and other places in Kent, was concluded.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday*.—Medical and Chirurgical, 8½ P.M.; Civil Engineers, 8 P.M.; Zoological, 8 P.M.; Society of Arts (Illustration), 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.  
*Saturday*.—Westminster Medical, 8 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

ON this day there will be a private view of the Annual Exhibition of the New Society of Painters in Water-Colours, which will be opened to the public on Monday. We understand that her majesty the Queen Dowager, who is the patroness of the Society, yesterday honoured their gallery with a visit. We have ourselves been favoured with a glimpse of the collection; and, although the circumstances of the case compel us to delay entering into any details until our next publication, we are happy to say that we were most favourably impressed with the *tout ensemble*. The different members of the Society appear to have vied with each other in their efforts at excellence; and, hasty as our glance was, it sufficed to shew us that those efforts had been eminently successful. Among the works with which we were especially struck, and the merits of which we shall feel it our duty hereafter particularly to describe, are "The Canterbury Pilgrims, previous to their Departure," by E. Corbould; "Halt in the Desert," by Warren; "The Death of Titian," by Kearney; "Pilgrims waiting for Alms at the Gate of a Monastery," by Haghe; "Love Me, love my Dog," by Hicks; "Dutch Boats making for Harbour," by Duncan; "Rotterdam," by Howse; "Interior," by Weinart; and others by Weigall, Rivière, Johnson, Campion, Prout, jun., Rochard, Miss L. Corboux, &c. &c.

#### GRAPHIC SOCIETY.

THE members and visitors met numerously at this interesting Association on Wednesday last; the next, in May, will be the last of the session. The works of art placed before the visitors were less numerous than we have seen on other occasions, but they were of great interest. The chief attraction was Mr. David Roberts's sketches and drawings in Egypt, Nubia, Arabia, Syria, Palestine, &c. &c.,—scenes and subjects of the deepest interest and admirable selection: as works of art, it is enough to say that they were by David Roberts. Facsimiles of these beautiful drawings are about to be published by the spirited and indefatigable printseller Mr. Moon, of Threadneedle Street. We heard that they are to be published in parts, accompanied by letterpress descriptions from the pen of Dr. Croly: if so, one of the most beautiful and interesting works ever published may be expected; combining such talent, artistic and literary, for the illustrations of the sacred scenes of Holy Writ as rarely concur, and cannot fail of obtaining high and extensive patronage.—Upon the tables were placed many and beautiful specimens of Voltatype medals and coins; but a greater interest was excited by impressions from Voltatype plates by Mr. Collin. Upon the plate of a portrait of Byron, after Phillips, copper had been deposited by the new process, and thus formed the design

in relief; this afterwards became the mould from which other plates might be obtained *ad infinitum*. Impressions from the original plate and from the Voltatype plate were shewn, and it was impossible to detect a difference. Some proofs were also shewn of Haghe's forthcoming lithographic work, which Hodgson and Graves are about to publish; they are wonderful specimens of his skill and effect of his art.

*Picture of Prince Charles Edward and the Highlanders entering Edinburgh after the Battle of Preston-Pans.* Painted by Thomas Duncan, Esq. R.S.A.

WE have been favoured with a private view, at Mr. Moon's, of this very striking work; and it gives us great pleasure to say that, in our opinion, it does the highest credit to the artist (hitherto little known among us Southrons), and to the British school of art.

What a mighty

"Tamer of the human breast!"

is Time! Had this animated representation of the brief and delusive triumph of the unfortunate Stuart family made its appearance about ninety years ago, with what powerful and conflicting passions would it have been viewed by spectators of various principles and sentiments! But now, all the turbulent feelings of those days have subsided; the event has become merely an historical incident, and every body contemplates it with tranquillity, or, at most, only with the interest which the strange adventures and vicissitudes of an illustrious and unfortunate race, must naturally excite in every generous bosom.

Mr. Duncan has managed his composition with great skill. In the centre, mounted on a bay charger, and on his way along the Canon-gate to Holyrood House, advances the gallant Chevalier, unbonneted, arrayed in the tartan which is distinguished by the epithet of "royal," wearing the arms with which he had fought on the preceding day, and with a fine expression of conscious dignity in his noble countenance. He is supported on his right by the Duke of Perth, on his left by Lord George Murray, and is closely followed by the most distinguished chieftains and warriors of his army, clad in varieties of the national costume, the peculiar characteristics of all of which have evidently been attended to by the painter with scrupulous care. The spectators are massed on each side. The principal group on the one side is composed of the Marquess of Tullibardine, and a lovely galaxy of the ladies of his family, with other enthusiastic adherents of the Stuarts; among them Lochiel, a faithful portrait of Professor Wilson. The group of spectators on the other side chiefly consists of citizens of Edinburgh, and some Highlanders guarding a captured cannon; on an outside stair above whom stand Home, the author of "Douglas;" Maclaurin, the celebrated mathematician; the preacher of a Cameronian meeting-house, and several of his congregation; all adverse to the Stuart cause. Our limits compel us to notice only a few of the most prominent individuals; but the space is crowded with figures, all of more or less importance and interest, and therefore, to use the words of the printed description, "those who attempt to arrive at a knowledge of the picture at a glance will fail in their object: it must be read, and read leisurely, and will bear both reading and reflection." The light (a sunbeam) falls on the Chevalier and on the group to which we first adverted, and is strongly reflected from the latter on the group opposite; thereby giving Mr. Duncan the

opportunity of shewing that he is not afraid of encountering one of the greatest difficulties of the art, and that he is capable of painting every object with detailed distinctness, without injury to the general breadth. The picturesque old buildings of the Canon-gate, the Prison, the Regent Murray's House, the Ancient Cross, the Nether-bow Port, the Tron-gate Church Steeple, and in the extreme distance, a part of Edinburgh Castle, constitute the appropriate back-ground. Of the colouring throughout, we should say that it is of a good historical tone. If it err at all, it is on the safe side of sobriety, which is certainly much preferable to garish meretriciousness of hue.

This admirable performance was painted for Mr. Alexander Hill, the publisher, of Edinburgh, and is about to be engraved in line. We trust that one of our ablest artists will be selected for the undertaking.

#### THE FRENCH SCHOOL OF ART.

*The Louvre: Salon of 1840.*

[Third Notice.]

THE chief of French historical painters now living, Horace Vernet, has no productions whatever, as we have before had occasion to remark, in this year's Exhibition: he has been much employed on foreign commissions, on works for Versailles, and in travelling in the East, so that we have nothing more to do than to enter his name *pour mémoire*. Paul Delaroche too—we do not know from what cause precisely, but we believe from the importance of some private commissions—does not appear on the list of exhibitors. Two great names like these are difficult to be replaced; and when we add to them that of Ary Scheffer, also a defaulter, we may say that the historical department is hardly at all represented this year in the Louvre. The great exception is that of M. Couder, who, though already of very high reputation, which he has justly earned, has sent in a large picture of a very exalted order of merit, for which perhaps his warmest friends had hardly given him credit. The subject is the "Opening of the States-General at Versailles in 1789;" and, though enough to inspire any one with the momentous importance of the event, becomes a very difficult one to treat with strict historic truth. The artist has acquitted himself with the greatest ability: the spectator is supposed to be placed a little to the side and rear of the deputies of the *Tiers Etat*, looking diagonally athwart the hall to the throne and platform, on which the king, the queen, the royal family, great officers of state, &c. are seated: in front of the picture, to the right of the ideal spectator, sit the order of nobles, and behind them are the galleries, filled with ladies; to his left-hand, and in the left corner of the foreground, are the clergy; the right of the foreground represents the *backs* of the heads of the *Tiers Etat*: in the middle are the tables of the secretaries, and Necker standing up reading the ordinance for the opening of the States. All the principal figures are portraits, and, with the exception of Louis XVI., are faithful likenesses of the personages they represent: the whole composition is grand, solemn, and yet perfectly easy and natural; simply for this reason, that the artist has adhered strictly to historic truth. His great skill is appreciated only by an examination of some of the minor details: Mirabeau is standing up among the deputies, turning round and addressing one of his colleagues; his figure is uncommonly spirited: Bailly is in the immediate foreground: in fact, all the great men of that period of the Revolution are in the picture. There are per-

haps sixty or seventy of the nobles represented sitting, all in the same costume; but the position of no two is the same! they are models of ease and elegance. There is a group of seventy or eighty wigs—nothing but powdered wigs,—no faces! representing the heads of the deputies; they are all admirably painted! The difficulty of treating such a subject is immense, as any artist knows well; and we do not hesitate to say that we have no painter in England who could at all come near such a production as this, whether for composition or for what we fail so much in at home—drawing. We ought to add, that the dimensions of this picture are very large, about twenty-five feet by ten feet: it is intended for one of the new galleries at Versailles, and is the property of the crown. The next picture of the historical school that deserves notice is an ideal composition by M. Eugène Delacroix, entitled “The Justice of Trajan.” It is an upright picture, of sufficiently large dimensions to allow of the figures in the foreground being of the size of life: the emperor, in the midst of a train of soldiers, is issuing on horseback from beneath a triumphal arch, and is turning round the corner of it. In advance are the standard-bearers and the blowers of the *litui*. A poor woman, whose son has just been put to death unjustly, throws the child under the feet of the emperor’s horse, and kneels over it, stretching out her hands to demand justice. Some of the attendants are about to remove her, but the horse rears up, and the emperor makes a motion with his hand to keep back the press that he may listen to her complaint. The subject is a good one, and M. Delacroix has treated it with abundance of *verve*: he has rather crowded his figures too much, and the drawing of parts of the horse, as well as of the mother and child, is certainly defective; but the colouring of the piece is very splendid. The *chiaroscuro* is sufficient to give plenty of strength without making it dark, and the handling firm and vigorous in the highest degree. This gentleman takes as his masters Paul Veronese and Rubens, inclining rather to the colouring of the former than of the latter: thus he is fond of introducing the peculiar greenish-blues which Paul Veronese so often employed in his draperies, while, on the other hand, he treats his flesh quite with the warmth and vigour of the great Flemish painter. As he is a young man (by the way, he is a good poet and musician), and as he is one of the most original and adventurous painters of the day, he has, of course, an unusual number of detractors and enemies. Two years ago he painted a magnificent picture of “Medea about to Kill her Children,” which attracted universal admiration. Last year he did not send much to the *salon*; and what he did send was not so good as it ought to have been: but his production this year is full of power, and displays all the characteristics of a future great man. Whatever may be its defects, it has got plenty of the “divine mind” in it; and it is what very few artists could imitate. We have already mentioned M. Delacroix as one of the principal colourists of the French historical school; and we think he bids fair to attain great eminence in this line throughout Europe.

The other historical paintings of this year by French artists are not good enough to render any specific notice of them interesting to a reader who has not seen them: there are many canvasses of promise, and many that contain parts of value. We may say the same of the sacred pictures; for we have not seen one that we consider a good one—a really good and

notable picture, that is to say—in the whole *salon*, unless we make an exception of a Crucifixion by M. Gué, on the John Martin principle, with Jerusalem towering up in the distance like Pelion upon Ossa, or rather like Rome upon Babylon, and with some 30,000 figures, more or less, within the limits of the frame. M. Gué has adopted the idea of some old Italian painters, and has made the sky all angels,—nothing but heads and wings: the effect, though bizarre, is very good, for he has applied some powerful colouring; and he has shewn that he has got a good deal of imagination at the end of his brush.

Several foreign artists have this year sent their contributions to Paris. Among them is one by M. Keyser, of Brussels, a young man in his twenty-sixth year, “The Battle of Wœringen,” an action gained in 1288 by John I., duke of Brabant, over the Archbishop of Cologne and the Counts of Guelderland and Luxemburg. It is an enormous affair, forty feet by fifteen feet at least; and it is neither badly drawn nor badly coloured, but it is badly composed: it is stiff and theatrical, and as unlike a battle as any of the Versailles series that can be named. It is, however, looked upon at Brussels as a *chef d’œuvre*; while in reality it adds only another to the many proofs which are already extant of the Belgians being nothing but indifferent imitators of the French, and as such widely erring from the true end and intention of painting. We apply the same remark to all the other works by Belgian artists in this year’s *salon*: they are all very weak and second-rate performances, evidently mere imitations of various Gallic masters. This is a great pity, for in former days Belgium possessed an original and immortal school; and the sooner she learns to rely on her own powers again the better. The best painter of the Belgian school, M. Gallait (who, however, is more of a French than a Belgian artist, and lives and studies entirely at Paris), is at present in Italy on a tour of health; and his large production, “The Abdication of Charles V.” remains on the easel in his *atelier*.

It is but rarely that any British artist not resident in Paris sends any thing to the annual exhibition at the Louvre—a circumstance that we deeply lament, because the generality of the French artistical world, and the crowd of *soldisant* connoisseurs, moving seldom out of the limits of *la belle France*, know nothing of the nature and merits of the British school, of which they have seen so few specimens. The consequence is, that much unjust and prejudiced feeling prevails on this topic; and the friendly intercourse that ought to be maintained between the schools of art of two neighbouring nations, cannot as yet be said to have any existence. When, therefore, a British artist does appear in the catalogue of the Louvre, he is visited with a double portion of criticism; and the French public, so strongly prejudiced as it is, attributes at once to the whole English school any defects that they may chance to find in his performance. Under such circumstances it is most desirable that none but first-rate productions of the British school should be sent over here; in fact, nothing under a Maclise, a Landseer, a Stanfield, a Roberts, &c. One very large picture, this year, is far from what could be desired in this respect; and it will be the patriotic duty of some of our great painters to send over half-a-dozen first-rate pictures next year, just to disabuse the French public, and to let our Gallic rivals know what the power of a British brush, and the harmony of a British palette, can effect.

Next to what are historical pictures, properly so called, come the *tableaux de genre*, and the smaller class of ideal historical compositions, as well as the battle-pieces. The artist who has most distinguished himself this year among those who have treated historical subjects on a cabinet scale is Robert Fleury, and he has got several admirable productions in the Exhibition. One is the representation of the conference between the Catholic and Protestant divines at Poissy, near Paris, in 1561, in the presence of Catherine de Medicis and Charles IX. Beza, as is well known, conducted the arguments on behalf of the Protestants on this occasion, and the painter has seized the moment when an animated dialogue is going on between him and a monk. The cadaverous visage of the latter, who looks as if he had been disinterred for the occasion, the quiet dignity of Beza, the crafty mien of the boyish sovereign, and the haughty aspect of his mother, are admirably rendered. The composition is skillfully arranged, and the colouring is very rich and harmonious. It is a picture that has excited general approbation. The same artist has another, and we think a better one, “The Death of Ramus,” in another part of the gallery. This learned professor fell a victim to the fury of the Catholics during the massacre of St. Bartholomew, in 1572, and allowed himself to be surprised in his room, where he was found with one of his scholars studying Greek. M. Fleury has represented the old man in a small dark room of his college, in the Rue St. Jean de Beauvais, sitting upright on a mattress partially covered with a blanket, his Greek books all around him, and his young companion listening at the door as the murderers are ascending the stair-case. Ramus has his hands joined in prayer; but his blood-shot eye, half turned round towards the door, reveals the terrible apprehensions of his mind. This picture is without any pretensions of aid from a needless display of furniture or other objects of still life; the old man and the boy have all the canvases to themselves, and they speak volumes; it is a *morceau* which would not have disgraced Rembrandt himself. A third picture of M. Fleury’s, “A Miser counting his Gold,” though not equal to the other two, is full of excellent qualities. They are all three beautiful cabinet pictures, and would be an honour to any collection.

#### THE DRAMA.

*Her Majesty’s Theatre*.—On Tuesday, Mlle. E. Tosi made her *début* in the opera of *Norma*. She has a prepossessing appearance; but timidity, perhaps, rendered her vocal exertions less successful than was to be expected from her position in the opera.

*Covent Garden*.—C. Kemble seems to grow more buoyant as part succeeds to part; though *Charles Surface* is a more level character than *Don Felix*, and only susceptible of the high comic polish with which he adorned it, rather than the variety and occasional flashing of the latter. Of his *Benedick* we cannot speak with the accuracy we could wish, being only able to secure a lofty and distant corner whence to behold it. As well as we could see, he was quite the Kemble of former days. His bounding off the stage with Mrs. Nisbett, his spirit in delivering the last two lines, and the celebrated arbour-scene, where his gestures are so expressive, were all the perfection of Comedy. Nor should we omit to notice the fine tone in which he gave the sentence, “You have killed a sweet lady, and her death shall fall heavy on you;” and nearly the same words in the same

scene, pathetically addressed to the prince, with Claudio, "My lord, for your many courtesies," &c. &c., than which nothing could be more touching. Mrs. Nisbett appeared to be a lively and arch *Beatrice* in the gayer portions of the play, and looked charmingly; but in the feeling scenes neither her voice nor manner were so effective as they might have been. As far as vivacity went it was a very clever and agreeable performance, but not such a hit as the *Violante*. Miss E. Montague made a sweet and modest *Hero*, and no more is required. Farren was, we think, too *cute* as *Dogberry*, but extremely laughable; whilst Keeley, in *Verges*, looked delightfully droll, and acted and said his little bit as he looked. Of Vandenhoff's *Claudio* we cannot speak in praise; it was cold and heavy. On the other hand, Mr. Diddar was an excellent *Leonato*, and, with Bartley's equally good *Antonio*, gave the quarrel-scene in the fifth act greater interest than it has usually had the luck to possess. "Sigh no more, Ladies," was prettily sung by Binge, S. Jones, Healey, Mrs. E. Knight, and Miss Wilkinson; and the whole was a treat worthy of the best days of the drama.

Last night, *Hamlet* was announced as Kemble's last night, but we hope there will be many last nights after that. The theatre crowded every night he performs speaks the public voice and general desire too unequivocally to be misinterpreted. He left the stage too soon, and for the sake of the stage he ought to return to it again, at least for a while. After what we have seen, we should be really unhappy if we did not see his *Young Mirabel* (among others of his best characters) once more; and we trust he will be induced to gratify the lovers of the drama with a series of representations, such as he alone can set before them. At the Haymarket we have tragedy, and humour, and farce of the highest order, and it will be most acceptable to have the variety of genteel comedy at Covent Garden.

*Olympia*.—A trifle, called *Legacy Hunting*, was on Wednesday added to the pleasant varieties at this theatre. It serves to while away the noisy half hour before the places are filled up by the many first parties, second parties, and so on, who are attracted by the *Ladies' Club*. The work is equally divided among the characters, and the whole fairly played. The old soldier-servant of Mr. Turnour, although he has not a dozen lines to speak, is an excellent bit of acting, and could not be better done.

#### VARIETIES.

*The Landers*.—It affords us great satisfaction to be able to state that Lord Melbourne has granted a pension to the widow and children (three) of the late John Lander. That amiable and very intelligent individual had indeed a strong claim on the country; for, like his brother Richard, though not in actual service on the spot, he too was a sacrifice to that spirit of African enterprise which has identified the name of *Lander* with the history, and, we trust, the civilisation, of that continent. It is a credit to the minister that he has thus acknowledged, though we believe, of necessity, in a lesser degree than might have been hoped, the debt of gratitude due to the intrepid explorers of the Niger and the interior of Africa, so fatal to European life.

*The late W. Hilton*.—A subscription has been opened by a number of artists and amateurs, for the purchase of the late highly-esteemed Keeper's picture from Spenser, of Sir

Calepine rescuing *Serena*, to be placed in the National Gallery as a tribute to his memory. Only five hundred guineas are requisite for this desirable object, and sure we are that the admirers of worth and genius need only be aware of the fact to ensure the speedy accomplishment of the proposition. The picture itself remains at the late residence of the artist in the Royal Academy.

*College for Civil Engineers*.—The Council for this Institution have elected the following professors in their institution:—*Mechanics*, Mr. R. Wallace, M.A. *Mathematics*, Mr. O. Burne and Mr. A. W. Horneman, B.A. Cantab. *Civil Architecture and General Construction*, Mr. J. Elmes, Architect, C.E. *Naval Architecture*, Mr. J. Waterman, of the Admiralty. *Physics*, Mr. H. Lewis, M.A. Cantab. *Chemistry*, Mr. T. Everett, Professor of Chemistry, Middlesex Hospital. *Mineralogy and Geology*, Mr. T. Webster, F.G.S. *Statistics*, Mr. C. Taylor, LL.D. Trinity College, Dublin. *French Language and Literature*, M. Lucien de Rudelle, M.A. University, Paris. *German*, Dr. Strömeyer, University, Wurtzburg. *Greek and Latin*, the Rev. J. R. Page, M.A. Cantab., Resident Chaplain to the College. *Secretary*, Mr. J. E. B. Curtis.—*The Times*.

*The Duke of Wellington*.—The subscription for a memorial to the Duke of Wellington at Glasgow amounts already to above 8500*l*.

*Caricatures*.—H. B. another three. They are all full of figures and full of fun. No. 631. "The Beggar's Petition." O'Connell as an old woman, with a plentiful progeny of shoeless brats, is begging for "a free trade" from Lord Morpeth, who is dropping a bill for the Suppression of Mendicancy in Ireland, "the unkindest cut of all;"—a bag marked *rint* peeps from under the cloak. 632. "Comus and the Lady," a mask, is very spirited. The poor frightened lady (our gracious Queen) is beset by Lord Melbourne, backed by other ministers, presenting a cup inscribed "War;" and on the other side are Owen, Hume, O'Connell, and a satyr, &c., pressing forward with Socialism, Repeal, and Chartism. The grouping is admirable, and the likenesses very striking. The last, 633, is one of the artist's favourite coach-pieces, "An Omnibus Race." Lord Stanley driving John Bull in the "Dilly Association," with Burdett, Sir J. Graham, &c. on the front, whilst O'Connell is lashing up the "St. Giles," with Lords J. Russell and Morpeth as the hacks, and Lord Melbourne, &c. behind him, the premier holding on with alarm and difficulty. At the window, Prince Albert is *vis-à-vis* to the Queen's bonnet, and says, "You drive very furiously in this country. Don't you feel alarmed?" To which the bonnet replies, "Oh, not at all. We are used to it." The whole are well-worthy of the set to which they have added their political humours and artist-like execution.

*Mr. Healy*.—We are gratified to hear from Paris that this young and rising American artist, whose productions in our last year's Exhibition obtained the meed of high praise from us, had the honour of a sitting from the King of the French on Tuesday week. We are certain he will make a striking and characteristic likeness of his majesty.

*Music*.—H. R. H. Prince Albert has consented to become a director of the Ancient Concerts; this act of condescension on the part of his royal highness has created a strong feeling of gratitude throughout the profession.—*Musical Journal*, No. XIV.

*Advantages in opening Public Places for the People*. From the *Official Returns*.—Compara-

tive number of admissions to the Armories of the Tower during ten months of 1837, at two shillings each visitor; in a similar period of 1838, at one shilling; and in ten months of 1839, at sixpence. (The full amount for each year, including the two months omitted, would be about one-tenth more.)

	P.	s.	d.
In 1837 .. 9,508 visitors at two shillings ..	300	16	0
1838 .. 37,431 .. at one shilling ..	1871	11	0
1839 .. 70,173 .. at sixpence ..	1732	16	0

The regulation for half-hourly admission under the care of a warder necessarily checks the further increase.

The keeper of the jewels has greatly benefited by the increase of visitors to the armories, although no reduction has yet been made on the two-shilling charge (besides warder's fee) at the jewel-room, as the following returns shew:—

	£.	s.	d.
In 1836, the amount received for the exhibition of the crown jewels was ..	546	0	0
1837, ditto ..	541	11	8
1838, (when reduction of charge at the armories commenced) ..	1293	16	8
1839, with the further reduction at the armory ..	1405	19	10

*Mr. Jeffreys' Respirator*.—The numerous testimonials in favour of this instrument are so strong, that we must have faith in its highly conservative principle. For invalids to whom the breathing of cold air is injurious, and generally we would say for night travelling, it seems to afford great protection to the lungs, and a safeguard against complaints in the chest.

*Whimsical Errors*.—The patent creating Lady Cecilia Underwood *Duchess* of Inverness, gives the same title to her *heirs male*, and reminds us of the erratum, "For *her grace* the *Duke* of S—, in our last, read, his *grace* the *Duchess* of S—." In "The Times" of Monday, Mr. G. H. Vernon, M.P., correcting a mis-report of his name as Mr. V. Harcourt, concludes thus, "My name is *Your Obedient Servant* G. H. Vernon."

#### LITERARY NOVELTIES.

In the Press.

A New Edition of Burnet on The Pastoral Care, revised by a Member of the University of Cambridge; with an Introductory Preface by the Rev. Thomas Dale, M.A.

#### LIST OF NEW BOOKS.

Rivers, jun. 3*d* edition, greatly enlarged, fcap, 6*s*.—*Ezra*; a Sacred Poem, by H. T. Thomson, in three cantos, 2*s*. each.—Mrs. Arbutnot's Guide to the Scriptures, 2*d* edition, fcap, 3*s*. 6*d*.—The Victory of Faith, and other Sermons, by the Rev. J. C. Hare, 8vo. 10*s*. 6*d*.—Rev. A. Dallas's Cottager's Guide to the New Testament, Vol. III. 12mo. 3*s*. 6*d*.—C. T. Downing's Fanciful in China, 2*d* edition, 3 vols. post 8vo. 2*l*s.—The Voice of Conscience; a Narrative, by Mrs. Q. Kennedy, post 8vo. 7*s*. 6*d*.—*Cordelia*; a Tale of Conscience, by G. Lowther, 3 vols. post 8vo. 16*s*.—The Pre-Millennial Advent, by the Rev. W. Burgh, 12mo. 2*s*. 6*d*.—An Offering to Invalids (Prayers, &c.), 12mo. 1*l*. 6*d*.—Milton's Paradise Lost, with Notes by J. Prendergill, 8vo. 12*s*.—Dr. G. Signmond and Dr. F. Farrer on the Ceylon Moss, post 8vo. 2*s*. 6*d*.—The History of Spain and Portugal, by Miss J. Corner, 12mo. 2*s*. 6*d*.—The Tourist's Guide from London to Paris, by J. Tourrier, 18mo. 2*s*. 6*d*.—Arundel; a Tale of the French Revolution, by Sir F. Vincent, 3 vols. post 8vo. 1*l*. 1*l*s. 6*d*.—*Tales of the Kings of England*, by S. Percy, 16mo. 4*s*. 6*d*.—W. Marshall's Collection of Anthems, fcap, 2*s*. 6*d*.—The Old Paths, by the Rev. J. B. Pratt, 12mo. 5*s*.—Liturgia Domestica, 12mo. 3*s*.; or, with Psalms, 4*s*.—Felix de Lisle, an Autobiography, fcap, 4*s*. 6*d*.—The Church in the World, fcap, 2*s*. 6*d*.

#### TO CORRESPONDENTS.

We are obliged to Enquirer (Ryde) for pointing out to us "Though Bacchus may boast," and "There's a difference in fact," as beautiful songs of Captain Morris's, which we did not notice; but he must be aware that we could not particularly all his charming compositions.

M. Guizot's "History of the English Revolution" was reviewed in our No. 1152.

We are obliged to E. B. M. G. S. &c. &c., but we must not have too much even of a good thing.

## ADVERTISEMENTS.

London: Black and Armstrong, 9 Wellington Street, Strand.

## NEW ZEALAND.

In 2 vols. post 8vo. with Ninety Woodcuts and Map, price 16s.

## MANNERS and CUSTOMS OF THE NEW

ZEALANDERS. With Notes corroborative of their

Habits, Usages, &amp;c., and Remarks to Intending Emigrants.

By J. S. POLACK, Esq.

Author of "Travels and Adventures in New Zealand." 1831-7.

"Mr. Polack's interesting and instructive volumes appear most

opportune, conveying, as they do, a great variety of minute in-

formation, drawn from actual observation, personal investigation

on the spot, and experience considerably prolonged, concerning

the Manners, Customs, and Ceremonies of the New Zealanders.

His narrative is clear and spirited, his descriptions picturesque,

and his reflections sensible and moderate."—*Monthly Review*,

April.

"The well-illustrated volumes before us afford ample scope

for reflection on the manners and usages of semi-barbarous life,

and on the peculiar customs and ideas of the New Zealanders."—

*Colonial Magazine*.

"His book is both interesting and useful,—interesting to all

classes of readers, for the amusement it affords; and to Emi-

grants, or to those who are debating whether or not they shall

become such, almost indispensable, if they desire to form a fair

comparative estimate of the various spots which put forth claims

for their attention at the present moment."—*New Monthly*, April.

"After perusing these two volumes carefully, and finding them

abounding in instruction and amusement, it is impossible to do

justice to such a work in the space we can at present accord to it.

Mr. Polack's book is an addition to literature; it appears to be

written in a frank spirit, and all the statements are made care-

fully."—*Sunday Times*, March 28.

James Madden and Co. Successors to Peabody and Co.

8 Leadenhall Street.

Price 2s. 6d.

cloth.

3. The Dramatic Works of Shakspeare.

Price 16s. cloth.

Edward Moxon, Dover Street.

**OTHURIEL and other POEMS.**  
By THOMAS AIRD, Editor of the "Dumfries Herald."  
This is no common book. We do not recollect any volume of poetry, published within the last ten years, possessing higher claims to attention. Its chief strength lies in its descriptive passages. These are, for the most part, of unusual splendour and originality.  
Edinburgh: William Whyte and Co.; London, Longman and Co.

**FRENCH, GERMAN, ITALIAN, SPANISH, AND PORTUGUESE—TO FAMILIES AND SCHOOLS.**  
**DE PORQUET'S NEW WORKS:—**  
Conversations Parisiennes, 3s. 6d. Histoire de France, ditte d'Angleterre, descriptes pour les Enfants, avec Carte, Portrait, &c. 4s. 6d. Le Trésor de l'Écolier; ditto for German, Italian and Latin, Spanish and Portuguese, 3s. 6d. each. Parisian Grammar, 3s. 6d. First French, Italian, and German Reading-Books, 3s. 6d. each. Parisian Spelling, 2s. 6d.  
"The method Mr. F. de Porquet has adopted in the teaching of languages is borne out by the first metaphysical minds."—*Educational Magazine*.  
11 Tavistock Street, Covent Garden; and all Booksellers.

**MRS. TROLLOPE'S WIDOW MARRIED.** A Sequel to "Widow Barnaby."  
Opinions of the Press.  
"A most excellent sequel to 'Widow Barnaby.' The illustrations are most admirably executed by one of the most ingenious and humorous artists extant."—*John Bull*.  
"We look upon the 'Widow Married' as one of the best and truest portraits in the whole range of modern fiction."—*Sun*.  
"Decidedly the most amusing of all Mrs. Trollope's stories."—*Parthenon*.  
"This sparkling, amusing, and most instructive work stamps Mrs. Trollope as a first-rate artist in this walk of literature. The sketches, by Buss, are capital."—*Caledonian Mercury*.  
"This capital continuation of 'Widow Barnaby' is rich in amusement and drollery."—*Dublin Evening Post*.  
"A most biting, observant, and humorous work."—*Age*.  
"The 'Widow Married' displays a deep knowledge of human nature. It is the best production of this highly gifted writer."—*Dublin Evening Packet*.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

**DE FOE'S MEMOIRS OF A CAVALIER.**  
In 1 vol. duodecimo, price 5s. in cloth.  
**THE MEMOIRS OF A CAVALIER; or, a Military Journal of the Wars in Germany and the Wars in England, from the Year 1632 to the Year 1648; forming Vol. VI. of 'The Novels and Miscellaneous Works of Daniel Defoe.'**  
\* \* \* A Volume of this Work will be regularly published every month, until the whole is completed in Eighteen Volumes.  
Oxford: Printed by D. A. Talboys, for Thomas Tegg, Chesham, London.

**NAVAL ARCHITECTURE AND STEAM NAVIGATION.**  
In 12mo. price 4s.  
**ON THE CONSTRUCTION OF THE ARK,**  
as adapted to the Naval Architecture of the present Day; and on the Equipments of Vessels; and on Steam Navigation to India.  
By W. RADFORD, Esq. R.N.  
Published by John Weale, 59 High Holborn.

**THE EDINBURGH REVIEW, No. 143,**  
is published this day.  
Contents:—  
1. Life and Writings of Sir Walter Raleigh.  
2. Scrope on Deer-Stalking—the Highland Forests.  
3. British and American Navies—James and Cooper.  
4. Walpole and Bolingbroke.  
5. The late Mrs. Boddington's Poems.  
6. Works of the Author of "The Natural History of Enthusiasm."  
7. Captain Osborne's Court and Camp of Runjeet Sing.  
8. Present State and Conduct of Parties.  
London: Longman and Co. Edinburgh: A. and C. Black.

**NAVAL AND MILITARY COMMISSION.**  
**THE SUPPLEMENT TO THE UNITED SERVICE JOURNAL** for April, published this day, contains the entire Report of the Naval and Military Commission on the subject of Promotion and Retirement. It comprises One Hundred Pages, price 2s.  
Henry Colburn, Publisher, 13 Great Marlborough Street.  
Orders received by all Booksellers.

**Rev. C. Girdlestone's Commentary on the Bible.**  
In 8vo. price 9s. boards, the Fifth Part (containing Job and the Psalms, i.—lxxx.), of  
**THE OLD TESTAMENT, with a Commentary, consisting of Short Lectures for the daily Use of Families.**  
By the Rev. CHARLES GIRDLESTONE, M.A.  
Rector of Alderley, Cheshire.  
In this edition of the Holy Bible, it has been the chief object of the Editor to furnish families with an exposition for daily reading. The Scripture is divided into paragraphs of a convenient length, and the explanatory and practical matter is digested, under each portion, into one consecutive lecture, so as to demand of the reader no previous study or attention.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.

Also, lately published,  
**Volume the First (containing the Pentateuch), price 18s.; and**  
**Volume the Second (Historical Books), 18s.;**  
or in Parts, at 9s. each.  
And, by the same Author,  
**The New Testament, with a Commentary.**  
In 2 vols. or Four Parts, price 11. 10s.

In small 8vo. price 7s. boards,  
**THE CHURCH OF THE FATHERS.**  
(Reprinted from the "British Magazine," with Additions.)  
By the Rev. JOHN HENRY NEWMAN, M.A.  
Vicar of St. Mary the Virgin's, Oxford; and Fellow of  
Oriel College.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 8vo. price 1s. the Eighth Series of  
**PLAIN SERMONS.**  
By Contributors to the "Tracts for the Times."  
Rivingtons, St. Paul's Churchyard, and Waterloo Place;  
and J. H. Parker, Oxford.  
Lately published,  
**The First Volume, price 6s. 6d.**

**RIVINGTONS' MINIATURE EDITIONS.**  
**BISHOP WILSON'S INTRODUCTION**  
TO THE HOLY SACRAMENT, with the Communion Service annexed. With Portrait.

### REVIEWS OF NEW BOOKS.

*Woman and her Master.* By Lady Morgan. 2 vols. 12mo. London, 1840. Colburn.

SUCH is the title of Lady Morgan's new work, or rather the first half of it, for other two volumes are promised as a sequel. "The Master and his Woman," she quotes Blackstone in her epigraph as being synonymous, but, in reality, the Man and his Mistress might have been the name with quite as much applicability to the contents. The book itself is a clever and smartly written review of the condition of the female in relation to the male sex, as far as histories have recorded the circumstances; and, starting with the creation, treats of their estate among uncivilised barbarians, the people of eastern countries, the Hebrews, the Grecians, and the Romans. The conclusion of all is thus given:—

"In the fourth century (the grave of the old world and the cradle of the new) the story of the women of antiquity draws to its conclusion, and makes way for the greater history of the women of the middle ages. Throughout the long and varied series of events so rapidly sketched in these pages, the evidence to character in behalf of woman is uniform. That she has reflected many of the vices of her master, through outraged feelings and the influence of a false position, is no derogation from the general truth. This was but the accident of her career; her spiritual and affectionate activity in humanising society, in averting evil, and promoting good, was the immediate law of her peculiar organisation, and constant as its cause. To limit and pervert this agency has been the great object of the social and legal institutions of imperfect civilisation: to give a full development to the design of Nature, by better arrangements, will be the crowning labour of man's earthly warfare, his triumph over himself."

The means, we presume, are to be pointed out in the next two volumes, where all these *a posteriori* statements and views are to be brought to bear on the grand desideratum of raising women in the scale of polity and humanity.

At present it is not very clear to us, from Lady Morgan's lucubrations, what it is they want. It seems rather to be a complaint against the ways by which they attain their influence and power in social life, than an assertion that they do not possess both. But they must not (it would appear) accomplish their ends, or the ends of their being, through the good feelings, the passions, the sympathies of men,—through filial reverence, brotherly affection, the fathers' fondness, and the husbands' love. No, they must be exalted and placed on some imaginary equality, by some fantastic cultivation of intellect, some gymnastics of the mind, which, like those for the body, are to strengthen its weakness and develop its forces. The whole history in these volumes is an argument against the theories they maintain; for from Semiramis and Cleopatra, Sarah, Rachel, Deborah, Bathsheba, and the Queen of Sheba, to Cornelia, Portia, Zenobia, Constantia, and Helena, we see nothing but women most distinguished, most elevated, most potential, the rulers of man

and of the world; not to speak of the worshipped in every clime as goddesses, with divine attributes and rites. To such proofs of their actual degradation, their ardent advocate adds others of their possession of superior natures, though she humbly professes that "nothing more is arrogated for the female than is admitted by all writers on physiology; a greater mobility of fibre, dependent on the softer constitution of her structure,—a more rapid and delicate sensibility, and a wider range of sympathies, corresponding in variety and in intensity with the exalted vital character of the general organisation."

It is, however, allowed also, that a "careful examination will show that the intellectual, like the bodily peculiarities of sex, are complimentary, and that, in respect to these also, the dependence of each sex on the other is mutual. There are occasions in life in which the promptitude of female apprehension is in especial request; there are others in which the slower and more syllogistic reaction of the male is preferable. The prevailing habit, also, of forethought, and the consequent postponement of present to future objects, arising out of the maternal feelings, forms a decided contrast to the more impetuous and self-willed indulgence in impulse, peculiar to man, and is calculated to act beneficially on the destinies of the species. The perfection of human reason and of human action, it is therefore assumed, is a middle term, resulting from a just development and mutual influence of the two sexes; and wherever either the agency of the one or the other is misdirected or rejected, civilisation must necessarily suffer. By placing in prominent relief the differences which distinguish the attributes of the sexes, and keeping out of sight what is common to both, it is not difficult to draw a fanciful line between their respective duties and destinies in society; and this is what the world has hitherto done to the disadvantage of woman. Mary Wollstonecraft, and some others, by reversing the process, have arrived at an opposite conclusion, equally false, if not equally injurious. It is, however, an undeniable truth, that there is a common nature, a common humanity in the male and female, much more influential than any differences assignable to the respective organisations: both sexes are, in the aggregate, organisations, built upon a common principle, and governed by common laws. For the far greater part, they are moved by common desires, and subjected to common necessities. Their rights in all these respects are therefore equal; their claims to protection before the law, for property and person, equal; their claims to a full development of their intelligence, by education (each according to its own faculties), equal. The author of these volumes, in advocating the cause of women, has no desire of 'railing the seal off the bond' of nature, and remoulding both sexes into one androgynous political identity. Still less does she see the emancipation of woman in any exemption from that holiest law of nature, which has been justly ranked as forming, with property, the two great foundations of society. On the contrary, she holds the sacro-sanctity of wedlock to be the only possible foundation

for common justice to the 'weaker sex,' and for rational happiness and security to 'the stronger.'"

The rationality of these remarks, however questionable, partially or in degree, would prevent us, were we otherwise inclined, from broaching the interminable argument about sexual equalities. In our opinion, Nature has settled the main points, and all the rest are accidental trifles,—leather and prunella. If we look around us in our own country, we see nothing which women have a right to lament as grievances. God knows there is too much of toil and suffering for both sexes; but surely men have their full share of the evil as women have of the good. By the low, debased, and brutal, they may be maltreated and oppressed, but in such cases the wronged are of the same qualities with their tyrants, and these tyrants are almost universally creatures whose lives are unvisited by enjoyments. Among the better classes the condition of woman in England is less burdened and more fortunate than that of man, upon whom all the charge of provision rests, and whose paramount object is to protect and cherish the sex, which, from physical causes, is less fit to struggle with the vicissitudes of worldly enterprise. Cannot woman be satisfied with the knowledge how inexpressibly dear she is to all who deserve the name of man, and submit to some slight reliance, we will not say dependence, on his loving cares? Cannot she be contented with her lot, and happy without an ideal sameness, which is alike forbidden by the constitution of her frame and faculties? Lady Morgan's version of the creation is a whimsical example of the ingenious sophistry by which an opposite hypothesis may be bolstered up.

"The Mosaic history (*she says*) of the creation assigns to the East the first scene of human existence, and places the first pair, created in perfect equality, in a paradise, which

"Of God the garden was,

By him in the east of Eden planted."

"For God created man in his own image, male and female created he him," 'to be a mate and a help to each other.' To the male, to Adam, it appears, was assigned a first task of corporeal performance; for 'he was put into the garden to dress and keep it.' To the female, Eve, was permitted the first exercise of mind, in the call made on her intellect by one who (whether considered as a 'fallen spirit, second only to the first,' or as a 'creature more subtle than any beast of the field, which the Lord had made,') sought to influence human action by intellectual means, though for evil purposes. The selection of the female for the experiment of a superhuman sophistry indicated on her part a difficulty rather than a facility to be won over; and the reward offered, for risking the awful penalty of death 'by disobedience,' was no less than that 'she should be as are the gods, knowing good from evil!' The woman ('seeing that the tree was to be desired, to make one wise,') took the fruit accordingly thereof and did eat.' The man only followed the example of the woman: and 'The woman thou gavest to be with me, she gave me of the tree and I did eat,' was the

weak and reproachful answer of Adam to the interrogation of his Creator. The crime was common, but the motive was peculiar to the woman. The penalty, too, of disobedience to both was death; but a sublime and prophetic distinction was made in favour of the future "mother of all living," of whom was to proceed one who should "swallow up death in victory," &c. The temporal punishments inflicted on Eve were marked by an intellectual pre-eminence in suffering—Adam's, by personal degradation: to Adam was assigned the task of physical labour; "In the sweat of thy face shalt thou eat bread, till thou return unto the ground from whence thou wert taken; for out of it was thou taken, for dust thou art, and unto dust thou shalt return." A humiliating vocation—a humiliating reminiscence, both spared as denunciations to Eve. Her retribution, on the contrary, was founded on the affections and on the mind—"sorrow," that was to be multiplied, and "pain" (corporeal, indeed, in the first instance), but connected with grief and anxieties still more harassing. Her desire, also, was decreed to be "to her husband" (that devotedness, the attribute of her peculiar and finer organisation); and her "submission" to his "rule" was the penalty of her sensibility, no less than the token of physical inferiority. In this sacred history of the origin of the species, whether viewed through the interpretations of faith, or the glosses of philosophy—as a literal fact, or a prophetic parable—as a tradition beyond all contemporary record, or as an image of the astronomical aspect of the heavens—there is a strict accordance with the great dogma of the East, that woman was a creature of high intellectual aspirations: and every subsequent epoch in sacred history produces evidences of her spiritual agency and mental energies, in carrying on the great moral economy of the creation."

We cannot tell where, in this extract, her ladyship gets the "perfect equality" of Adam and Eve, and then discovers that to him *alone* was assigned the corporeal task to dress and keep the garden, whilst his rib, like a modern fine lady, was to sit in her bower "a doing of nothing," though specially appointed to be "a mate and a help" to him. Or, again, to boast of Eve's having, as the stockbrokers phrase it, the "first call made on her intellect;" and, for this very sufficient reason, that the most subtle of all devils paid her the compliment of supposing that she would be more "difficult" to deceive than her male partner! Pity 't was that, notwithstanding this absence of "a facility to be won over," his flattery and glozing prevailed, and our common mother took the fruit, with this amiable apology of Lady Morgan's, that she would not have tasted a bit of it if she had not thought it would "make one (i. e. herself) wise." Though she was the first, she certainly is by no means the last woman who, by longing for what they call wisdom, are likely to bring misery on themselves and others. Adam's handsome and gentlemanly sacrifice of himself to the woman of his heart is very ungalantly termed "weak and reproachful,"—it has always struck us as being the noblest example of devotedness to the sex which his sons, for thousands of generations, should set before their eyes for imitation. With the concluding paragraph we shall not meddle: like the opening of the work, it is grandiloquent and mysterious; and to us (with only coarse male organisation) rather unintelligible.

As we have alluded to the poem, we may adduce a sample of its sounding phraseology:—

"The chronicles of six thousand years, the records of the known world, lie open for the benefit and the wonder of mankind, preserving, in pages indited by the lights of their respective times, monuments of the ignorance, the timidity, and the credulity of successive generations. From the earliest aggregations of society, man, in his shallow pride, has laboured to perpetuate the memory of his own imperfection, the story of his selfishness and his errors; and the annals which he has bequeathed from age to age, for the benefit of posterity, are but evidences of the long and painful struggles by which the human species, on isolated points, and for periods brief and remote, have succeeded in partially escaping from physical evil, and from moral darkness. It is thus the artless illuminations of antique missals, in preserving the rude outlines of the dark originals they were meant to honour, perpetuate, also, in vivid tints, that expression of feebleness and suffering which is the inseparable characteristic of suspicious and unaccommodated ignorance in all ages. It was not till the close of a long and unmitigated reign of barbarism, even in regions most favourable to intellectual culture, that mind began at last to assume some supremacy over brute force; but, from its first inroad of inquiry upon the density of ignorance and prejudice, it has proceeded steadily onward in its high career, unsubdued by penalties and persecutions, undaunted by calumnies and contempt. Neglected, when not discouraged, often repelled, and occasionally crushed, amidst the conflicts of races, and the fall of empires, science has receded only to advance; multiplying the blessings of physical existence to the species, and 'purging the general weal' by its extorted truths."

How, with all this, and much more confessed, the author can write a book to shew that, while all else has "progressed," woman has been left behind by improvement and science "at the very starting post of civilisation," is a paradox we cannot comprehend, and we are, therefore, compelled to postpone our understanding of the argument till the work is happily finished; which, from the talent displayed in it as an historical retrospect, we trust it may speedily be, notwithstanding the defective vision of which, we regret to see, the author has reason to speak in sorrowing language.

*The Book of Archery.* By George Agar Hansard, Gwent Bowman, author of "Trout and Salmon Fishing in Wales." 8vo. pp. 456. London, 1840. Longman and Co.

THIS is a very pretty book, and a very pleasant book,—pretty to look at, pleasant to read. Fifteen engravings, after F. P. Stephanoff, afford historical and poetical illustrations of the subject of a very interesting character; and a series of etchings by W. H. Brooke, presenting a hundred most spirited figures employed in archery, battle-pieces, &c. &c. &c., is in itself almost a universal representation of the art, its instruments, its modes of use, and powerful effects.

The letterpress is of the true gossiping and miscellaneous character, which best relieves antiquarian research and the digging into old authors for all the information which an inquiry spread over the face of the globe is sure to elicit. Old England, Wales, Scotland, France, America, Persia, Parthia, Rome, Greece, north, west, south, and east—in short, all times and all lands contribute something to the annals of archery; and, in travelling over

these, our author has contrived to bring together a mass of curious and entertaining matter, which even those who never bent a bow or flew an arrow may peruse, and find in it very delectable pastime. For ourselves, we will merely select a few unconnected extracts, which may serve as examples of the general substance; and we begin with a striking account of a Caribbee affair, in which archery cuts a prominent figure:—

"The Rev. Thomas Davies, of Llanelly, in South Wales, about the year 1600, wrote an amusing account of the Caribbees. He thus explains, by reference to archery, an extraordinary receding of the forehead observable in the male inhabitants of that race. 'As soon,' says he, 'as the children are born, the mothers make their foreheads flat, and press them so, that there is a descent backwards; for, besides that this form is accounted one of the principal pieces of beauty amongst them, they affirm it facilitates their shooting up to the top of a tree, standing at the foot, whereat they are extremely expert, as being brought up to it from their childhood. At a hundred paces, they will hardly fail striking a half-crown piece. Among every celebrated nation of archers a fondness for the bow has been imbibed, as it were, with the mother's milk; and the little rogues readily exercise themselves in shooting from the moment they are able to clutch a bow and arrows.'"

And the author adds in a note:—

"Caribbee Indians of the present day excel in shooting, and use a very tall bow, with arrows little inferior in length. I possess many of both, and well remember a captain of a vessel who visited one of their villages, and was so delighted with his reception, that he accompanied them into the woods, on their favourite expedition of shooting monkeys, which they strike with fatal certainty from the tallest trees by a perpendicular shot. On bidding adieu to his hospitable, kind-hearted entertainers, one of the white men imprudently took more notice of a young Indian girl than was agreeable to Indian notions of propriety. All instantly retired, leaving him and his party alone; upon which his knowledge of the habits of these savages induced him to warn them that instant flight could alone preserve them from 'being treated as they had seen the monkeys.' Already had they got about eighty paces, and were just about to turn an angle of rock which would have effectually screened them from every kind of missile, when the captain was observed to spring some four feet from the ground, and, with a groan, fall dead upon the sands, with one arrow sticking in his head, and another between his shoulders, which had come out at his breast. No pursuit was attempted; the outraged Caribs having been to all appearance appeased by this sacrifice of the offending Englishman. The fate of a number of his countrymen, who attempted to settle among these Indians about two centuries and a half since, also furnishes us with a very lively description of the terrors of their archery. 'Then came the arrows so thick out of the wood,' says one of the survivors, 'that we could not get our match in' (they were armed with matchlocks) 'for pulling them out of our bodies; so, amongst the band, there were but five or six pieces discharged, which, when the Indians saw give fire, they did fall flat on the ground, shouting and crying with a most hellish noise, naming us by our names when their arrows pierced us. So, when they saw we could not hit them with our pieces, they would come so near us as though they purposed to

make choice in what place to hit us. Some they shot in the faces, others through the shoulders, and of others they would nail the feet and the ground together. Master Budge and Robert Shaw ran both into the sea, and were there drowned or killed with arrows. Master Finch had a little buckler, with which he did save himself a long time; but at the last an arrow passed through both legs, that he could not go, and, stooping to pull it out, they killed him; and if any of us offered to run at one or two savages, straightway they fled a little distance, but suddenly twenty or thirty would enclose us, and still shooting arrows into them until they were down, with a great Brazil sword they beat them to death. Master Kettlebye did behave himself very gallantly, for he did not respect what arrows he received in his body, so he could reach one stroke at a Caribbee; but they were too nimble for us, in regard they were naked. Yet, nevertheless, we ran through them all, thinking, if we could escape that ambush, there had been no more to trouble us; but as I was pulling arrows out of his body, to the number of twenty at the least, a third ambush burst out of the woods, from whence came an arrow and hit him in the breast, which he perceived would be his death, for he could not stand but as I held him; and I was forced to let him go and shift for myself. Then I overtook young St. John, his body almost full of arrows, of which I pulled out a number; but what for the blood that ran from him, and the extreme heat he was in from his flight, he failed to overtake the rest of our company that was before. And still the Caribbees did gather ground upon us, and arrows came thick on every side. And then the poor youth willed me to entreat his men to stay; and so, having overtaken one, I caused him to stay, which he was not willing to do; for he told me his sword would not come forth of the scabbard, so I took hold of the hilt, and betwixt us both pulled it out: but before we had made an end, these cruel and bloody Caribbees had encompassed young St. John; yet to my grief I did stand and behold his end, who, before he fell, did make them give back like so many curs from a lion, for which way soever he ran they all fled before him. His body was so loaded with arrows that he fell to the ground; and upon one hand and knee he did keep them from him with his sword, so much he scorned basely to die at their hands. Myself and the man whose sword I had helped to set free, were now the only marks they aimed at; for having rifled young St. John, they pursued very hotly, which caused us to make haste to four of our fellows, who were entered into a narrow path leading through the woods from the sands, to the houses where we dwelt. But there was in the path another ambush, which drove us back to the sands; and when they saw us so hardly chased they entered the path with us again. On one side thereof was a high mountain, the other went down a low valley. The first four of our friends took up the mountain, by which means they offered too fair a mark for them to hit, who dropped down one after another. All this time neither Harry, Peter Stokesley's man (a merchant now in Bucklersbury), nor myself, was shot, but as we thought desperately to burst through them into the narrow path, there came an arrow and pierced quite through his head, of which he fell suddenly, and I ran to lift him up, but he was dead, without speaking one word to me at all. Then came there two arrows and hit me in the back, the

one directly against my heart the other through my shoulder-blade; so sword in hand ran I upon them desperately, thinking before I had died to have been the death of some of them: and in my running I saw Captain Anthony, with an arrow in his bow drawn against me, who stood until I came very near him, for he purposed to have sped me with that shot, which, when I espied coming, I thought to have put it by with my sword, but, lightening upon my hand, it passed through the handle of my weapon, and nailed both together. Nevertheless I continued running at him still, and before he could nock another, made him and all the rest turn their backs and flee unto the sands again; which opportunity when I espied I leaped into the wood, down to the valley, where I found a salt lake; and hearing them with loud shouts and cry, which they use in sign of triumph and victory, pursue me still, I leaped into the water, with my sword nailed to my hand, and two arrows in my back, and, by the help of God, swam over, but with much ado, for the further side was shallow, and I waded in mud up to the waist, which had almost spent me.—*Another Class of Indian News; or, a True and Tragical Discourse, shewing the lamentable Miseries endured by Sixty-seven Englishmen, &c. By John Nichol, one of the aforesaid Company. A.D. 1608.*

This butchery may be contrasted with a more harmless story:—

“A school of cross-bowmen,” engaged at their exercise in a beautiful green alley, with butts at either end, figures as the illumination of an old French MS., dated 1450, at present in the King’s Library. A marker attends, and is represented making one of the signs specified above. Two centuries ago they merely fixed a very diminutive *blanc* in the centre of the butt by a wooden peg, from which the marker measured to the arrow, before giving his signal. We have this custom plainly alluded to in the following rather ludicrous paragraph:—“Upon a time, being in the king’s pavilion, who was desirous of partaking some novelty, there instantly appeared upon the table a pair of butts and whites to shoot at, where suddenly came in six dapper pert fellows like archers, in stature not above a foot high, and all other members accordingly proportioned. Their bows were of the side-bones of an overgrown pike; their strings of a small sleazy silk, not bigger than the thread of a cobweb; their arrows less than picktooths, feathered with the wings of small flies, and headed with the points of fine Spanish needles. These gallants made a show as if they were to shoot a match, *three to three*, and roundly they went about it. In the middle of the game there was a shot that rested doubtful, which, as it appeared, the gamblers could not well decide. Then Merlin called one of the servants, who had a somewhat big nose, and bade him measure to the mark, and give it to the best. To which, when he stooped and inclined his face, the better to umpire the matter, one of the pigmy archers that had an arrow to shoot delivered it from his bow, and pierced him quite through the nose, at which he started, and the king heartily laughed; for there was no room to be seen, the butts and the archers having together disappeared.”

From among a multitude of anecdotes of the wonderful force of the arrow, we copy the following:—

“In one of their earliest skirmishes with the Apalaches, a Spanish general called Moscoso received an arrow in his right aide, which pierced his buff jerkin and coat of mail, but

did not prove mortal, because it entered in a slanting direction. The officers of his staff, wondering that a piece of armour valued at more than 150 ducats should be unable to resist a reed arrow headed merely with a sharp flint, resolved to prove the temper of their own, in order to ascertain how far they might be depended on. Whilst, therefore, they were quartered in the town of Apalachia, several who wore that species of defence procured a wicker basket, very strong and closely woven, and hung around it a coat of mail which was judged to be about the heaviest and most impregnable in the whole army. Then ordering a youthful Indian captive to be introduced, they promised him freedom in case he pierced the mark at the distance of 150 paces. Immediately the barbarian clenched his fists, shook himself violently, and contracted and extended his arms as if to awaken all his force; then stringing a bow which had been previously delivered to him, he elevated it at the mark, and loosing his arrow, it drove through both armour and basket, and came out at the opposite side with violence sufficient to have slain a man. The Spaniards, finding a single piece of armour was ineffectual to resist the arrow, threw a second upon the basket, and ordered the Indian to repeat his shot; when he immediately pierced that likewise. Nevertheless, as the shaft did not pass entirely through, but remained sticking half in front and half behind, because, as the barbarian asserted, he had failed this time to put forth his utmost strength, he begged to be allowed to shoot a third time, on condition that if he failed to drive the arrow through and through, he should immediately suffer death. The Spaniards, satisfied with what they had already witnessed, refused to comply with his request, but ever afterwards held their coats of mail in little esteem, and contemptuously styled them ‘Dutch Holland.’”

We reserve a few further illustrations.

*Medical Etiquette; or, an Essay upon the Laws and Regulations which ought to govern the Conduct of Members of the Medical Profession in their Relation to each other. Compiled exclusively for the Profession. By Abraham Banks, Esq. 12mo. pp. 104. London, 1840. Fox.*

ETIQUETTE is so nice a thing, that we cannot allow any branch of it to be expounded “exclusively” for any profession. Why should parsons or lawyers (some of the latter even called *Civil*) seem rude and uncultivated when compared with genteel doctors and polite apothecaries? As guardians and guides to the public, in all matters of paramount importance, we cannot assent to it; and, therefore, we must notice the book of Mr. Abraham Banks, member of the Royal College of Surgeons, &c.; or “better expressed thus:—M.R.C.S.L.; L.A.C.L.; *Shetics*, &c. &c. &c.”

Mr. Banks is an author after our own heart. His title-page promises entertainment, and his dedication to Dr. Roots keeps up the promise: never were such banks and roots seen together. For what says the former of the latter, as he appears to uphold and nourish him, and spread his ramifications far and near?—he is a man “whose enlarged views of liberality are as far removed from that vain and ostentatious display which daily disgraces our public journals, as the pure atmosphere of the celestial regions above us is from the foul air which inhabits the subterranean caves beneath us.”

After a dedication, in due course of things, there comes a preface; and our author is a

tickler. He tells us therein, to whom his treatise is *not* addressed; and yet these are the very people by whom we should have thought his precepts most wanted. Mr. Banks is of a different opinion and declares—

"In the first place, it is not addressed to him,\* who from accident, or any other cause, having been called in to attend another man's patient, endeavours by every mean and underhand insinuation to wrest that patient from the original attendant; nor is it addressed to him who may have been sent for, whilst another was in attendance, and taking advantage of the absence of that other, after much apparently skilful examination, and many inquiries to no purport whatever, casts up his eyes to heaven, and, with that mysterious waving to and fro of the hands, and that significant medical 'hum,' exclaims, aghast in wonder and amazement, 'What a pity you had not sent for me before—if I had only been called in *six hours* sooner—but it is now too late, it has gone too far;'—nor to him, who under similar circumstances, on being shewn the medicine which had been prescribed, so natural to the friends of the patient, examines the devoted bottle with wonderful sagacity, and after due smelling, and sniffing, and tasting, and various other mountebank operations, dooms the unconscious deadly potion, consisting perhaps of a little saline mixture, to the awful punishment of ejection from the window; nor is it addressed to him, who resolves to build up a reputation for fame at any price, who depends more for success upon detraction, and sapping the reputation of others, than on any intrinsic merit of his own.

But, to aim at higher game, it is not addressed to him, who takes advantage of having once been summoned to a family, to call again unasked, and by sundry intimations endeavours to lower the estimation in which the regular attendant is held, and thereby pave the way for his own admission; to call such conduct unprofessional and dishonest, is not rendering it full justice; it is base and unmanly in the extreme; it is assassination in the dark—the resort of the coward. The man who gives his adversary due notice of attack, and thus enables him to withstand the shock of his charge, who openly declares him to be an ignorant blockhead, and unfit to practise his profession, is a noble and honest character compared with this other. Nor, lastly, is it addressed to the man who carries his profession upon his back wherever he goes, who never loses an opportunity of instilling into the minds of all those who have the misfortune to pass before him, that he is the incomparable; that if a person really wishes to be cured, to him they must go; that of all the professors of medicine he is, emphatically, *the professor*—the nonsuch of the profession; or, to him who seizes the opportunity, when the family are present, of reprimanding a young practitioner for alleged indiscretion, for the malicious purpose of injuring his reputation, or who expatiates in his absence on the advantages of employing a physician exclusively, who understands disease and infirmities better, and who, when unhampered by a general practitioner, orders little or no medicine: for such men there are, to their shame be it said, amongst the leading physicians of the day."

"Can such things be

Without our 'special wonder'?"

They "must be," for Mr. Banks is a witness that they are. Thus, in his recondite chapter on the "*Affection of Mystery*," he states,—

\* "All the imperfections of character alluded to are unfortunately taken from living practitioners."

"The habit which some medical men have of assuming an air of mystery, and using technical terms in the presence of their patients, is, we submit with all deference, very unbecoming, and quite unworthy of so high an occupation; and though it may sometimes give an impression of great learning and talent, yet it must often excite ridicule and contempt. We have heard physicians use such words as '*secundum artem, ad deliquium, toastum boastum*,' &c. &c., when talking to a general practitioner before others; such can only impose upon the ignorant."

We are not quite so sure of this. *Toastum boastum* are strong words, and we have seen the wizard at the Strand Theatre perform very extraordinary feats with less powerful conjuration. Yet Mr. Banks adds:—

"When any person unnecessarily uses technical terms in the presence of others, who may not be supposed to understand them, we regard it as a direct insult to those persons; it is, in fact, laughing at them. Closely allied to this habit, is that of clothing medicinal preparations in false colours, such as mixing rose pink with linseed meal, vermilion with Epsom salts, burnt sugar with Goulard water, &c. &c. We know that strong excuses may be pleaded in extenuation; but we may be permitted to deplore that constitution of society, which renders such conduct almost necessary; we believe it to be perfectly incompatible with an ardent love of truth, and a glowing admiration of rectitude."

Perhaps this corollary is just; and however excusable, we cannot think it consistent with a glowing admiration of rectitude to administer vermilion and rose pink to the pale and wan patient as colourable means for improving their complexions.

But there are other secrets worth knowing connected with physic and physicking. Being called out of church, and galloping horses till they are all in a lather of sweat and foam, are obsolete tricks, exploded by the lowest practitioners. They "have given way to other arts equally reprehensible, though of a more refined character, and not quite so obvious to public perception; such as singing very loudly over and above all the rest of the congregation, taking a conspicuous pew, and sometimes mounting on a hassock, in order to be well seen; giving the responses in very audible language, so as to excite the observation, 'Who is that pious gentleman?' making himself very officious, particularly in the charitable department, so far as the collecting goes, more especially if there is any chance of filling a medical appointment. A petition for a charity forms an excellent plea for calling on the wealthy, and putting in a good word for number One—the more so, if nobody else will do it; bowing to every one he meets, though, perhaps, he has never seen the person before; assuming a very religious tone, according to the character he has to deal with; as, 'Well, ma'am, we have maturely considered your dear little girl, and ordered such and such medicine, which, by the blessing of God, we hope will have the desired effect:' all this hypocritical cant, if it be not criminal, is truly disgusting. Another recent manœuvre, which is sometimes practised, is putting up counterfeit medicines, and letting them lie about the counter in the surgery or shop, so as to give a false impression of business; talking largely, and contriving, if any excuse can possibly be obtained for so doing, to introduce the name of some nobleman or baronet into all his discourse, chiefly before strangers. We have witnessed instances where

some unfortunate peer, who may have accidentally got his name upon an apothecary's books, has had that name mangled most unmercifully, as, 'John, has my Lord Such-a-one had his medicine?—be good enough to send that medicine to his lordship directly; I will attend to you, sir, as soon as I have ordered something for my Lord —,' &c. We remember hearing of a man who could not open his mouth without letting people know that he kept a horse and chaise; a bet was made upon the strength of this, that he could not answer the simplest question without introducing these essentials of his establishment. The question put was direct enough; he was asked what o'clock it was? and answered, 'When I, with my wife, passed the Horse Guards this morning in my horse and shay, it wanted,' &c. Some adopt the plan of sending medicine to the wrong houses, pretending it to be a mistake, in order to have a plea for calling to give an explanation, and so make themselves known. Others have a way of putting on their cards all the honourable distinctions which they possess, or have possessed, as surgeon to some back-garret institution, which nobody but themselves ever heard of. The most unimportant situation has afforded an excuse for adding three or four capital letters to the name: thus we see all the letters of the alphabet have been tortured to fit some office; so that it is oftentimes as difficult to tell what G.U.L., or F.O.P. mean, as to decipher some of the ancient inscriptions. Keeping patients waiting longer than necessary is any thing but humane: writing up *Advice Gratis* is a mere claptrap, to make people suppose that some advantage is to be gained there which is not at any other apothecary's."

Out of all these recipes, surely even a quack should be able to get into good practice. Mr. Banks is up to them all; and we hope he will see his way. The affectation of religion which he so justly condemns does not, we observe, extend to morality,—for he says:—

"We would now appeal, with all that solemnity which the importance of the thing demands, whether the members of the medical profession would not do well to take under their protecting care the glimmering embers of morality; for if they do not, who shall? Should the Law make the attempt, it would be like nursing a serpent at her very bosom; for moral law and statute law are at total variance: the one of a high, noble, refined, and elevating character; the other of a low, mean, grovelling, and outreaching nature, the demoralising tendency of which is but too apparent in the majority of its professors. The Church! But when has Sectarianism shewn herself favourable to the development of mind? When has she proved herself capable of taking those large and extended views of human nature, which comprehend the whole race? Church history has hitherto been little else than one continued series of oppressions, of prejudices, of tyrannies, of usurpations of the blackest description. We fear that the mild and delicate plant of morality would wither under the protection of Sectarianism, which, however admirably adapted for sowing the seeds of dissension in families, and fanning the flame of civil discord, is wholly unfitted for this nobler function. The Educator! the natural ally of morality, to whom society would look as to a parent for assistance—but what has he as yet done, but train some for oppression, some to oppress? From the contemptible remuneration, and the low estimation, or rather the suspicious aversion, with which he is generally viewed, his profession

has become merely the refuge of the mean-spirited and the destitute, where vanity, jealousy, and dogmatism, are the prevailing passions. Alas! thou poor Morality! If thou art deserted, and forsaken by the only men capable of throwing a shield of protection around thee, and infusing new vigour into thy spirit, the members of the medical profession, what hope hast thou? Nay; despair, and die!"

Heaven forbid! Get Morality into the Pharmacopœia, and it will be safe enough: call a consultation of doctors upon it, and they will prescribe for and cure it were it ten times more sick than it is. Mr. Banks holds, that a physician may form an alliance, *argent comptant*, with a chemist, though not with an apothecary; and he is sadly opposed to all medical charitable institutions and dispensaries. And, after all, what is medical skill? "When (says our author) a highly fortunate practitioner of this town was asked to what he considered he was most indebted in his professional career, he replied, to his attention; because not one patient out of twelve could judge of his skill, but all could judge of his attention; and if they received this, they would give credit for the skill. An anecdote bearing upon this point was related to the writer a short time since: an elderly lady, residing a short distance from town, was attended by a gentleman of some standing in her neighbourhood, but who had never thoroughly had her confidence, and one day entirely lost it by the following ill-timed remark. His carriage was standing at the door, which was near a turnpike, and whilst he was apparently feeling the old lady's pulse with much attention, he was fumbling in his pocket with the other hand, and then suddenly exclaimed, 'How stupid I am, for I have forgotten the half-pence for the gate!' She sent for a friend of the writer soon afterwards, and told him she should never think of employing Mr. — again, as she was certain that he was thinking much more of his own purse than her pulse: a remonstrance against this idea was in vain, and from that period the gentleman lost a good patient."

He would remember the toll better next time: and there are other small matters not undeserving of consideration:—

"There are a great many trifling questions, about which there seems to be no general understanding, and it is to be hoped there never will, as they are quite unworthy of notice. It may, perhaps, be as well to allude to two or three, just to illustrate our meaning; such as, whether prescriptions should be written in English, Latin, Greek, or double Dutch? Whether it be lawful for one practitioner to decipher the prescription of another? Whether medical men should dress in black, or brown; wear kid, or Berlin gloves; eat peas, or beans, or go without if they cannot get either? Whether physicians should refuse their fees, if they are not wrapt up in writing-paper, and sealed with fancy wax, and put into the right hand? Some persons have a very coarse method of paying a professional man, bouncing a sovereign down upon the table, making it ring in his ears—but this only proves it to be good, which we submit with all deference is an important thing to know in taking a sovereign; and the sound of money gives a pleasurable sensation to some people, although it be the sound of the parting knell. Others will pay a bill in silver, which, though it may be rather cumbersome, yet, in the absence of gold, we presume will be found very useful. Whether practitioners on entering a

house should put the right or the left foot first? Whether they should wear gold watch-chains, or simply ribands? Whether they should dine at two o'clock, or ten in the evening? Whether it is etiquette to attend their own wives, or not? All these things, of course, are matters of taste and feeling. Whether a physician may bleed, or even carry a lancet, or prescribe in any surgical case, or whether a *pure* surgeon may prescribe in any medical case? It appears to us a most outrageous piece of tyranny that a physician should not be allowed to bleed, or any thing else that he thinks proper; on the contrary, we think a man must make but a poor physician who is unable to bleed, and that he is bound in honour and conscience always to carry a lancet in his pocket."

#### *Etiquette for Ever!*

*Arundel; a Tale of the French Revolution.*

By Sir Francis Vincent, Bart. 3 vols. 12mo. London, 1840. Saunders and Otley.

To the dreadful scenes of the French Revolution all sympathies are awake. Many of these, as well as the chief actors in them, are here interwoven with a fictitious narrative, in a skillful and pleasant manner. The hero and heroine are like all other heroes and heroines—models of beauty and virtue; scarcely more perfect, however, than those beside whom they are here placed—Marie Antoinette and the Princesse de Lamballe, in whose reality there was, indeed, more of deep tragical romance than in the most exaggerated portraits of the pen. Robespierre, Marat, Danton, Lafayette, Mirabeau, are, of course, prominent. We think part of an interview between some of these and the hero, Arundel, a fair specimen of the author's ability:—

"And now," said he, "you are just come in time to pacify Marat, who has been threatening my young friend and myself with his denunciations." "What, Marat, are you there?" cried Danton; "I declare I had quite overlooked your diminutive carcass; but what is the matter, man?—you look more yellow and bilious than usual." "Oh!" exclaimed Robespierre, "there is not much the matter; he wanted to lay those dirty hands of his on Mr. Arundel's cravat, and he met with a repulse and a lecture, which he did not expect from one in my house." "Is that all?" said Danton; "it served him right. Pah!" continued he, seizing Marat's unwilling hand in his gigantic fist, "what a filthy hand it is!—why don't you wash them at least once a-week?" Marat saw it would not do to be angry where every body was inclined to take part with his adversary, and he thought it wisest to turn it off with a jest; but it was a jest of his own. "Never mind the dirt," said he; "it is the hand of a good patriot; but if my hands must be washed, it shall not be with water. The ink of the *Ami du Peuple* can only be washed out by a bath of aristocratic blood, and I hope I shall not have long to wait for it." Robespierre shrugged his shoulders at this speech. Panis and Hébert laughed, and Danton said:—"By G—, if it is to be of your own shedding, you will have to wait long enough. You are an admirable trumpeter to sound the onset, but when you have done that, you get to the rear as fast as you can. But come, never mind what I say, man," seeing Marat's brow look blacker than ever. "I wish you would leave your heroics, and confine yourself to common sense. All this vapouring and threatening does us more harm than good; three hundred thousand heads falling on the scaffold is a very pretty poetical idea, but nothing

more; and if you wish to see it realised you must hit hard, and not waste your time in talking. And it was principally to consider what we are to do, and how we can take advantage of the events of yesterday, which, properly managed, will turn entirely to our account, that I —" "Stop, gentlemen," cried Arundel; "you seem to forget that you are about to deliberate in the presence of a total stranger, and one who has no wish to be initiated into your schemes and plans." "By heavens, that is true," said Danton; "but I concluded, naturally enough, that you were one of us." "No, I am not; and therefore I will, with your permission, take my leave. In two days I believe I shall be on my road to London; how long I shall stay there will depend upon circumstances; but I shall ever feel grateful for the consideration with which you have treated me." This was said to Robespierre, who had followed him into the antechamber. "Farewell, then, Mr. Arundel; I believe you are doing the wisest thing you can, for I am afraid you have made an irreconcilable enemy of Marat, and he is a very popular man. He is an excellent patriot, and a great friend of mine; but if he has a fault, it is, perhaps, that he carries the feeling of revenge to a blamable excess: we will, however, see what we can do to soften him during your absence." "I beg, sir," replied Arundel, "you will take no trouble about it. I despise him and his enmity too much to give myself another thought about either of them."

*Kew and its Gardens.* By Frederick Scheer, Esq. 12mo. pp. 69. 1840. London: Steill. Richmond: Darnill.

As we take more pains to be right than to be at the trouble of rebutting contradictions or mistakes relative to our statements, we did not think it worth our while to notice the variety of paragraphs, correspondence, &c., which appeared in the newspapers, subsequent to the effort of the *Literary Gazette* to protect Kew Gardens from spoliation. That effort was effectual; for it only required publicity and to call attention to the subject to put an end to the proposed destruction of these interesting grounds; and it need hardly be observed, that no Government could desire such an injury to be done, though in this, as in many other instances, every government is exposed to be misled by the representations of underlings, upon whose reports they must of necessity rely, and who have objects of their own to attain when they advise measures detrimental to the state.

"The botanical world (says our author) has been lately roused from the even tenour of its way by ominous rumours, threatening destruction to the Royal Botanic Gardens at Kew. There is no doubt that intimation had been given to the Horticultural Society, and perhaps to others, of the existence of a desire to dispose of the plants, collected in the course of nearly a century in these gardens; and it has been said, that the expense annually incurred was too heavy to be borne any longer by the British nation. The

\* Among the rest our honest and able friend, Mr. Loudon addressed a letter to "The Times," saying, "In consequence of a passage quoted from the *Literary Gazette* in the 'Gardener's Magazine' for March, in which, among other things, it is stated, that the plants in the Botanic Garden at Kew may be had by whoever may apply for them, I have received a number of letters requesting to be informed in what manner the applications are to be made, or requesting me to apply for certain plants, &c. I believe the rumour that the plants are to be obtained on asking for is unfounded; or at all events, that I know nothing further of the intentions of Government than what is stated in the paragraph alluded to," &c. &c. We did not, however, go a jot beyond the facts of the case.—*Ed. L. G.*

Council of the Horticultural Society, with a spirit highly honourable to themselves and to science, declined becoming a party to a proceeding so inauspicious to their pursuits; and we trust that no corporate body could be found in the United Kingdom capable of deviating from the dignified course of which those gentlemen have set the example. Amongst private individuals, however, parties less scrupulous might be found; and foreign governments would of a surety become eager competitors for the abstraction of botanical treasures, still of immense value, and connected with events of which Great Britain may be justly proud. It is this apprehension which has prompted us to call the attention of the public, more especially those interested in botanical pursuits, to the importance and bearing of the matter in question."

As we have said, the business is already done; but still we rejoice in our ally who has laid the history, merits, and details, of these Gardens more amply before the world in claiming protection for their treasures and encouragement for their further cultivation, in a manner becoming a country like England.

"The most ancient record which the indefatigable Lysons could find of Kew, was in a court roll of the manor of Richmond, in the reign of Henry VII.; it is there written Kayhough; subsequently, its name is varied to Kayhowe, Kayhou, Keye, Kayo, and Kewe. It first became a parish by an act of parliament in 1769, having been till then a hamlet to Kingston. It is part of the manor and union of Richmond, the Hundred of Kingston, and the eastern division of the county of Surrey, and is in the diocese of Winchester and the deanery of Ewell. Its distance from Hyde Park Corner is six miles and a quarter. The soil is sandy, and remarkably porous and dry; and the small quantity of land not included in the Royal Gardens is, for the most part, used for growing asparagus, and other superior vegetables, for the London markets."

Kay-haugh is unquestionably the ancient name: haugh being a flat or level on the banks of a river. But leaving etymology, we adopt a passage or two touching the place itself.

"A catalogue of the plants was published in 1768, by Dr. Hill, under the name of 'Hortus Kewensis,' with a second edition in 1769. This was followed by Aiton's work under that title, in 1789, in three volumes octavo. It enumerates 1116 genera. The Earl of Bute, Sir Joseph Banks, Dr. Solander, and Dryander, took all a lively interest in it, and at that time it ranked very high among botanical works. The opportunities for rendering it perfect were great; but the system which Mr. Aiton pursued bespeaks him to have been a man endowed with those qualities which facilitate the accomplishment of great enterprises. He associated himself in his arduous occupations with Dr. Pitcairn of Fulham, and Lee of Hammersmith. Whenever new seeds and plants arrived at Kew, they were divided into equal shares amongst these three cultivators. Each pursued his own way of propagation or growth, and by an honourable and delightful competition those losses and failures were avoided which attend a less liberal plan—that of retaining what is new and rare at one place, and treating it in one way. Whoever of these three competitors succeeded best, divided by mutual compact his plants with the others. This conduct speaks volumes. No wonder that success should crown endeavours based on such liberality and true love for science! Mr. Aiton died in 1793. On his burial at Kew his pall was supported by Sir Joseph Banks, the

Rev. Dr. Goodenough, Mr. Dryander, Dr. Pitcairn, Mr. Dundas of Richmond, and Zoffany the painter. His son, the present Mr. Aiton, succeeded him; and published in 1810 a second edition of the 'Hortus Kewensis,' in which upwards of 1600 genera of plants are enumerated. No doubt, the most splendid additions were made to the flower-gardens and greenhouses of Great Britain and Europe during the reign of George III., and a detailed history of Kew would be an elegant episode in that of botany. Unluckily no faithful hand has preserved any memorials of it. But to give an instance, we should like to see a pictorial representation of the scene of Sir Joseph Banks' introducing the first *Hydrangea hortensis* to Kew, about the beginning of 1789, for the inspection of the curious. It had begun to flower in the Custom House, and its green petals were a puzzle to the botanists of the day. The next day he exhibited it at his house in Soho Square, from whence it was returned, and lived in Kew, the parent of its numerous progeny now spread all over Europe, till within these few years. This year saw also the *Paeonia Moutan* introduced from China, and it is in the Gardens to this day, alive and well, a venerable monument of happier times. The common *Fuchsia* also became then first known, and we are told that Lee sold small plants at five guineas each!

"Yet the death of Queen Charlotte, who finished her life in November 1818, at Kew Palace, the loss of Sir Joseph Banks, and, perhaps, also that of Sir Everard Home, appear to have begot an indifference about these Gardens, which is difficult to account for on any reasonable grounds. In 1823, a considerable portion of Kew Green was surrendered by the inhabitants, who had a common right in it, to the crown, for the express purpose of improving the Gardens; but the expectations then entertained were disappointed, and the understanding that access should be given to the pleasure grounds on the most liberal footing, has never been carried into effect. Soon after, we are told, a fatal system of economy was adopted, and the means hitherto provided for the Botanic Gardens were curtailed. At the same time, noblemen, private individuals, and nursery-men of enterprising spirit, took up horticulture and floriculture with great zeal and vigour; and the Horticultural Society, by pursuing the very opposite system of that which had gradually crept in at Kew, attracted a crowd of supporters, who could with facility gratify their curiosity at Turnham Green, and whose wishes and wants were met by a liberal distribution of seeds and plants, obtained from various parts of the world by zealous and successful collectors. Mr. Aiton had in the interim become Director General of all the royal gardens and parks, and was overwhelmed with occupations, which necessarily took his attention from the minutiae of botanical gardening. Men of eminence and learning complained that they were received, on their visits to Kew, by ill-informed labourers, and that the smallest modicum of attention was bestowed on those, whose presence every where else would have been hailed as an honour, and recorded as an event of importance. Kew descended somehow from the high station which it had held; it had, in fact, ceased to lead in matters of botany, and the idea of its receiving or disseminating any novelties was gradually shelved amongst the obsolete reminiscences of by-gone days. The noising abroad of these complaints probably suggested the idea that it was approaching

that state of final decay, the consummation of which it would be a charity to accomplish at one fell stroke!

A commission was appointed by the Lord Chamberlain, to report, after due examination, upon the real state of the Gardens. The commission consisted of Doctor Lindley, Mr. Paxton, and Mr. Wilson. Their report was upon the whole, as we have been given to understand, rather favourable; but it contained the proposal that a large sum of money, we think some fifty thousand pounds, should be laid out, to put every thing to rights; it, however, strongly deprecated the notion, then already prevalent, of breaking up so excellent an establishment."

Our author himself observes:—

"At a time when the British people counted scarcely half their present number; when they possessed not one-fourth of their present wealth; during the maintenance of continued and expensive wars, means were found for establishing such gardens: surely it is ridiculous to suppose that now means are wanting to keep them up, or provide for the necessary additions? That some of the glasshouses must be enlarged is clear, but it may be done gradually, and would not require an additional five hundred pounds per annum. Supposing, however, that government were to allow an additional thousand pounds a-year, we think that in five years from this day Kew might be altogether regenerated. The system on which these Gardens are at present kept, is one of a complicated, not to say a mysterious nature. We are told that all repairs are done by the Woods and Forests. The wages and coals, which amount to less than a thousand pounds in the year, are disbursed by the Lord Chamberlain, and voted in the annual grants for the Civil List. For collectors and for collections the Admiralty or the Treasury have supplied the expenses. Thus three, if not four, various departments have contributed, each to an indefinite extent, towards this establishment. Sir Joseph Banks, in his time, also sacrificed large sums towards the advancement of the Gardens, and, besides, many private individuals have added considerably to the collection. That so confused a system should have led to so favourable a result as these gardens, with all their imperfections on their head, still exhibit, is, in our opinion, a matter of great credit to the parties who have had the management of them. Yet much more than all this is expected in the present day from the first botanical garden in the empire, and more might easily be effected. Supposing, then, that the present annual expense be, in reality, though perhaps it cannot be accurately ascertained, in all about fifteen hundred pounds, we should ask for an annual sum of two thousand five hundred pounds, to be given independent of every other department, and solely for the benefit of the Botanic Garden. We would then have an additional cultivator, an adept in floriculture to supply the royal drawing-rooms with the choicest flowers; the ordinary ones can, no doubt, be obtained cheaper from nursery-men. We would appoint some one, ready and willing to keep up an active correspondence with other botanists, and whose duty it should be to exchange plants, to record the many botanical facts which must daily present themselves to the notice of so acute an observer as the present foreman is; and we would make arrangement to have these matters published, according to the custom elsewhere observed. We would enable those men about the grounds, who discover zeal and genius, to travel, that we might learn what is

going on in other places. It is ridiculous to assume that they who never move from their own specific locality can keep pace with the mighty progress of society at large, or of any individual branch of art or science; yet we believe there is not now a person in Kew Gardens who has ever been at Woburn or at Chatsworth, much less at Paris, Berlin, Munich, or Vienna! We would court the visits of strangers, and, by special invitation, procure the honour of an attendance from eminent men, and induce them to take notice, not only of our perfections but of our deficiencies: and for this purpose we would keep a book, in which they should enter their names, as well as their opinions of our proceedings. We would print such entries every month, and make the publication of a new catalogue of the plants, with a monthly or annual supplement, a *sine qua non* of pay or salary to some person about the Gardens. We would also hold out rewards to those who enriched our collection with new or superior specimens; there are plenty of people dispersed throughout the world ready to collect and to send plants, if they were but sure that there is a ready market for them in such an establishment. Finally, we would have a visiting committee of three gentlemen to guard against any relaxation of duty, any indifference to science, and any neglect of the objects for which the Gardens exist; and if they were chosen from amongst the high-minded and most zealous, of which there are so many in this great country, surely no fear need be entertained that they would not consider the care of the honour and dignity of this scientific establishment amongst the most paramount of their obligations! And this we would say above all, let every notion of exclusiveness, all illiberality, be dismissed; science is the reverse of it in all its bearings."

How far this counsel is likely to be followed we know not; but we are sure that much of it ought to be adopted.

Our late king set an example of affectionate regard for these Gardens, which we sincerely hope will make a strong impression upon his successors, and incline them to cherish Kew, royally and scientifically.

*Gatton Village-School.* By W. England. Small 8vo. pp. 64. London, 1840. Saunders and Otley.

ENGLAND (W.) expects every man to do his duty; and that he may know what that duty is, as regards education, he has here set forth the model of Gatton village-school; for Gatton, though no longer in schedule A., or B. either, politically, is undoubtedly, as we see from these pages, the first in the A. and B. system of instruction and the "march of mind." Education is a fruitful topic: every body has a crotchet of their own about it; and it is no easy matter to get any three persons to agree even upon the leading fundamental principles on which it ought to proceed, so as to produce the greatest benefit to mankind. For this, among other reasons, the *Literary Gazette* has generally avoided any elaborate views on the subject; being content, as also with respect to statistics, to note such facts as seem to offer grounds for building up sound practical systems, rather than dogmatizing on very partial and insulated data, of no value whatever, till they come to be classed and arranged for a useful purpose. How many cuffs seventeen naughty boys, and how many reprimands five naughty girls, receive at a Sunday or elementary school in three weeks, seems to us to be information of the most uninforming kind; nor do we care to be

told, as an element in the subsistence of the labouring classes, how many legs of mutton were hung in Leadenhall or Newgate markets, between Saturday the 4th, and Saturday the 11th of the month of March. The cuffs, the reprimands, and the legs of mutton, their numbers, severity, and weight, are, as far as we ever could calculate, perfect nonsense, either for inquiry or legislation; only that the last looks tolerably well in a *tabular* form.

But, with all this introduction, we are not really going to Gatton School at all; and if our readers are disappointed, we cannot help it. We have only put the head to our review, that we may select one extract, and tell one anecdote. The extract is in verse, and finely illustrative of the precepts and merit of the work; it occurs in the picture of a good nurse:—

"She took up a saucerpan and warmed it some pap,  
Then laid the poor baby at ease on her lap;  
She waited a while, just to cool the child's meat,  
And fed it exactly when at a right heat;  
She had asked a good neighbour what food was the best,  
And then fed the baby, and put it to rest.  
She knew that an infant that's forced to be fed,  
And can't have its milk when its mother is dead,  
Must suffer much pain, and be sickly at first;  
So she bore with its crying, and tenderly nursed,  
Saying, 'Poor little darling! how sorry am I,  
That you suffer so much, dear, and bye, baby, bye!'  
In its clothes she took care not to put any pin,  
For fear of its pricking the babe's tender skin,  
But sewed on a tape that would do just as well;  
For she feared pricking pins, as I'm going to tell.  
She heard that when infants so constantly cry,  
It is pain that they feel, and can't tell you why,  
Or else that they're wet, when they ought to be dry."

The simplicity and nature of this cannot well be surpassed; and we only leave our panegyric upon it for our promised anecdote, which pertains to the School of Socialism in Great Queen Street. A lukewarm disciple was there reproached with his coldness in the cause, till he at last confessed that he was, in his heart, only half an Owenite. "Half an Owenite!" (cried his catechist): what do you mean by half an Owenite?" "Why," replied the other, "I mean that I am perfectly ready to go half way in the doctrines of Socialism; and as far as other people's sisters, and daughters, and wives are concerned, I don't see why they may not be quite right; but I object to the other half; for I can't relish the idea that any body should make free with any of my female relations, and, as I have no daughters old enough, particularly with my sisters or my wife!"

#### MISCELLANEOUS.

*The Ladies' Flower Garden of Ornamental Annuals.* By Mrs. Loudon. No. XVI. London, 1840. Smith.

THIS number completes Mrs. Loudon's very beautiful work on ornamental annuals, which, when suitably bound, will form a perennial and elegant volume to adorn the table of every lady in the land, while it informs them how to cultivate these lovely flowers still further to please the sense wherever they are disposed. Forty-eight charming plates embellish this garden of sweets, in which three hundred and ten plants are naturally figured and coloured. In the list we are glad to see both the scientific and the common names given; for Botany is so dignified and learned in her nomenclature, that no poor scholar can remember the title of her Greek and grotesque compounds. In the very last plate we have varieties of centaury and gentian; but their titles are also *erythraea, ericala, and curylthalia!* A valuable glossary

— In No. XV. which we have not previously noticed, the *Linnæa* of various kinds, *Broomfield, Nicotiana*, &c. &c., are its embellishments, and they are executed with rare fidelity and grace. We have expressed our sorrow for the close of these flowers; but it is a pleasure to find that a similar series of bulbs are announced to open under the same skilful hands and treatment.

is, under these circumstances, one of the greatest recommendations of the book; and we feel much indebted to the accomplished authoress for it, and for a good index, to finish her whole task in the most satisfactory manner.

*Drawing-Room Botany.* By James H. Fennell. With Illustrations by Mrs. E. E. Perkins. 8vo. pp. 32. London, 1840. Thomas.

THIS volume is prettily illustrated, with no fewer than eighteen coloured plates, at once very simple, natural, and instructive to the botanical student or amateur. It is also quite a lady's book, gratifying alike to the eye and mind, and containing the elements of the science, together with the characters and uses of the plants, and the functions necessary to their development, ingeniously compressed within a very small compass. We have only to add, that the text is amusingly relieved by apt quotations relating to the subject-matter described.

*The Beauty of the Heavens, &c.* By C. F. Blunt. London, 1840. Whithead and Co.; Ackermann and Co.; C. Tilt.

THIS is an excellent publication to invite the young to the study of astronomy and observation of the starry firmament in the most agreeable way. Picture makes the strongest impression on the ductile mind; and we have here above a hundred coloured scenes of celestial phenomena of every kind, by the aid of which all the northern "beauties of the heavens" may themselves be scanned; and when the actual planet, or star, or constellation, or moon, or comet, &c., has been contemplated, by turning to these representations of them, and the text explanation of their nature and appearances, the whole system is made familiar to the understanding and fixed on the memory. Such modes of instruction are as delightful as they are useful; and we can truly recommend this handsome work to the favour of the public, and particularly of parents and teachers.

*The Indicator, and The Companion; a Miscellany for the Fields and the Fireside.* By Leigh Hunt. 8vo. 2 parts, double columns. London, 1840. Moxon.

WE rejoice to see this work, so honourable to the various talent of its author, in a form so very cheap and accessible. A more pleasing and graceful specimen of that polite literature which touches on many topics of interest, and interests us with them all, could not be laid on the table of the reading-closet or boudoir. It is just the book to recreate the mind for an hour when fatigue or lassitude require a change.

Part I. of Captain Basil Hall's *Journal on the Coasts of Chili, Peru, and Mexico*, is another example of the same popular form by the same publisher: to whom we are also indebted for Parts III. and IV. of "Southey's Edition of Beaumont and Fletcher," in a similar shape and equally low in price: and Rogers's *Italy* to boot.

*The New Annual Army List, with an Index, Corrected to 7th February, 1840.* By Lieut. H. G. Hart, 49th Regiment. 8vo. pp. 527. London, 1840. Murray.

A VERY complete work, and so well arranged, that we presume it must contain every matter of reference which the service requires. What alterations the late Report of the Naval and Military Commission may lead to, we are not competent to say.

*Indian Life. A Tale of the Carnatic.* By Mrs. Colonel Hartley. 3 vols. London, 1840. Saunders and Otley.

OF a romantic nature, and rather strange in style, we can say little in favour of the Indian

life unfolded in these volumes. Persons come and go in them, and there is a sort of mysticism in the sentiments, held in countenance by the modes of expression, that we confess has not had the power to attract us very strongly to the work. We therefore leave it to readers who have more patience and leisure.

*The Literary World.* Vol. II. Conducted by John Timbs. (London, Berger.)—The second volume of this pleasing and amusing miscellany well justifies the patronage which has attended the editor's diligence and efforts. It is numerously embellished, and full of excellent matter of every kind.

*Ase!, and Sæca. Poems from the Swedish of Elias Tegner,* by Oscar Baker. 8vo. pp. 92. (London, Carpenter.)—These compositions, at least in their translations, are more peculiar than poetical; and can hardly hope for much distinction amid the mass of publication.

*The Peninsular Magazine, No. I.* (London, Ackermann and Co.)—The editor (Dr. de Lazen) has adventured on a novel task:—to give us a magazine devoted to Spanish history, romances, and general literature. We shall wait for its continuance before we can express an opinion. An account of the Fueros, and a good tale, occur in this opening number.

*On the Philosophy of Temperance, and the Physical Causes of Moral Sadness,* by W. Moore Wooler, Surgeon, Derby. Part I. 8vo. pp. 101. (London, Simpkin, Marshall, and Co.)—Mr. Wooler is a strenuous advocate for temperance. Father Matthew himself is not more so. There is an earnestness in his exhortations which would command respect, even if he were quixotic in his ideas.

*The Voice of Conscience: a Narrative founded on Fact,* by Mrs. Quentin Kennedy. Pp. 310. (London, Fisher, Son, and Co.)—*The Voice of Conscience* has a good deal of the Voice of Intolerance in its accents. The narrative is founded on a statement of Mr. Carne's in his "Letters on Ireland" ("New Monthly Magazine"), and Mrs. Kennedy has expanded and dressed it up with the excellent intention of inculcating moral and religious principles.

*Biblical Topography: Lectures on the Position and Character of the Places mentioned in the Holy Scriptures, with Maps,* by S. Ransom. A Preface by J. Harris, D.D. Pp. 460. (London, T. Ward.)—A very useful compilation and book of reference for historical and geographical matter in connexion with the Bible.

*G. B. Childs, Esq., on the Female Figure.* Pp. 188. (London, Harvey and Darton.)—A treatise on the lateral curvature of the spine, and recommending a couch of a particular construction as a remedy.

*Jephthah; or, the Maid of Gilead.* Pp. 207. (Edinburgh, Johnstone.)—A story wrought upon Jephthah's rash vow, in which the manners and feelings of the ancient Israelites are set forth in a poetical and ornate style.

*A New Introduction to the Mathematics.* 8vo. pp. 235. (London, Whittaker.)—The writer disapproves of the usual method of teaching mathematics, and by reversing the order of instruction in some points, and particularly as regards arithmetic, thinks that he has improved the system.

*The Guide to Service: the Groom.* Pp. 216. (London, Knight and Co.)—One of the series which, while it instructs servants, may occasionally throw a little light in upon the brains of masters. In this latter respect the groom might, perhaps, have been more communicative.

## ARTS AND SCIENCES.

### CAPTAIN ROSS'S EXPEDITION.

[We have great pleasure in giving the earliest intelligence of this most interesting Expedition.]

LETTERS have been received from the Antarctic Expedition, dated from St. Helena the beginning of February. Lieut. Leffroy, of the Royal Artillery, who is to conduct the magnetic observatory on that island, had been landed with his instruments and assistants, and occupied Napoleon Buonaparte's house at Longwood, which has been assigned as his residence, and in the neighbourhood of which his observatory is to be built. From St. Helena, Captain Ross proceeds to the Cape of Good Hope, to establish Lieut. Eardley Wilmot, R.A. and his party in a similar observatory, where corresponding observations are to be made during the three years in which the Expedition will remain in the southern hemisphere. We understand that, by adopting proper precautions, the officers succeeded in making magnetic observations at sea with as much precision as on land, the two ships sometimes telegraphing to each other the same minute of dip. The importance of this success towards the prosecution of the objects of the voyage will be estimated, when it is considered how large a por-

tion of the southern hemisphere is covered by the sea. Captain Ross obtained soundings in the middle of the Atlantic Ocean, and far distant from any land, with a line of 2500 fathoms; being, we believe, by far the greatest depth that has ever been reached by a sounding line.

### ROYAL GEOGRAPHICAL SOCIETY.

APRIL 13. Mr. Greenough, President, in the chair.—Professor K. E. von Baer, of St. Petersburg, was elected a Foreign Corresponding Member. Extracts from the following letters and papers were read:—1. 'From Baron Cetto, offering to the Society, in the name of the King of Bavaria, 78 sheets of the "Topographic Atlas," of that kingdom, to be completed in 100 sheets on the scale of 50,000, or 1·5 inches to a mile, together with Plans of Munich, Ratisbon, Augsburg, &c., and a model in relief, coloured according to nature of the country, from Constance and Frankfort on the west, to the Salsburg Lakes on the east, on the horizontal scale of 1:250,000 or six miles to an inch, and the vertical scale of 1:250,000 or 1000 yards to an inch; the whole admirably executed at the Bureau Topographique at Munich.—2. From Major Rawlinson at Bombay, 13th February, stating that he was to set out on the following morning for Kabul, by way of Kelat and Kandahar. "My passage down the Tigris," says the writer, "from Baghdad to Basrah, was very interesting to me, for I had thereby ocular verification of much that was before known to me only from report. The lower part of the Kerkha is still, however, involved in much mystery; the stream which falls into the Shât-ul-Arab just below Korna is not one-tenth of the volume of the rivers at Sûs; and the Had, which runs from the Tigris towards the Kerkha, is even of a large size. All my information leads me to believe in the existence of an immense lake, or khor, between Hawizah and Korna (laid down in my MS. map, sent to the Society last year), in which the waters of the Had and nine-tenths of those of the Kerkha are lost, or rather carried off by evaporation; and this remarkable physical feature has never appeared in any map yet published."—3. From M. Baer, at St. Petersburg, stating that, owing to M. Schrenk having quitted Yakutsk, he had to regret the delay of a series of experiments, instituted by the Academy of Sciences, to ascertain the exact increase of temperature in a well at that place, in which the ground had been found frozen at a depth of 380 feet; but that as soon as a competent observer should be found to reside in that part of Siberia, the observations would be continued under the directions of the Academy. M. Baer also mentioned that a zealous young botanist, Mr. Schrenk, had just set out in the service of the Botanic Garden at St. Petersburg to cross through the most southern parts of Siberia, explore Kamtschatka and California, and probably return by Mexico. The geography of plants was his chief object, but Mr. Schrenk was also to pay much attention to ethnography.—4. From Colonel Gawler, dated Adelaide, South Australia, 19th October, 1839, communicated by the South Australian Commissioners. This letter states that Mr. Eyre, already well known by his travels in that district, had been sent by the governor to examine Streaky Bay, about sixty miles to the westward, and where there seemed a probability of a river being found. Quitting Port Lincoln on the western shore of Spencer's Gulf, on the 5th August, Mr. Eyre travelled to the north-west for fifty-five miles, when he

reached Cape Bauer, the south-eastern point of Streaky Bay; here the scrub had become so thick that he left his horse-team and rode to Point Bell, twenty miles further. On the 15th September the small vessel which was to have been sent for him not having arrived, he formed the enterprising resolution of going direct across in an easterly direction, from Cape Bauer to the head of Spencer Gulf; on reaching which he turned to the northward, along the western side of Flinders' range, and thence returned, in a nearly direct course, to Adelaide. This journey has decided the valueless character of this peninsula: the country is low and undulating, but no streams or chain of ponds, few trees, the land scrubby and strong. A range of mountains, 2000 feet high, extends in an east and west direction, along to the northward of the line travelled by Mr. Eyre, of a red amygdaloid, bare, and without a tree; from this the view to the southward was extensive, and nothing seen to encourage expectation. The harbours of Streaky and Denial Bay excellent, but no rivers. The bed of the lake formerly seen by Mr. Eyre, thirty-five miles north of the head of Spencer's Gulf, proves to be really a lake; its northern extremity was not discovered, but it is believed to drain to the northward. On rounding the head of Spencer's Gulf to descend towards Adelaide, Mr. Eyre fell in with a good and well-watered country.

[To be concluded next week.]

### ROYAL INSTITUTION.

FRIDAY 10th.—Mr. Alexander Nasmyth 'On the Functions of the Mouth, and the Structure of Recent and Fossil Teeth.' Such was the title given to a most interesting and novel review of the vast scale of organic change, effected by the process of assimilation, of which the mouth is the primary and essential organ. Assimilation being used in the most extended sense of the term, denoting the act of converting by a vital process any thing whatever into the nature or substance of another being. So extensive a range was taken by Mr. Nasmyth, that an abstract, compatible with the limits of our journal of this season of the year, would fail to convey a tithe of the interest excited. And, moreover, independent of the restricted space, the absence of the numerous drawings, beautifully executed by a lady, Mrs. Holmes, and of the large collection of heads, teeth, &c. for illustration, would be felt, and cause any notice we could give to fall far short of the merits of the lecture. The subject is of universal interest, and we with pleasure refer our readers to Mr. Nasmyth's papers 'On the Structure of the Teeth,' 'On Epithelium,' and 'On the Structure of Fossil Teeth,' read at the British Association at Birmingham and reported at length in *Literary Gazette*, No. 1183, for an account of that gentleman's valuable microscopical investigations and important discoveries in this branch of anatomical science. They comprise two divisions of the lecture on Friday evening, that is to say, the subject-matter then delivered, divested of the technicalities of the elaborate essay. To the other division, therefore—the functions of the mouth—we confine our present notice. The digestive cavities of animals, Mr. Nasmyth observed, resemble chemical crucibles, for the elaboration of the animal matter, requisite for the growth and support of the organic frame. The mouth is the simplest form of the digestive apparatus. This apparatus, even in its most perfect form, may indeed be regarded as merely a complicated extension of the cavity of the mouth;

and in its simplest form it comprises nothing more than a rudiment of the latter. From the monad up to man, the mouth is an essential organ. An orifice or orifices for the introduction of food must exist; and these, whether they are found singly or in numbers in any animal, cannot but be regarded as the mouth. In the lowest forms of animal being, life comprises little else than the exercise of the function of the mouth, which is sometimes an organ both for the reception of food, and for the expulsion of that portion of it which cannot be assimilated. The mouth, therefore, is the most universal and essential element of animal existence; the broadest, most constant, and most comprehensive expression of animal life; by its development and modifications throughout the animal kingdom, all the manifold, complex, and wonderful forms of organic nature are reared up and supported; and by its operation alone can means be instituted for the exercise of the *moral and intellectual faculties*. In surveying the expanse of nature, we find that every element, every climate, and every situation, has its appropriate inhabitants, in which the whole of the complex organs of assimilation are most wonderfully and wisely modified, according to the peculiar wants and position of the animal; and in the modifications of all these organs, the adaptation of the mouth to the performance of its particular functions is the most surprising and evident; and even in the lowest classes of animals, the different forms of the organisation of the mouth are as peculiar to their respective species, as strictly adapted to the particular requisitions of the individual, and as typical of the whole system of the animal, as in the highest. The simplest process of *nutrition* is that of some zoophytes, whose bodies may be called an homogeneous globule of animal matter, with an orifice for the reception of food; which, on being swallowed, dissolves, and becomes in a short time identified with the surrounding substance. Then, in other animals, of a somewhat higher grade, we have a *distinct stomach*, with canals leading from it. The next step is the superaddition of organs of *respiration*, which assist assimilation and nutrition by bringing the external air to act upon the liquid aliment, after it has been absorbed into the blood. Another step in the progress of the animal structure towards the perfection which it reaches in man, is constituted by its being provided with a *heart and lymphatic vessels*. Finally, we arrive at the *vertebrated* classes, so called from their possessing a backbone, or *vertebræ*, serving as a fulcrum, or support, to the whole frame in these animals, amongst which man is included. The sphere of action being much enlarged, the process of nutrition, and of course also the organs by which it is effected, are much more complicated than in any of the preceding classes; but in the four orders of *vertebrata*, viz. *fishes*, *reptiles*, *birds*, and *mammalia*, no decidedly peculiar diversities are presented with respect to the function of assimilation, which in all of them may be said to be carried on by similar means. The mouth and teeth of *aquatic* and *amphibious animals*, which live by preying on others, present a general character in beautiful harmony with their peculiar requisitions, being so modified, as to enable them to seize, hold, and divide the bodies of their slippery prey. Of this, the mouths of the *dolphin*, *crocodile*, *shark*, and *lepisosteus*, are good examples. One can hardly conceive the possibility of escape from jaws furnished with teeth of that nature. The presence of weapons such as these indicate that the prey of these animals must occasionally

be formidable, and capable of desperate resistance. The teeth of crocodiles and sharks are so often broken and destroyed in the encounter, that Nature, with admirable foresight, has sent them into the world provided with many successive and complete sets of teeth, which may be brought into use as required. In some *fishes*, as the individual advances in age the teeth become ankylosed, or fixed firm and immovable to the bone of the jaw, rendering it impossible to sever them by the rough encounters to which they are subject. In the mouths of pikes, of all kinds, this is frequently the case, and examples are easily obtained. Active habits in the animal imply rapidity of respiration, and are accompanied by activity and energy in all the other departments of the function of assimilation. A beautiful harmony may indeed be demonstrated to exist between the construction of the mouth and the habits and character of the species, throughout the entire range of every division of the animal kingdom. The truth of this may be well demonstrated, even in individuals of the *human species*. A well-developed mouth, furnished with strong and powerful teeth, capable of perfecting and performing the function of mastication, introduces the food into the stomach well prepared for complete digestion; and of course accelerates that process, which thus duly nourishes the system, and obviates all redundancy and oppression. The individual is thus not only supported, but stimulated to activity, and preserved in health. Where the mouth is strongly furnished, and healthy, the osseous system is also well knit, and the chest is well developed; all in consequence of the activity induced by the due performance of the function of digestion. In all these arrangements we trace with admiration the hand of a *benign Artificer*! In man we observe no manifestation of extreme activity and endurance on the one hand, or of sluggishness on the other, which respectively characterise the different orders of lower animals; but in him are concentrated all the faculties which are distributed in various degrees to the other species, and they are so balanced and regulated in him, as to produce the most complete harmony, and the most extensive range of action. The necessity of complete physical organs specially designed for offence and defence is superseded by the superiority of his rational faculties, by the exertion of which he ascertains that which others learn from mere instinct, and effects that which they can only effect by mere physical force. To his physical development and well-being no organ promotes and contributes so efficiently as the mouth, whether we regard it as the porch of nutritious assimilation, or as the organ of voice, and means of rational communication. Man has been said "to fulfil his destiny by means of his hand;" but Mr. Nasmyth considers that his mouth fulfils a still more essential part in the Animal and Intellectual life; for it is not only in him, in common with all other animals, the essential and original element of the apparatus of assimilation, by which his physical frame is built up from materials supplied by surrounding nature, but it is also the organ of intellectual expression, without which he would not be able to take a single step in his mental career, but would remain lower in the scale of creation than the brute which has instinct for its constant guide. It is a remarkable fact, that no other conformation of mouth than that of man could admit at once of perfect articulation and of a proper mastication of food. There is a most exalted contrast, and at the same time an evident fitness, in the circumstance, that the same Organ which

is the instrument in the hands of the *Almighty* to build up the wondrous and upright structure of *His own Image*, is the very one he has chosen to sound his praises, and make him known on earth. Thus did Mr. Nasmyth ably treat the "Functions of the Mouth." Similar ability was displayed in his elucidation of the other divisions of the subject.

## ELECTRICAL SOCIETY.

TUESDAY 7th.—Read a paper, by Mr. Gassiot, 'On the Coloured Rings obtained on Platinum Plate by means of the Gymnotus.' By the experiments of Mr. Gassiot, another link has been added to the chain of evidence in support of the identity of animal with voltaic electricity. The metalochromes, or coloured rings, produced by the action of the voltaic battery, have been obtained by the animal exertion of the gymnotus, or electrical eel. We have so recently described the details of the former process, contained in a previous paper of Mr. Gassiot's, read to the Electrical Society, that it will be unnecessary now to enter into the elucidation of the phenomenon, or to enlarge upon the beauty of the effect produced by the deposition of the oxide of lead on the metallic surface of a positive electrode immersed in a solution of acetate of lead. The same result has been obtained by means of the gymnotus in the following manner:—A small plate of platinum was attached to the end of a copper wire, and placed in a solution of acetate of lead, the point of another wire was brought to within one-eighth or one-sixteenth of an inch of the platinum plate; connexion was then made with the gymnotus by means of the two wires—the one attached to the platinum plate being connected with the head, and the other with the tail, of the eel. The colours immediately appeared on the plate, and minute particles of the lead could, with the assistance of a lens, be plainly perceived on the end of the wire forming the *negative* electrode. This experiment is highly satisfactory, as an additional and weighty witness in this interesting inquiry; but one, and the crowning, proof is still wanting, and will be, in all probability, until the exertions of the Society for the importation of these creatures, as yet so unfortunately foiled, shall be attended with success. The investigation to which we allude is that suggested by Faraday; namely, the restoration of vital, or, perhaps, nervous energy, by means of electricity, when the gymnotus has become exhausted by repeated discharges of its electrical powers.—Read, also, a communication by Mr. Smee, 'On the Galvanic Properties of Metals, and on a New Chemo-Mechanical Battery.' The experiments and results obtained by Mr. Smee have been published by him in the "Philosophical Magazine" for the present month; examined, doubtless, by our scientific readers, and probably compared with the surprising powers of "Grove's Battery," described in our report of proceedings at the Royal Institution (*Literary Gazette*, No. 1209). We therefore leave these two recent inventions to their respective merits.—The last paper read was by Mr. Mason, describing an 'Improvement in the Precipitation of Metals,' which consists in making the medal in progress act as a battery for the formation of one in another jar. Those who have had any experience in the metallic precipitation of copper by a single pair of plates, will readily perceive the advantage gained by thus preventing the possibility of any portion of the sulphate of zinc becoming mixed with the sulphate of copper. The mixing which sometimes occurs when a single jar is used is

the cause of the brittle compound, separable with difficulty from the copperplate or mould, being precipitated, instead of a tough, flexible copper.

#### ROYAL ASTRONOMICAL SOCIETY.

AMONGST other papers, read, 1. a 'Note on an Arabic Globe belonging to the Society,' by Mr. R. W. Rothman, Foreign Secretary. The instrument in question is a small bronze globe, about six inches in diameter, brought some time ago from the East, having the positions of the principal stars marked by silver studs, with their Arabic names engraved; and the object of the present note is to point out the differences between the names of the stars as found on the globe and those given in the Catalogue of Ulugh Beg, with which, in general, the globe agrees, though in some instances the differences are worthy of notice. From the position of the colures, &c. it is inferred that the globe is not of ancient date; but it bears no mark indicative of the precise period of its construction.—2. 'Elements of Galle's Second Comet,' computed by M. Petersen, and communicated by Professor Schumacher.

Passage, 1840, March 12, 77822, M. T. Altona.

#### PARIS LETTER.

Academy of Sciences, April 14, 1840.

SITTING of April 6.—M. Arago, as secretary, read a note from M. Delarive, of Geneva, on the method of gilding metallic objects by means of the voltaic pile. This gentleman stated that he had commenced his experiments fifteen years ago; but that he had met with so little success in them that he had given them up, and had resumed them only on learning what M. Becquerel, of Brussels, was doing in the same line. He had lately attained to some very notable results, which were capable of still greater improvement. He employed a solution of chlorate of gold, as neutral as possible, and very much diluted (there being only five or ten milligrammes of gold per cubic centimetre of the solution), which was poured into a cylindrical bag of bladder. This bag was then placed in a bottle of water very slightly acidulated. The article to be gilt is made to communicate, by means of a metallic wire, with a plate of zinc plunged into the acidulated water, and is placed itself in the solution of gold. The acidulated water may be put in the bottle, and the solution of gold in the bladder; the only object being to keep the liquids separate, without hindering the action of the electric current. After the lapse of one minute the article is taken out, and is wiped with a soft rag; and then being more strongly rubbed with rag, is found to be slightly gilt. After two or three similar immersions, the coating of gold is thick enough. The article should be well washed and polished before immersion; and should even be washed in slightly acidulated water between each immersion, in order to destroy any grease that may adhere to it. The colour of the gilding thus obtained is found to depend on various circumstances,—such as the purity of the gold, the nature of the objects to be gilt, and the degree of strength of the solution of gold; and, in order that the surface of the gold may be perfectly even, the surface of the article itself must be carefully polished. Great precautions are necessary in not allowing the object to be gilt to be put in contact with the solution of gold before every thing is so arranged that the

electric current may be established at the moment of contact. M. Delarive described this method of his as being very economical, since the quantity of gold required for the solution was very small. Thus, with a solution containing only 800 milligrammes of gold, he had solidly gilt ten silver teaspoons; so that if the ten spoons had entirely absorbed all the gold in the solution, which was not the case, each spoon would have absorbed to the value of only 32 centimes. A second gilding, coming over the first, gives it an unusual degree of solidity and durability.

A communication was read from M. Persoz on oxydised compounds of sulphur, in which he explained the process by which the hypo-sulphuric acid might be isolated.

A note was read from M. Zinin, professor of chemistry at Kasan, in Tartary, upon various products obtained with the essential oil of sweet almonds.

M. Cauchy presented the Academy with the seventh and eighth numbers of his Analytical and Physico-mathematical Exercises; and also a new memoir, entitled "A new and simple Method of completely Determining the alternate Sums of the primitive Roots of Binomial Equations."

M. Segurier read to the Academy an account of a new machine for the reduction of statues, bas-reliefs, &c., invented by M. Sauvage. It consisted in a simple application of the pantograph; and a kind of artificial finger attached to it worked the wet clay of the model with great facility. It was expected to become applicable to the making of small models for jewellers' work.

M. Puisseant expressed his opinion that M. Filhon had arrived at some of his conclusions, relative to the difference of level in the sea of the Channel and the sea on the west coast of France, too hastily. He had probably not taken into account the state of the wind, nor had based his calculations on a sufficiently extensive series of observations. M. Arago thought that the only fair inductions as to the level were to be attained from a very long series of observations; but M. Filhon's observations had been least numerous exactly at one of the principal points, Cancale.

M. Robiquet communicated the result of some observations which M. Flourens had instructed him to make as to the substance contained in madder dye, which most affected the bones of animals. He found that it was what is called the *purpurine* of madder, not the *alixarine*, which attacked the more bony parts of the skeletons of birds, &c.

We may mention that no further communication has been made to the Academy relative to the assertion of M. de Pontécoulant, that an important error existed in the measuring of the arc of the meridian.

The statement in the *Literary Gazette* of 28th ult. concerning a new steam-engine has produced a letter from M. Schmeltz, of Abbeville, to M. Arago, in which he contends for a claim to priority of invention of the same principle. M. Pelletan, of the Academy of Sciences, has also stated that he tried a similar machine at Cherbourg in 1832, acting on precisely the same principle; but that he found it a failure, not having been able to attain a greater speed than from four to five knots per hour.

*Académie des Sciences, Morales, et Politiques.*—At the last meeting of this body, M. Rossi in the chair, notice was given of the members who had been selected in conformity to an ordonnance of the Minister of Public Instruction to draw up a report on the history of moral and political science from 1789 to 1840. In

the section of Philosophy, the Minister of Public Instruction, M. Cousin, was himself chosen; though it was said that the duties of his political office would hardly allow him to accept of the nomination.—In that of Political Economy, the President, M. Rossi, was selected; in that of History, M. Mignet; in that of Morals, M. de Tocqueville.—No nomination had yet been made in that of Legislation.

M. Blanqui read a memoir on the life and labours of Mr. Huskisson, on whom he passed a warm panegyric, taking occasion at the same time to advocate the principal points of the free-trade system.

M. Moreau de Jonnés read an *exposé historique* of the various attempts made in France, since the seventeenth century, to obtain accurate statistical returns of the condition of agriculture. He shewed that most of the returns that had been made were erroneous, from having been founded on too general results, and depending too much on averages. A new system, of much more accurate inquiries, he said, had been going on for the last four years, and, ere long, would be laid before the public.

*Académie de Médecine.* Sitting of 7th April.—M. Ferrus read an eulogium upon the late Dr. Bieth.—M. Bousquet communicated to the Academy the contents of the forthcoming volume of its "Transactions." It will contain 1. A Memoir by M. Orfila on Poisoning by Arsenic; 2. M. Pelletan on Consumption; 3. M. Baillarger on Cerebral Convulsions; 4. M. Foville on *Méningite*; 5. M. Lecanu's Analysis of Urine.—At this sitting, M. Chervin read an elaborate memoir on an interesting case of aneurism of the pectoral aorta, drawn up by M. Follet, head medical officer of the Marine Hospital in the island of Bourbon.—M. Chevalier communicated an account of two cases of poisoning, in the detection of which M. Orfila's theories and practice had been completely confirmed.—M. Leroy d'Etiolles presented the Academy with a long memoir on diseases of the prostate gland, accompanied by numerous preparations.

*The Royal Academy of Sciences at Turin*, class of Physics and Mathematics, held a sitting on 5th April. A report was given by Professor Gené of the transactions of the class during 1839.—Professor Botto commenced the reading of a memoir, in French, 'On Microscopic Observations upon the Movements of Vegetable Globules in a Menstruum.'—M. Michelotti read part of a paper 'On Literal Analysis.'

*Books.*—The magnificent publication of M. Texier, "Description de l'Asie Mineure," is now at its 7th livraison. The king has subscribed to it for all his libraries.—The last number of the "Aguado Gallery," publishing by M. Gavard, the author of the immense work on Versailles, contains the fine "Annunciation" by Murillo, which is one of the principal gems of that collection. The engraver's department of this sumptuous work is very well conducted.—M. Leguével de Lacombe has given us an important book upon Madagascar. He treats of the recent revolutions of that island, the attempts of the English to settle on it, the rapid progress of the Malgachos in civilisation, the varied appearance of the tribes occupying the island, and adds a comprehensive account of its national productions. The work is entitled, "Voyage à Madagascar."—The geographical cabinet of the Bibliothèque Royale is found to be productive of much good; though it has been only recently established, a precious collection of geographical works is

forming in it. At the last meeting of the Geographical Society, a warm eulogium was paid to the administrators for forming this cabinet.

We mentioned last week that Mlle. Rachel had just settled the terms of her new engagement at the Théâtre Français; Mlle. Mars has now done the same, but not on such extravagant terms: her star is on the wane! She is to receive 30,000 francs per annum salary, with 1200 francs for her *feur*. Mlle. Doze, a most meritorious young actress, is to have 5000 francs a-year. M. Leguay, the oldest painter of the porcelain manufactory of Sevres, died there the other day, aged seventy-eight.

*Sciarada.*  
Primo, Son cantato;  
Secundo, Son mandato;  
Intero, Son mangiato.

Answer to the last:—Te-la.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—United Service, 9 P.M.; Medical, 8 P.M.; Statistical, 8 P.M.  
Tuesday.—Linnean, 8 P.M.; Horticultural, 3 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
Wednesday.—Society of Arts, 7½ P.M.  
Thursday.—Antiquaries (Anniversary), 2 P.M.  
Saturday.—Westminster Medical, 8 P.M.

#### FINE ARTS.

##### NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

[Second notice.]

201. *The Canterbury Pilgrims*. E. Corbould.—Battles, sieges, tournaments, or tempests, may serve to exhibit the skill of the painter: they may do more—they may teach us to set a value on our own safety, or unacknowledged comforts; but, for our own part, we like the sunshine of art when so happily displayed as in the above performance. Those who remember Mr. Corbould's picture from "Anne of Gierstein," a scene in the "Hostelry of the Flying Stag," may form some idea of the *Canterbury Pilgrims*—the subject under notice. Here is the same animating bustle, the same picturesque character of costume and building, the same glow of brilliant colouring, the same highly-finished execution. A pretty long quotation from Chaucer, in the Catalogue, points at, rather than points out, the characters. The principal groups in the picture are the warrior knight, already mounted on his charger, conferring with an attendant, or groom; and the young squire, yet seated, and carrying on a flirtation with a maid of the inn and another female of a higher grade. Jokes, gibes, and good liquor, seem circulating among the lower order, making up a whole full of the liveliest contrasts. Chaucer is also introduced in a corner of the picture, keenly observing all that is taking place.

139. *Ibrahim Bey, with Two of his confidential Officers, resting in the Nubian Desert, in their Flight before the Troops sent against them by Mohammed Alee in 1812*. Henry Warren.—Here is sunlight enough, but it is the sunlit desert—awful and sublime. It must have tasked the powers of the painter to give effect to so dreary a prospect; but Mr. Warren has peopled the scene with so much of splendour and variety, both in costume and in character, that no monotony in the boundless waste is felt in viewing the performance. The habits of the fugitives are in strict conformity with their tribe and country, and are executed with a skill and fidelity calculated to attract attention and to excite admiration. We are much gratified to learn that this fine drawing has been purchased

by Mr. Vernon, who is unquestionably entitled to the honour of being the most liberal and judicious encourager of modern art in the country.

122. *A Scene at the Gate of the Convent of San Geronymo, at Belein, Lisbon*. L. Haghe.—The artist's name is, we feel assured, a guarantee for any commendations we can bestow on his works. In the subject before us, Mr. Haghe appears to have taken a new ground in the style and manner of his performance. His picture of last year appeared to us to partake of the Flemish school; this has some of the Italian. Be that as it may, the subject is of great interest, and the style and treatment are no less attractive than in his former work. The scene exhibits the richly-wrought and sculptured entrance of the convent, and the monks in the act of distributing alms to the pilgrims and mendicants applying for relief. It is a deed of mercy, in the performance of which Religion appears in one of its most attractive features. The figures and groups are varied in character, and in every way suitable to the occasion. They excite pity on the one hand; and, on the other, admiration of the skill of the artist by whom they have been so ably depicted.

155. *The Death of Titian*. W. H. Kearney.—'Tis a sad story, "pitiful, wondrous pitiful," as related in the quotation following the title of the subject. The artist has illustrated the atrocious circumstances connected with the event in a way that does credit to his talents in the executive portion of his task; the materials it afforded him are in the highest degree striking and picturesque: a richly-decorated apartment, plate, furniture, money, and other accessories, seized by ruffians before the eyes of the dying painter and his beloved son.—'Tis a sad story, tell it as you will.

189. *Dutch Fishing-boats, riding out a Gale off the Dogger Bank*. E. Duncan.—Had such a scene passed before our un-sailored sight, we should have said of the boat nearest the eye, "The thing is impossible! it cannot be done! Why, her head is plunged deep into the wave, and her rudder is out of the water!" But perhaps an adept like Mr. Duncan would say to us, "There are more things done in wind and wave than are dreamt of in your philosophy." So we give it up, and only congratulate the painter on his successful representation of such a tremendous scene, and express our hope and wish that the performance will find a harbour in the collection of some worthy encourager of modern art.

[To be continued.]

#### THE FRENCH SCHOOL OF ART. *The Louvre: Salon of 1840.*

[Fourth Notice.]

THERE is a most laborious artist, M. Meissonier, one of the hardest-working men in Paris, who has produced a little gem for this Exhibition, something in the Gerard Dow style: he entitles it "The Reader," and it represents a comfortable old gentleman buried in his study poring over his books, and all around him in an agreeable state of literary confusion. A warm afternoon's sun throws a glowing light on every object. It is of very small dimensions—not more than ten inches by six, and is finished, not only with exquisite minuteness, but with astonishing boldness and precision of handling. Were it a little more transparent, the effect would be quite equal to a genuine Gerard Dow. The artist must have spent at least six months on this picture—so his friends say; and supposing that he sells it for 1500*l.* or 1800*l.* his remuneration will be very inadequate. Every body admires his industry and regrets the immense consumption of time.—Clement Bon-

langer, who is a warm admirer of the rich schools of Italy, and by no means an unworthy disciple of the older masters, has chosen a good subject in a marble staircase and portico of the Vatican, at the foot of which Pope Sixtus V., accompanied by some cardinals, is receiving his peasant relations. The artist has thrown considerable depth of shadow into all parts of the composition except the principal group, relieving the dark parts by rich tints of marble, of armour, of draperies, &c.; while the scarlet robes of the cardinals and the purple cope of his holiness, strongly lighted up, give uncommon effect and spirit to the whole. This artist has several other pictures in the *salon*, but they are not of the same merit.—The celebrated Tony Johannot has finished a small picture, commenced by his deceased brother Alfred, representing the well-known story of Sir Walter Raleigh spreading his mantle for Queen Elizabeth: but it is not treated with the spirit that Johannot usually infuses into whatever passes from his palette: it is good, of course; but that is all that can be said of it.—M. Jacquand has got a large and fine picture in the great square room of the Louvre, styled "L'Aveugle:" it represents an aged monk in his cell, receiving some heart-rending confession or other from a brother of the community. The confessor sits in holy tranquillity, meditating with prudence and charity on the terrible avowal which the penitent, whose hands are grasped in agony, and whose eyes are almost starting from their sockets, is making. The grey walls of the cell with a good deal of shade, and the brown dresses of the figures, are treated with much warmth and mellowness of effect, and the whole forms a striking picture. The artist has got two or three more productions in the *salon*; but they are small, and not so good as this one. It would appear as though he too had been idle during the past year, for we have nothing from him on the same scale as his "Gaston de Foix" of 1838, nor his splendid "Louis XI." of 1839. We may observe, *en passant*, that this latter picture is destined by the artist to appear in the Exhibition of the Royal Academy, in London, of this spring, previous to its being finally sent to Rotterdam, where we understand its fortunate possessor resides.\* There is an uncommonly good mezzotint engraving of it recently published; and the best water-colour of this present *salon* is a small copy of it by a lady.—A young French artist, who, from his name being Wattier, thinks himself bound to imitate Watteau, has distinguished himself this year by a very charming little group in the style of that master. It has afforded a contrast, but not to its own advantage we think, with the style of M. Diaz, another young painter of merit, who loves to delineate groups of Turkish ladies and wood nymphs playing under the shade of flowery bosquets on Persian carpets, and waited on now by negro girls, and now by Cupids. This gentleman has given us some splendid effects of accidental lights, such as are to be seen in woodland glades, and in which he contrasts the fair forms of his figures with the rich tint of foliage or drapery in an admirable manner.

Battle-pieces are very scanty this year, *Deo gratias!* We recollect when Versailles was finishing, the whole Louvre was one continual series of deathless deeds, and when there were

\* We are sorry to say that the application for its reception arrived in London far too late; and, notwithstanding the earnest wish of our Royal Academy to show every attention to foreign merit, it was quite impossible to exhibit this picture. In short, it is still in Paris, and the rooms in the National Gallery are more than half arranged.—Ed. L. G.

as many different wounds depicted within its walls as there are to be read of in all the *Iliad*. The only things at which any body stops this year are "The Battle of Hondschoote in 1793," by Bellangé—the English are being forced in their entrenchments, and are about to be what the French call *enfoncés*—and two daubs, entitled the "Battle of Toulouse," in which, with admirable historical propriety, the English are represented as running away at all points, and their Gallic adversaries, headed by the "Illustrious Sword," as that good-natured old fellow Soult is called, gaining a complete victory! We do not call them daubs on account of their subject, as many a wrathful Briton would be tempted to do, but because they are strictly and truly very poor works of art. The marine battles, too, are very inferior in point of merit this year. There is a sketchy "Bombardment of Genoa," by Gudin, and a large picture of the "Sinking of the Vengeur," by Morel-Fatio: both good; but this is all. A picture that is somewhat related to the class of naval battles, and yet cannot strictly be called such, but which we may appropriately notice here, is one by Lepoitierin, and is as fine a canvass as any that we have had the good fortune of falling in with for many years. During the 16th and 17th centuries, when the bucaniers were in the height of their glory in the New World, and when the Dutch, Spaniards, French, and English were wont to bang away at each other in good earnest in the seas of the old, there was a set of rascals always to be found whenever two great fleets came into collision, who used to keep a sharp lookout for all that fell overboard, and appropriate the same to their own benefit. If they met with any unfortunate sailor swimming for his life they kindly helped him into their boat, knocked his brains out, and pitched him over again into the sea. All stray spars, sails, &c. they fished in similar manner: in fact they were sea-robbers, and went by the current name of "Gueux de mer." Our artist has represented a ramshackle barge, full of gentry of this kind, cruising about in and between the lines of a Spanish and a Dutch fleet, which are launching at each other such volleys of thunder and lightning that none but desperadoes would choose to go near them. They have hoisted Dutch colours, having a shrewd guess that Mynheer will lick the Don. At the bows of the barge is a most villainous-cheeked fellow in a slouched hat, standing up, and keeping his watch ahead: at the stern is another, with a telescope at his eye: the captain sits at the helm: the men, in strange variety of costume—it is impossible to say what nation they belong to—are luddled together in the middle: the boat is heaving gently, and they are just keeping her head up to the wind with a couple of oars, ready to hoist their rugged sail and make a dart at the first prospect of booty. The grouping and design of this picture are quite wonderful, and the outline of the men in the boat is astonishingly clever: the colouring is rich and full of harmony, without glare—the sea transparent and natural; the handling firm, masterly: altogether, it is a first-rate production.

The French school is certainly not so rich in portrait-painters as that of England; whether it be caused by the absence of sufficiently liberal employers, or from artists being repugnant to the drudgery of that line and preferring to mount to glory by another road, we do not know: but the fact is positive. The most rising of the present class of portrait-painters, Charpentier, who proceeds upon excellent methods, and in some of his productions

might be said to be an imitator of Sir Joshua Reynolds, has painted a fine three-quarter likeness of Mlle. Rachel, the celebrated tragic actress, who is now all the vogue in Paris. The figure is represented standing, in black, without any ornament, the head slightly inclining forward, the eyes looking sternly and piercingly forward, the hands hanging down clasped together; the background, a brownish-greenish wall with strong shade: this forms a striking and very effective picture, treated in its carnations just as Sir Joshua would paint, for strength of handling, and full of power in its colouring. It rather flatters the lady; but this is very excusable, and is counterbalanced by the extreme simplicity of the composition. Another portrait, of nearly equal simplicity and singleness of design, has been sent in by M. Guignet, which is curious as a work of art. It represents a young, fair, and good-looking man, the face half averted, standing up against a table, dressed in a drab morning-coat, in an apartment the walls of which are in white and gold. There is little or no shade in the picture; and in this it resembles a bold but successful attempt made last year by M. Amaury Duval, who painted a lady in a rose-coloured dress against a white ground, without any shadow whatever. Portrait-painters will understand the difficulties of such proceedings, so rarely attempted; but in both instances they have been successful, solely, we conjecture, from the artists having strictly adhered to nature. In the present case, M. Guignet has produced an admirable effect, which is much heightened by the simplicity of the means taken to obtain it. We dwell on these instances as curious points in the practice of the modern French school; and we will add the remark, that in all cases the more simple the composition in a portrait the better. Vandyke cannot always be imitated safely; it is better to abide by Holbein, by Titian, and by Velasquez. M. Amaury Duval is a very powerful delineator of features, and always makes a bold striking likeness of whatever face he takes for his subject: he paints with remarkable firmness and solidity; is rather cold in his colours; and is one of the division of that school which sets all ancient precedent at defiance. He has some capital things in this year's *salon*, but they are not equal to the portraits of M. Flaminio, one of the favourite pupils of Ingres, the director of the Academy at Rome. Like all the productions of that master, the works of his scholars are correct and severe; perfect in drawing and light and shade, but with a peculiar greenness of shadow, and a curious coldness of colouring, that detracts much from the popularity to which works of such high merit would otherwise be raised. As for Dubufe, the last of the portrait-painters we shall notice, he has nine pictures in the *salon*, all of them done upon one and the same principle—a black velvet dress, short sleeves, large curls, a *moyen-âge* chair, a damask curtain; the likeness good but flattering, the flesh painted sign-board fashion, and the fair incognito designated in the Catalogue as the Duchess of —, the Countess of —, or the Princess of —!

#### BIOGRAPHY.

MR. JOHN BATE.

ON Thursday, the 9th instant, this gentleman, alike distinguished by his ingenuity and his worth, died at the early age of thirty-one years. He was the inventor of the *Anaglyptograph*, an instrument for tracing and representing upon plane surfaces a perfect resemblance of models in relief,—a subject much discussed in the *Literary Gazette* in the years 1836-7.

When applications having been made to parliament by a party of foreigners to engrave, by a process inaccurate, but otherwise similar to Mr. Bate's, the medals in the British Museum, we then claimed for our ingenious countryman the justice of employing his perfect instrument for the purpose, rather than the inferior contrivance of Nolte and Co.; and we mainly contributed towards saving our country the disgrace of employing foreigners to do that in a national work which Mr. John Bate, an Englishman, could so much better execute.

#### SKETCHES.

SOME accounts of the late strange occurrences at Damascus have found their way into the newspapers; but the following, for which we are obliged to a friend, being more particular, will be acceptable to our readers. The narratives remind us of the dark ages in Europe, and the charges which, in those days, led to Jewish massacres.

"I have just received my letters by the Indian mail. One of them brings me a most horrible story from Damascus, which, if my authority were not beyond all doubt, would appear almost incredible. It might furnish materials to Mr. Ainsworth for one of his melo-dramatic novels.

"You know—perhaps you don't though—the Jews in Syria have for some years past been suspected of human sacrifices. Persons of various ages have occasionally disappeared in a mysterious manner, and never been heard of again. The Mosliman and native Christians have always asserted that these persons were kidnapped by the Jews, and sacrificed; but the accusation never was credited by the European authorities, nor, I believe, by the governor of Damascus. It turns out to be too true. Padre Tomaso, whom you may perhaps remember at the head of the Latin convent, disappeared about the middle of February. He had left the convent with a servant, and it was ascertained that both of them had been seen in the Jews' quarter. Suspicion fell on the Jews, and several were arrested, and thrown into prison. One of them died without confessing any thing, after receiving 1500 blows with the koorbadj; but another, after getting about 1000, betrayed the whole plot. The poor priest and his servant had been inveigled into a house under pretence of visiting a sick person: they were seized by the wretches, who had every thing prepared; their feet were caught in a noose, and hoisted up to the roof: some of the Jews held their heads and hands, while the fellow who confessed cut their throats. When they had collected all the blood, and put it into bottles, to be used in some of the religious rites, the flesh was cut into small pieces, and the bones broken down, and the whole put into a number of bags, and thrown into a common sewer! The remains of the bodies have been found. While this fellow was under the bastinado, Signor Picciotto, a very rich Jew, stood by, offering him a hundred piastres for every blow he might bear without speaking. I had the disagreeable honour of knowing this infernal scoundrel, and he was several times in my house at Beyrout. He was a good-looking fellow, about five-and-thirty, and did not wear the distinguishing costume of the Jews, but was always very gaily dressed—quite an Oriental dandy. He and several other leading Jews were in prison when my correspondent wrote, undergoing the bastinado, to discover what was done with the blood. Is it not dreadful? What horrors superstition will lead men to perpetrate! Two of the chief Jews, who were seraffs (bankers),

have fled to Bagdad. The Christians are highly exasperated—so are the Mooslims, for that matter; and not a Jew dare appear abroad. Shereef Pacha has seized all their books, and the investigations are still going on. It's a beastly story, and makes my blood tingle to think that I have been drinking coffee, and smoking, and shaking hands, with this bloody miscreant.

"Ibrahim Pacha has taken a devout fit; eschews the brandy bottle; and not only prays five times a-day, but insists on all his officers doing the same."

**Royal Society Soirées.**—The last of these interesting evening meetings for this season, at the mansion of the noble President in Piccadilly, took place on Saturday, and was very brilliantly attended by individuals who might fairly be said to represent all the parties, ranks, sciences, and arts of the country. Amongst the company we observed the Archbishops of Canterbury and Dublin, and several of the bench of bishops; M. Guizot, the French Ambassador; a Parsee Master-shipbuilder from Bombay; the Duke of Buccleuch; Marquess of Westminster; Lords Shaftesbury, Haddington, Stuart de Rothsay, Strangford, Colborne, Montagu, Burghersh, Mahon; Sir R. Peel, Sir R. H. Inglis, Mr. Gally Knight, Mr. M. Milnes, and other members of parliament; Sirs Gore Ouseley, A. Johnston, H. Ellis, J. Rennie, &c.; Mr. Hallam, Mr. T. Hook, Mr. Hudson Gurney, Mr. Hamilton, Mr. Milman, Mr. Amyot, Mr. Macready, Mr. Babbage, Mr. Cartwright, Mr. Christie, Mr. G. Rennie, Messrs. T. and W. Tooke, Mr. D. Pollock, Mr. Gray, Mr. Halliwell, Mr. Britton, Mr. H. Horne; Mrs. Buckland, Copeland, Ure, A. T. Thomson, Arnott, Scudamore, Tweedie, &c.; Surgeon R. Liston; Colonel Sykes, Colonel Leake; Major Sabine; Captain Denham; Lieut. Holman (the blind traveller); and in the arts, Wilkie, Phillips, Pickersgill, Stanfield, Roberts, M'Clise, Wyon, Brockedon; and many others, equally distinguished in the cultivation of those pursuits which adorn and improve a nation. The affability and intelligence of their noble entertainer seemed to be communicated to the mass, and it was very gratifying to observe the frankness and absence of ceremony with which information was sought and given respecting the novelties to be seen in the rooms, as well as in the interchange of the courtesies of polite society. Among the matters exhibited were the admirable model of a lighthouse by Captain Denham; the model of a suspension-bridge, with a new application of the suspenders; many specimens of photogenic and daguerrotype productions (including a miniature portrait); a curious Chinese shirt, very like a fishing-net; and some artificial flowers beautifully executed. It was past midnight before the party broke up from the lower room, where wines, ices, coffee, tea, and other refreshments, were abundantly supplied; and we believe that there was but one sentiment on the occasion, after a grateful feeling to the noble host for the manner in which he has given these entertainments, viz. that if his popular example were followed by thirty or forty of our men of high station, patrons of science, arts, and literature, it would tend in no small degree to promote, not merely the social harmony which ought to exist among them, but the honour, prosperity, and exaltation of England.

#### THE DRAMA.

**Covent Garden.**—Yesterday week, Mr. Kemble closed his performances with *Hamlet*: we

had rather it had been something else. We (and we say so with humility) differ from this high authority in his idea and reading of the character, which we accordingly never thought one of his happiest conceptions. On Friday, it was graceful and polished; and in some parts, feeling and effective. But withal the play lagged heavily along; and, notwithstanding the panegyrics which we see so generally bestowed upon its representation by the press, we are disposed to believe that few of the audience were more than partially pleased when it ended, after more than three hours spent in the acting.

#### VARIETIES.

**Gothic Architecture.**—At a meeting of the Architectural Society of Oxford, a paper 'On Gothic Architecture' (as we see from the 'Cambridge Chronicle') was read by the Rev. W. Sewell, of Exeter College, which offered the following remarks, the force of which we think will be generally felt:—"He observed that no religious mind could hesitate for a moment in what style to build a church: in any other style our ideas could only be associated with theatres, or with heathen temples, while Gothic architecture we could associate with nothing but Christianity; and the more deeply we enter into it, the more we shall be impressed with the fervent piety and strong religious feeling of those who designed our Gothic churches. Every religion has had, and must necessarily have, an architecture of its own, impressed with its own character. Thus the Egyptian, the Greek, the Hindu, or the Chinese, each conveys to us the idea of the religion which it embodied; and in the same manner Gothic architecture is essentially Christian and Catholic in its true and proper sense—the errors and superfluities of Romanism are no more essential to it than they are to true Christianity. No one can enter into St. Paul's Cathedral with the same feelings with which he enters Westminster Abbey; nor will all the magnificence of St. Peter's at Rome impress the mind with the same mysterious sense of religious awe which is experienced in York Minster."

**Alexander Nasmyth, Esq.**—We have to record the death of this father of the Fine Arts in Scotland, who departed on the 10th inst., at a patriarchal age. He must have been nearly ninety years old, and was not only eminent himself, but the exemplar and teacher of many members of the Scottish School who have distinguished themselves as artists.

**The South London Horticultural Society,** at their first exhibition at the Horns Tavern, Kennington, on Thursday, had a very beautiful show of exotics. The early-forced azalias, auriculars, hyacinths, &c. &c., were magnificent. Mr. Coutts and Mr. Fairbairn obtained the large silver medals, and other competitors the smaller ones.

**The Eschequer Records.**—Some of these stray documents were on Wednesday submitted to sale by Mr. Leigh Sotheby. They were from the age of Henry VIII. to George III. and brought considerable prices—one order of Privy Council as much as 3l. 15s. An account of the charges for entertaining Rubens, February 1626, was among these curious relics.

**Railroad Speed.**—An experiment was tried a few days since on the railroad to Reading, with wheels of less diameter than hitherto, and for two miles the speed attained was at the rate of fifty-six miles an hour—nearly a mile per minute!!

**Roman Antiquities.**—Recently on removing a cairn, which looked like an accidental heap of stones, on the top of one of the Lammertmair

hills, a square trough of hewn stones was discovered, in which a number of terra cotta urns, filled with ashes, &c., were deposited. They are in perfect preservation, and indicate the spot of ancient Roman sepulture.

#### LITERARY NOVELTIES.

**Scenes in Italy.**—We hear that Mr. Brockedon has far advanced towards publication a series of views in this beautiful country: remarkable for their classical, historical, and picturesque interest. The subjects are selected from the portfolios and sketch-books of many artists and travellers, who have left to his choice, and confided to his care, the selection of such subjects as would suit his intended work. These will, of course, be acknowledged in the drawings for the engravers. The descriptions and superintendence are by Mr. Brockedon, whose work on the Alps, and others of the same genre, lead us to hope for a work of great popularity and interest, which will increase his already distinguished reputation in this class of publication. The work is to be engraved in line, and published in parts.

#### LIST OF NEW BOOKS.

On the 2d and three following days, clear; on the 6th and two following days, generally cloudy; rain fell on the 6th and 7th; a little hail fell at times during the 8th.

Rain fallen, '11 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

We have only time to notice, this holy and holiday week, the reception, at late hours, of "The Life and Correspondence of Sir S. Romilly," the autobiographical portion of which, contained in the first volume, we have perused with much interest;—the first part of Mr. John Wright's valuable contribution to our parliamentary history in Sir H. Cavendish's report of the debates of the hitherto unreported House, between May 1768, and June 1774;—Mr. J. Scott Bowerbank's first part of a great geological desideratum, viz. "A History of the Fossil Fruits and Seeds in the London Clay," with an immense number of engravings;—"The Maid's Husband;"—and we believe Mr. T. Hook's new novel of "Precept and Practice."

 John Lee, 440 West Strand.

## Just published, THE SHAKSPERE NOVELS.

### I. THE YOUTH OF SHAKSPERE.

3 vols. post 8vo.

"We hail 'The Youth of Shakspeare' as fulfilling all our hopes of the author. The various incidents which occurred in the infancy and youth of the bard are sketched with the pen of a master, and all the personages of the times are brought before us in vivid and excellent portraiture. We can only say that the wit, freshness, and historical adornments of these volumes, must gain for the author rich and honest praise. He need no longer keep his *incognito*. He may take his position in the front rank, where he may raffle it successfully with any writer of the present day."—*Age*.

### II. SHAKSPERE AND HIS FRIENDS.

By the same Author. 3 vols. post 8vo.

"Shakspeare, as he is here represented, realises the gentleness and purity which we naturally cling to as true attributes of his life."—*Monthly Chronicle*.

"This work is altogether a novelty—something original, both in style and manner. It gives us a familiar view of the times of Shakspeare, and introduces us to an intimate and personal acquaintance with the more remarkable characters of the period. Foremost among these we have Shakspeare himself, Elizabeth, Raleigh, the Earl of Essex, Ben Jonson, Burbage, &c.; all acting, moving, and speaking, as the author supposes they might have done when they lived. The work, in truth, is one altogether of singular merit. It is a beautiful fiction, finely conceived, and admirably wrought out."—*Spectator*.

HENRY COLBURN, PUBLISHER, 13 GREAT MARLBOROUGH STREET.

To be had of all Booksellers and at all the Libraries throughout the Kingdom.

#### NEW PUBLICATIONS.

I.  
**HOWITT'S RURAL LIFE of ENGLAND**. 2d edition, 1 vol. medium 8vo. uniform with "Visits to Remarkable Places," with Illustrations on Wood by Bewick and Williams. Price 8s. cloth.

 "An elegant and entertaining volume."—*Spectator*.

VIII.  
**TAXIDERMY; or, the Art of Collecting and Preparing Objects of Natural History**. 4th edition, 18mo. Plates, 7s. 6d.

IX.  
**A DICTIONARY of ARTS, MANUFACTURES, and MINES**. By Andrew Ure, M.D. F.R.S. &c. With upwards of 1800 Wood Engravings, 2l. 10s. cloth.  
 London: Longman, Orme, and Co.

f. cap 8vo. price 5s. cloth.  
**THE DUBLIN UNIVERSITY CALENDAR**, 1840. Corrected to Nov. 30, 1839.  
 Dublin: Milken and Son. London: Whittaker and Co.

THE LATE MAJOR RENNELL'S WORKS.  
 In 8vo. with a Series of Charts, price 2l. 2s. (dedicated, by special permission, to His late Majesty).

**AN INVESTIGATION of the CURRENTS of the ATLANTIC OCEAN**, and of those which prevail between the Indian Ocean and the Atlantic.  
 By the late Major JAMES RENNELL, F.R.S. Lond. and Edin.  
 Formerly Surveyor-General of Bengal.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Also, by the same Author,  
 1. **The Geographical System of Herodotus Examined and Explained**. New edition, in 3 vols. 8vo. with Maps and Portrait, 1l. 8s.

2. **A Treatise on the Comparative Geography of Western Asia**. In 3 vols. 8vo. 1l. 4s.; or with Atlas, 2l. 14s.

3. **Illustrations (chiefly Geographical) of the History of the Expedition of Cyrus from Sardis to Babylon, and the Retreat of the Ten Thousand Greeks from thence to Trebizond and Lydia**. With an Appendix, and Three Maps. 4to. 1l. 1s.

4. **Observations on the Topography of the Plain of Troy, and on the principal Objects within and around it, described or alluded to in the Iliad**. With a Map, 4to. 7s. 6d.

CAPTAIN BASIL HALL'S SOUTH AMERICA.  
 Price 2s. 6d. Part II. of  
**EXTRACTS from a JOURNAL** written on the Coasts of Chili, Peru, and Mexico, in 1820, 21, and 22.  
 By Capt. BASIL HALL, R.N.

Also,  
 1. **Voyage to Loo Choo**. Price 2s. 6d.  
 2. **Italy; a Poem**. By Samuel Rogers. Price 1s. 6d.  
 3. **Campbell's Poetical Works**. Price 2s. 6d.  
 Edward Moxon, Dover Street.

In 3 vols. post 8vo.  
**R I V A L R Y**.  
 By HENRY MILTON, Esq.  
 "Two stars keep not their motion in one sphere."  
 John Ollivier, Publisher, 59 Pall Mall.

SECOND SERIES of MR. FABER'S TRACTS.  
 Price 2s. 6d. in boards.  
**TRACTS on the CHURCH and the PRAYER-BOOK**. Second Series.  
 By the Rev. FREDERICK W. FABER, M.A.  
 Fellow of University College, Oxford.  
 The Tracts are sold separately, for distribution, at the following prices:—

1. The Church a Safeguard against Modern Selfishness. 4d.  
 2. Church Doctrine a Witness against Worldly Times. 4d.  
 3. The Unfulfilled Glory of the Church. 4d.  
 4. A Churchman's Politics in Disturbed Times. 6d.  
 5. The Church Calendar, a Help against Time. 3d.  
 6. The Dignity of Little Children. 3d.  
 \* New editions of the Tracts in the First Series are now ready, and the complete Series of Twelve Tracts on the Church and her Offices may be had in 1 vol. price 4s. 6d. in boards.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and Parker, Oxford.

3 vols. 18mo. 5s. half-bound,  
**E A R L Y L E S S O N S**.  
 By MARIA EDGEWORTH.

Also, by the same,  
**Continuation of Early Lessons**. 2 vols. 18mo. 6s. half-bound.

**Rosamond; a Sequel to Rosamond in "Early Lessons"**. 3 vols. 5s. half-bound.

**Frank; a Sequel to Frank in "Early Lessons"**. 3 vols. 5s. half-bound.

**The Parents' Assistant; or, Stories for Children**. A new edition, with elegant Engravings on Steel, from Designs by Harvey. 3 vols. 18mo. 9s. half-bound.  
 London: Baldwin and Co.; Longman and Co.; J. Murray; Hamilton and Co.; Whittaker and Co.; T. Tegg; C. Dalman; Smith, Elder, and Co.; Darton and Harvey; Houlston and Co.; Darton and Clark; L. A. Lewis; Orr and Co.; Hayward and Co.; G. Routledge; and Simpkin, Marshall, and Co.

**JOYCE'S DIALOGUES**, the only complete edition, corrected by Dr. GREGORY. In 1 vol. 18mo. 5s. 6d. cloth.

**Scientific Dialogues; intended for the Instruction and Entertainment of Young People**, in which the First Principles of Natural and Experimental Philosophy are fully explained, by the Rev. J. Joyce. A new edition, with numerous Cuts, and Additions and Improvements, by O. Gregory, LL.D. F.R.S.

London: Baldwin and Co.; Simpkin, Marshall, and Co.; C. Dalman; and L. A. Lewis.

Of whom may be had, price 2s. 6d. half-bound,  
**A Companion to the Scientific Dialogues**, containing a complete Set of Questions, and other Exercises, for the Examination of Pupils.

MR. BENTLEY'S NEW PUBLICATIONS,  
NOW READY.

I.  
NARRATIVE OF  
**A WHALING VOYAGE ROUND THE GLOBE.**

COMPRISING SKETCHES OF

POLYNESIA, CALIFORNIA, the INDIAN ARCHIPELAGO, and the most interesting ISLANDS of the PACIFIC OCEAN; with an Account of the SPERM-WHALE FISHERY, and the NATURAL HISTORY of the WHALE.

By F. DEBELL BENNETT, Esq. F.R.G.S. &c. 2 vols. 8vo. with numerous Illustrations.

II.  
**THE MAID'S HUSBAND; A NOVEL.**

3 vols. post 8vo.

III.  
**ELEVEN YEARS IN CEYLON.**

By MAJOR FORBES, 78th Highlanders. 2 vols. 8vo. with numerous Illustrations.

"Major Forbes is just the writer from whom the British public would most willingly receive an account of Ceylon, which is at this moment a subject of especial interest. He has all the frankness of a soldier, mingled with the taste and judgment of a scholar. Whether he recites the annals of ancient wars, describes the relics of former grandeur, exhibits the proofs of present improvement, or leads us into the forest jungles to enjoy the exciting chase of the wild elephant, we find him equally full of information. This is high praise, but it may easily be justified by reference to the work."—*Athenæum*.

IV.  
**THE COUNTESS.**

By THEODORE S. FAY, Esq. Author of "Norman Leslie," &c. 3 vols.

"We recommend 'The Countess' as one of the best novels we have met with for some time, and we feel sure our opinion will be that of all who read this very amusing and very interesting book."—*Morning Herald*.

V.  
**LYRA URBANICA.**

In 2 vols. post 8vo. with Portrait of Capt. Morris,

**THE SOCIAL EFFUSIONS OF THE CELEBRATED  
CAPT. CHARLES MORRIS,**

Of the late Life Guards, Member of the Beefsteak Club, &c.

VI.  
**MR. COOPER'S PATHFINDER; A ROMANCE.**

3 vols.

NEW WORKS IMMEDIATELY FORTHCOMING:—

I.  
**THREE YEARS' RESIDENCE IN CANADA,**

1837-1839, with Notes of a Winter Voyage to New York, and Journey thence to the British Possessions; to which is added, a Review of the Social, Commercial, and Political Condition of the Canadian People.

By T. R. PRESTON, late of the Government Service at Toronto. 2 vols. post 8vo.

II.  
**THE COUNTESS OF SALISBURY;**

An HISTORICAL ROMANCE. To which is added,

**THE MAID OF CORINTH.** 3 vols. post 8vo.

III.  
**THE STAGE,**

BOTH BEFORE AND BEHIND THE CURTAIN.

By ALFRED BUNN, late Lessee of the Theatres Royal Drury Lane, Covent Garden, English Opera-House, French Plays, &c.

"I am (NOT) forbid  
To tell the secrets of the prison-house."

3 vols. post 8vo. with numerous characteristic Illustrations by Alfred Crowquill.

**RICHARD BENTLEY, NEW BURLINGTON STREET,**

Publisher in Ordinary to Her Majesty.

### REVIEWS OF NEW BOOKS.

*Memoirs of the Life of Sir Samuel Romilly, Written by Himself; with a Selection from his Correspondence.* Edited by his Sons. 3 vols. 8vo. London, 1840. Murray.

We are often, almost always indeed, disappointed in biographies from which we expect much. Either their *matériel*, or the manner in which they are produced,—the exclusiveness of the former limiting the interest to a particular set, to and amongst whom the party has been of importance; or the execution of the latter being ill-judged and imperfect,—are the common causes of failure. In the present instance, we are happy to say our expectations are more than realised; for, distinguished as was the career of Sir Samuel Romilly, we were not prepared for the variety of subject, the panoramic views of society both foreign and domestic, the sketches of literature and literary men, the fund of information on many points of public curiosity, the able opinions and discussions upon topics which, though contemporary, will belong to the history of the age, in all of which this eminent individual took a part, and in some of them such a part that he might well say, *Quorum pars magna fui*.

His own portrait as exhibited in these pages is not the least worthy of careful study. Like that prefixed from the easel of Lawrence and the graver of E. Flinders, it is mild but firm, pleasant, yet tinged with melancholy. Nature seemed to have formed him gentle and plastic, and his manner was ever in accordance with that original stamp. If the education of the lawyer at all narrowed his vision, and taught him to see the black sides of humanity rather than its fairer and brighter colours; or if the bias of the politician distorted some of the objects which engaged his speculation, still it must be admitted that a kind philanthropy overruled the former, and an honesty of purpose controlled the latter. He was throughout his life a prosperous gentleman, his intercourse with the most intellectual and exalted personages of the time was of an intimate description, and the details and anecdotes connected therewith are of a character to render this well and judiciously edited publication most acceptable to every class of intelligent readers.

The work begins with an autobiography from his birth in 1757 to the close of 1789; the first part of which was penned in 1796, two years previous to his marriage, and the last (more loosely) in 1813.

Then follows his correspondence with the Rev. Mr. Roget, his brother-in-law, from 1780 to 1783; and next a selection of papers and letters, &c. to 1806, when he was appointed solicitor-general.

From this date, the commencement of his public and parliamentary course, there is a journal to the close in 1818; but with this for the present we can have nothing to do, as the preceding portions offer more than we can deal with in a single number of our weekly sheet. Reverting to them, therefore, we have to preface our illustrations by quoting the declared purposes of the editors:—

“To record public events did not enter into

the views with which these memoirs were written, neither does it constitute any part of those with which they are published. It should be borne in mind throughout, that to give such a history of Sir Samuel Romilly's life as will illustrate his character, by describing his feelings and opinions as far as the production of original documents will accomplish it, is the exclusive object of this work. The editors have accordingly strictly confined themselves to the task of selection and arrangement. They have sedulously abstained from comment or remark; and, with the exception of the few notes and references, not a word will be found in these volumes which has not been written by their father, or by one of his correspondents. They have, however, availed themselves, although very sparingly, of the power of suppression; but in no case has any passage been omitted which would have given a different colour to the observations in the text.”

To this we add the opinion of Sir Samuel's intimate friend, Mr. Dumont:—

“There is, I think, no other work of this kind which could produce the same moral effects upon a youthful mind. On one side we see great talents, great reputation, and ample fortune; and, on the other, an obscure origin, scarcely any education, years lost—and all these disadvantages overcome by unwearied application, and by efforts constantly directed towards the same end. It is a lesson composed entirely of facts, worth more than volumes of moral sentiments; to which none of those pretences, by which young people commonly reconcile to themselves their own nothingness, can be suggested as an answer. Nor does the example stop here. During twenty years, no one enjoyed happiness surpassing his, and this of a kind to be described by him alone who felt it. Although his natural disposition was not without a tinge of melancholy, this had ceased at the moment of his marriage, and left only that serious turn of mind which gave weight to all his thoughts. I, who knew him from the age of two-and-twenty, could describe how vividly his flexible imagination dwelt on the pleasures derived from the beauties of nature, from literature, from the fine arts, and from the society of his friends; and how he made all these enjoyments keep their proper place in the disposal of his time. But never did I see in him any trace of those habits of despondency which produce discontent with one's self and with the world. A charm, too, is spread over the whole work, and it leaves in the mind a feeling of affection for the author; and this because he displays himself without pretension, and because the picture he draws relates only to those moral feelings, those private virtues, which every one can imitate, and to that domestic life, the happiness of which, as it is derived from the purest and most amiable feelings, creates jealousy in the breast of no one. Mere men of the world will probably disbelieve it: in their eyes it will appear a romance, but one that will not offend them; and, by the middling ranks, the most numerous class of society, these memoirs will be read with the same feeling as that which dictated their composition.”

Of French ancestry, and driven from the south by the persecution of the Protestants, under the religious tyranny of Louis XIV., Sir S. Romilly's father, Peter, became a jeweller in London, and in his boyhood he was an accountant in the shop, occasionally receiving the orders of customers. His leisure was, however, most diligently devoted to the acquisition of knowledge, and Latin, Greek, natural history, poetry, in fine nearly all diversities in the wide circle of intelligence, were in turn earnest pursuits with a mind of uncommon activity and untiring zeal. With all this, however, Chance or Fortune at length directed his lot, and everted him from the counter to the bar, from selling the pearl and diamond to dealing in the trope and argument:—

“A very rich relation (he tells us) of my mother's, a Mr. de la Haize, had died, and had left us very large legacies. To me and to my brother 2000*l.* a-piece, to my sister 3000*l.*, to my father, my mother, and Mrs. Faquier, legacies of about the same amount for their lives, with remainder to my brother, my sister, and myself, and to each of us a share of the residue of his fortune equally with the rest of his legatees. The whole property bequeathed to us amounted together to about 14,000*l.* of 1500*l.*. Blessed be his memory for it! But for this legacy; the portion of my life which is already past must have been spent in a manner the most irksome and painful, and my present condition would probably have been wretched and desperate. I should have engaged in business; I should probably have failed of success in it; and I should at this moment have been without fortune, without credit, and without the means of acquiring either, and, what would have been most painful to me, my nearest relations would have been without resources.”

So true it is

There's a divinity doth shape our ends,  
Rough hew them how we will.”

An opposite chance might have made our great chancery lawyer, though endowed with the same talents and virtues, a bankrupt and a beggar. He was attached to Mr. Lally, one of the six clerks in Chancery, and his picture of this period and its prospects is very natural:—

“In the time of vacation, and in the season of the year for three months together, no attendance was required. The paternal house still continued to be my home, and I still had the means of pursuing, with little intermission, my favourite studies and amusements. I had soon laid out the plan of my future life, which was to follow my profession just as far as was necessary for my subsistence, and to aspire to fame by my literary pursuits. For a few years I still cultivated the talent for poetry which I supposed myself to possess. But insensibly, as my judgment improved, my self-admiration abated; I even grew dissatisfied with what I wrote, and before I had attained my nineteenth year I had the sense, and I may say the good taste, to wean myself entirely from the habit of versifying. I did not, however, relinquish the pleasing hope, for such it was to me, of becoming a very distinguished author. I began,

therefore, to exercise myself in prose compositions; and, judging translations to be the most useful exercise for forming a style, I rendered into English the finest models of writing that the Latin language afforded; almost all the speeches in Livy; very copious extracts from Tacitus; the whole of Sallust; and many of the finest passages in Cicero. With the same view of improving my style, I read and studied the best English writers, Addison, Swift, Bolingbroke, Robertson, and Hume, noting down every peculiar propriety and happiness of expression which I met with, and which I was conscious that I should not have used myself. While I was pursuing these studies with unremitting zeal, I formed an acquaintance which has had great influence on all the subsequent events of my life. It was that of Mr. John Roget, a clergyman and a native of Geneva, who had then lately left that city, and had been elected minister of the French chapel we attended. It was no longer the gloomy building which I have described. Out of the permanent funds of the church a new chapel had been erected upon a different spot; small, indeed, and suited to the congregation, but neat and cheerful. The difference between the old and the new edifice was not greater than between the newly elected preacher and his predecessor. Instead of the stammering monotony, and the learned, but dry and tedious, dissertations of Monsieur Coderc, we heard, from Roget, sermons composed with taste and eloquence, and delivered with great propriety and animation. He was, indeed, possessed of the genuine sources of eloquence; an ardent mind, a rich imagination, and exquisite sensibility. Immediately upon his arrival in England, he became acquainted with our family, and that acquaintance soon grew into very great intimacy with us all. He took pleasure in talking with me about my studies; used to give me great encouragement to persevere in them; and often pronounced of the talents which he supposed me to possess, predictions that have never been fulfilled, but which, as is often the case with prophecies of another kind, had a strong tendency to bring about their own accomplishment. Roget was an admirer of the writings of his countryman Rousseau, and he made me acquainted with them. With what astonishment and delight did I first read them! I seemed transported into a new world. His seducing eloquence so captivated my reason, that I was blind to all his errors. I imbibed all his doctrines, adopted all his opinions, and embraced his system of morality with the fervour of a convert to some new religion. That enthusiasm has long since evaporated; and though I am not even now so cold and insensible as to be able, under any circumstances, to read his writings with an even and languid pulse, and unmoistened eyes, yet I am never tempted to exclaim, *Malo cum Platone errare, quam cum aliis vera sentire*,—a motto which I once seriously inscribed in the first page of 'Emile.' But though the writings of Rousseau contain many errors on the most important subjects, they may yet be read with great advantage. There is, perhaps, no writer so capable of inspiring a young mind with an ardent love of virtue, a fixed hatred of oppression, and a contempt for all false glory, as Rousseau; and I ascribe, in a great degree, to the irrational admiration of him, which I once entertained, those dispositions of mind from which I have derived my greatest happiness throughout life.

Greatly qualified in after years, as applied to his moral perceptions, still his admiration of the

genius of Rousseau continued to be enthusiastic; and his notices of that author and of Mirabeau are among the most striking portions of these volumes, and which were, we think, evidently intended for publication. But before we arrive at these extracts we must take some little bits on our way. *Ex. gr.* (1781-3):—

"There was a young man of my own age, a student and an inhabitant of Gray's Inn, with whom I, about this time, formed a great degree of intimacy. His great talents, and his learning as a classical scholar, as an English antiquary, and as a profound lawyer, must, if he had lived, have raised him to very great eminence in his profession; *though his honest and independent spirit would, probably, to him have barred all access to its highest offices.* This was John Baynes. He was a native of the West Riding of Yorkshire; had received his early education at Richmond in that county; and had afterwards very much distinguished himself both in mathematics, and in the classics, in the University of Cambridge, where he became a fellow of Trinity College. A man more high-spirited, more generous, more humane, more disposed to protect the feeble against the oppression of the powerful and the great, never adorned the annals of England. His premature death, which happened five or six years after the time I am speaking of, I have always considered as a very great public loss."

We have quoted this as a remarkable dictum from a man, himself a distinguished lawyer, who rose to "the highest offices" in the profession; and who yet assures us that they are shut against "honest and independent spirit," against the "generous and humane," notwithstanding profound learning and great attainments. His own life seems to disprove the assertion, but it is a singular one, and perhaps one in which the exceptions only prove the rule. Here is another amusing piece of law, and it relates to his attached servitor:—

"I had (he says), sometimes, employed him to copy papers which I had amused myself with writing upon abuses existing in the administration of justice, and upon the necessity of certain reforms. He had seen with great regret the little progress I had made in my profession, and particularly upon the circuit, and had observed those whom he thought much my inferiors in talents, far before me in business; and putting these matters together in his head, he entertained no doubt that he had, at last, discovered the cause of what had long puzzled him. The business of a barrister depends on the good opinion of attorneys; and attorneys never could think well of any man who was troubling his head about reforming abuses when he ought to be profiting by them. All this he, one day, took the liberty of presenting to me with very great humility. I endeavoured to calm his apprehensions, and told him that what I wrote was seen only by himself and me; but this, no doubt, did not satisfy him."

Our next is an anecdote of a later date, and different kind:—

"I produced a little tract, which I published without my name, as 'Observations on a late Publication, entitled, 'Thoughts on Executive Justice';' and I added to it a letter of Dr. Franklin's to Benjamin Vaughan on the same subject. A few of my friends,—Baynes, Vaughan, Lord Lansdowne, Dr. Jebb, Wilberforce, and Sir Gilbert Elliot, knew that the work was mine, and highly approved it. I never, however, publicly avowed it, nor had I any encouragement to do so; for, though it was much commended in the Reviews, it had

so little success with the public, that not more than a hundred copies of it were sold. I sent a copy to each of the judges; and I had great satisfaction in hearing Mr. Justice Willes, while he was on the circuit, speaking highly in its praise, and wondering who could be the author. To Lord Sydney, who was then Secretary of State for the Home Department, I also sent a copy; but it was not received, his servant having told the person by whom I sent it, that he had his lordship's orders not to receive any letter or parcel without knowing whom it came from; a curious precaution to be used by a minister who is at the head of the police."

[To be continued.]

*Narrative of a Whaling Voyage Round the Globe, from the year 1833 to 1836, comprising Sketches of Polynesia, California, the Indian Archipelago, &c. With an Account of Southern Whales, the Sperm Whale-Fishery, and the Natural History of the Climates Visited.* By F. D. Bennett, Esq. F.R.G.S. Fellow of the Royal College of Surgeons. 2 vols. 8vo. London, 1840. Bentley.

MR. BENNETT'S first chapter impressed us with a very favourable opinion of his work, and a profound respect for himself. Within twenty-five pages we were sailed from London, and landed in Pitcairn Island; and for an author who would not drag us over at least a hundred pages, if not half a volume, in describing such a tract, touching at Madeira, crossing the line, doubling Cape Horn, and looking in at Goat Island and Juan Fernandez, we again acknowledge that we entertain a very profound respect. Even were he guilty of bestowing his tediousness upon us in later parts of his voyage, we would forgive him, and set him up as a bright pattern to such travellers as find enough of matter in a trip from Ramsgate to Boulogne to indite a book full of nothing, and wonderfully inane and tiresome.

His title-page is also worthy of our praise, for it saves us the trouble of *synopsis*, which is occasionally rather laborious when we have very desultory and discursive writers to deal with.

We do not know that we should not add a confession of our admiration of Mr. Bennett for his love of whales. It seems to us, who are content with an affection for whitebait,\* to be a grand passion, and we cannot but honour the man who entertains it, and whose affairs with Cachalots are so full of desperate plunges and adventure—harpoons instead of Cupid's darts, and lances for his arrows—habbering for tears, spouting, junk-eting, and fastening "life lines" to the dear object whose possession is so ardently desired, and never finching till after being tied for better for worse.

But we must leave off our plaudits and listen to the author, whose success in matters of scientific interest may be appreciated when we copy his following statement:—

"The collection of objects in natural history, brought to this country by the Tuscan, consisted of 743 dried specimens of plants, illustrating the vegetation of the lands visited, and 233 preparations of animals, most of which are rare, and many of them unique. The principal part of the botanical collection is now in the possession of A. B. Lambert, Esq. and Professor Don. The zoological I have deposited in the Hunterian Museum of the Royal College of Surgeons in London."

Indeed, we find Mr. Bennett throughout to

\* Vide Greenwich et Blackwall passim: ubi nunc delectissimum est. Tres nostro teste.—*Latium Cunctis.*

be a person well grounded in useful knowledge; and if he be a little enthusiastic on the subject of sperm whales, in all else he is a matter of fact and diligent inquirer, directing his attention to the acquisition of that further information which such a voyage must offer to the observant mind. As a proof of his utilitarianism being superior to his poetic propensities, we may observe that he will not let us even enjoy the classic and romantic histories of the dying dolphin. For he tells us:—

"The changes of hue displayed by the dying 'dolphin' are peculiar; but have been much exaggerated by the poetical descriptions of travellers. Soon after the fish has been removed from the water, the bright yellow with rich blue spots, which constitutes the normal colour of the animal, is exchanged for a brilliant silver, which, a short time after death, passes into a dull-grey, or lead-colour. The original golden hue occasionally revives in a partial manner, and appears above the silver field, producing a very interesting play of colours; but the diversity of tints is not greater than I have described."

Such an author would not suffer us to believe that swans sing their own funeral anthems, dirges, or requiems, though the fact is so well attested by many writers (to the signet); nor that mermaids have tortoise-shell combs and looking-glasses, though every body has heard of the vocal shell in the ocean caves, and that the sea itself looked like glass.

The account of the Pitcairn islanders is still interesting, though we have had the subject handled by other authors, and the following is the only passage we need select concerning them:—

"There is every reason to believe that Pitcairn Island has had inhabitants previous to its occupation by the crew of the *Bounty*; since, in addition to the ruins of morais, images, &c. found on its soil, the islanders informed me that they had recently discovered two human skeletons, lying in the earth side by side, and the head of each resting on a pearl-shell. This last circumstance involves the history of the aborigines in yet greater obscurity; as the pearl-shell, although found in the adjacent islands, has never been seen in the waters around Pitcairn Island. Stone adzes, supposed to have belonged to this ancient race, are not unfrequently found by the present inhabitants, whilst cultivating the ground. Two of these were given to me by Hannah Young, the third daughter of John Adams. They are rudely fashioned, in the ordinary Polynesian form of such instruments; are composed of a black basalt, highly polished; and bear an appearance of great antiquity. It is certainly difficult to account for the extinction of an original race upon a spot so replete with every essential for the support of human existence; and we are led to the hypothesis, that either one of the epidemic diseases, which occasionally scourge the islands of the Pacific, had destroyed the primitive inhabitants to the 'last man'; or that the island was but occasionally frequented for religious or other purposes, by the people of some distant shore, who subsequently discontinued the custom."

We now proceed to Tahiti, respecting which a few particulars may be gleaned:—

"There (the native) language has no word beyond *maitai*, good, to acknowledge the receipt of a kindness; nor has it any equivalent to 'gratitude'; and there is reason to believe that the feeling itself is rather more deficient in these people than in Europeans. Neither

sex is at all social in domestic life. The treatment of the women is now in no way objectionable: the wife shares with the husband the duties of their station, the more laborious being assigned to the man. The majority of the married women have a potential voice in domestic arrangements, and in traffic it is often difficult to get a man to conclude a bargain until his wife has been consulted. The removal of some ancient prejudices has raised the native woman to her proper grade in society; but, while her physical condition is thus improved, the same advance is not perceptible in her moral character. Chastity is not esteemed a virtue either in the single or married state; on the contrary, licentiousness is so interwoven with the national habits that a virtuous female is here a rare exception to her sex, is held in no esteem, and is seldom to be met with even in name—a remark which does not except the blood royal, nor even the most devout members of the church. The missionaries have been naturally anxious to suppress so prominent a vice; but in no part of their task have they been less successful. The strict laws enacted on this subject have tended but to restrain the more open profligacy; and, unless delinquents can be made liable to the same moral punishments as in well-ordered nations, no radical amendment can be expected. These people found their ideas of great men upon the most literal basis: they invariably associate a lofty mind with a corresponding altitude of person; and entertain but little respect for short men, or, as they are apt to term them, boys. A missionary, sent among them some years ago, occasioned much disappointment by the lowliness of his stature, and many impatient inquiries, of slighted consequence, 'if there were no taller men in Beritani, that a teacher so small as this should be allotted them?' A somewhat paradoxical taste is also evinced for a fair complexion, or the nearest approach to one; *taata ere ere*, or blackman, they regard as a term of reproach; each, probably, thinking himself less dark than his neighbour.

The pure element from the mountain stream, or the fluid contained in the young cocoa-nut, is the more usual beverage of these islanders; though many of them will indulge to excess in the ardent spirits which they obtain by barter from foreign vessels—a traffic much to be deprecated, and one in which it is to be hoped no master of a ship would engage, unless compelled by the sternest necessity. They procure, also, from the neighbouring island of Borabora a large quantity of a colourless liquor distilled from the bread-fruit. This spirit is sufficiently strong, and bears some resemblance to whisky. The natives name it *ava*,† after the intoxicating drink they formerly prepared from the roots of the *Piper methisticum*, the use of which is now obsolete, and the plant itself almost extinct on these islands. The systematic manner in which the natives intoxicate themselves is not the least curious feature in their character. They will refrain long

\* "I feel reluctant to attach blame to the shipping of the United States of America, lest it should be construed into the pettiness of national prejudice; but it would, on the other hand, be unjust to conceal the fact, that the 'temperate ships,' so numerously sent forth from American ports, are actually the principal purveyors of ardent spirits to the natives of these islands. Their crews (themselves conscientiously abstaining from spirits) are usually provided with a large quantity of rum, for the sole purpose of conducting a lucrative traffic with the Polynesians; while the latter are but too eager to make sacrifices to obtain this inviting but pernicious luxury."

† "A second, and more figurative name, occasionally applied to this liquor, is *pape pepe*, or the water that flows."

from spirits, or very abruptly relinquish their use, but when inclined to indulge, nothing short of the most complete inebriety will satisfy them. Many amongst them consider that a moderate use of ardent spirits is tantalising and disagreeable, and will often refuse to partake of any, unless they can obtain enough to produce the 'happiest' effects. During our present visit to Raiatea the vice of intoxication was not so prevalent as we found it at a subsequent period; yet, on every fresh importation of liquor from Borabora, it was common to see the more debauched islanders parading the settlement in a state of riotous intoxication, linked arm-in-arm for mutual support, and with bottles of spirits slung round their bodies, and cocoa-nut-shells in their hands, occasionally pausing to drink, then renewing their route, yelling like demons, until, incapable of further advance, they expended their last gleam of reason in seeking the nearest shed for a swinish repose. The labours of the missionaries are in no way rendered so nugatory as by the abuse of spirits amongst the natives; while it is equally evident, that unless effective, and, above all, permanent measures are adopted to check this increasing evil, the extermination of the aboriginal tribes will be as rapid as inevitable."

Mr. Bennett, however, in a graver essay upon the effects of missionary labours, holds that they have been and must be productive of great good among the population of these Polynesian Islands. Those of "The Society," and "The Sandwich" were next visited; and we copy the annexed notices respecting the latter:—

"A remarkable method of staining the skin is adopted by both sexes, and appears to be peculiar to this people. It consists in applying to the surface of the body the recent root of the plant *idiee* (*Plumbago Zeylanica*), when a temporary irritation is produced on the skin, and the latter becomes stained of a dark hue, similar to that produced by lunar caustic, and equally permanent. The taste of the native is chiefly shewn in arranging on his skin portions of this root in the form of stars, crosses, circles, or other devices, which subsequently remain conspicuous for their blackness above the natural hue of the native complexion. A practice also obtains with the females of staining their cheeks and hands with the red juice from the berries of the herb *Phytolacca dodecandria*; or as a substitute for this vegetable dye, which is rather difficult to obtain, they will now sometimes employ the pink fluid contained in the flowers of the exotic Marvel of Peru (*Mirabilis Jalapa*). When thus rouged, they appear to possess florid complexions, struggling through the natural bronze of the skin, and in a female with good features the effect is pleasing, not to say imposing. These islanders subsist almost entirely upon taro roots, sweet potatoes, and fish. Taro is their chief dependence—it is to them as the bread-fruit to the Tahitians, and its cultivation is their most important agricultural employment. They eat it in the form of a paste, or poi, which they prefer when it is in a fermented and acid state. The vast quantity of this food which an ordinary native, but more especially a chief, will devour at one meal is a subject of perfect astonishment to the European. When intended to be kept for some length of time, the baked taro-roots are pounded into a dry and compact mass, which is enveloped in leaves, and named by the natives *ai paa*, or hard food. Yams, bananas, and bread-fruit, are very rarely consumed by the generality of natives. The first-named

vegetable is chiefly grown for the supply of shipping, and the two last are far from being abundant. Swine and fowls are also much less numerous here than at the Society Islands, and are mostly reared for traffic with foreign vessels. As adjuncts to their vegetable food, the poorer natives collect wild herbs from the pasture-lands, chiefly a kind of wood-sorrel, or a species of Euphorbia, and even an *ufua* which forms 'the green mantle of the standing pool'; while crowds of the same people may be seen swimming and diving outside the great reef at Honoruru, to obtain shell-fish, crabs, sea-weed, and other marine esculents, which they deposit in floating calabashes, and convey to the shore for their day's meals. There is no animal food which a Sandwich islander esteems so much as fish: whether recent, salted, or even in a state of putrefaction, it always proves acceptable to some class of the population. Many canoes are employed day and night in fishing off the shores of Oahu, yet the supply of fish is not equal to the demand, and large quantities (often including sharks and other coarse kinds), dried or salted, are imported into Honoruru from the neighbouring islands. The chiefs, whose diet is less restricted, keep live fish in tanks, or reservoirs of sea-water dug in the vicinity of the coast, and have some of the smaller kinds, taken in the bays, conveyed alive to the interior of the island in calabashes of sea-water. The *fe*, or cuttle-fish, is considered a luxury by all classes: when fresh and well cooked it is certainly an excellent food, and in consistence and flavour is not unlike the flesh of a lobster's claw. A palatable native dish is prepared, by stewing in an oven an assemblage of fowls and other meat, young taro-leaves, and sweet potatoes, the whole contained in a calabash. Thus cooked, the taro-leaves afford a wholesome and agreeable food. The entire dish is called *luau*, a name which is also applied by the foreign residents to any public or jovial feast. Since the preparation of taro poi is a tedious task, and many of the natives in Honoruru are transient visitors, or actively occupied as servants to foreigners, a market is established in the town, where that popular food can be purchased in a state fit for immediate consumption. A hut, called by foreigners the 'native hotel,' has also been opened as an eating-house for the same class of people; and here, it is not uncommon to see a skinned dog suspended invitingly at the door, to denote what dainties may be had within, in the same manner as a turtle or a haunch of venison is occasionally exhibited at *restaurant* establishments in London. From the roasted and saccharine root of the *ti* shrub the islanders distil a spirituous liquor called *kava*, and which is similar to the *ava* prepared from the bread-fruit at the Society Islands. Though no restriction is placed upon its preparation or use, and some of the natives will indulge immoderately in this, as well as in foreign spirits, drunkenness is not a popular vice. The people have been deprived of their ancient dances through the influence of the missionaries, and their taste and appliances for music are not of a superior order. Their idea of song is beyond every thing extraordinary. It was long before I could rightly comprehend that the droll concatenation of sounds proceeding from a cheerful native were intended for vocal harmony, the loud, whining, and monotonous tone of a school-boy spelling a long word, affords the best comparison for their very peculiar mode of singing. In musical talent they are decidedly inferior to the Society islanders; some

young females, trained by the missionaries to sing at the church of Honoruru, though they have powerful and good voices, are constantly getting astray in time and tune. The primitive musical instruments, yet in use, are drums, made from a calabash, and covered with shark's skin; flutes; large and empty calabashes, beaten upon with the hands and allowed to fall on bales of cloth with a dull booming sound, which is accompanied by a wild chant from the performer; and two sticks, beaten together as an accompaniment to a song called *hura ke raau*. The only aboriginal games we notice among them was one resembling quoits; a second, played with black and white stones on a chequer-board, in a manner approaching to chess or draughts; and the *pahu*, or darting rods along the smooth ground to or beyond a determined mark. Horsemanship is now a favourite exercise with both sexes—the females riding *à la fourchette*. They invariably ride at full gallop; and a native peasant, attired in primitive costume, and mounted on the bare back of a steed, bears in his attitude, his naked and well-proportioned limbs, and his cloth flowing wildly about him, no slight resemblance to an equestrian figure from the antique, executed in bronze.

Infanticide is common and fashionable, and the lamentable decrease in the population is also accelerated, at least in Oahu, where there "is a novel and anomalous epidemic disease, of a very fatal character, that attacks breeding women, both native and half-caste, and strikes at the root of population by destroying both parent and offspring."

A pretty mode of catching butterflies

(I'd be a butterfly, born in a bower!)

is mentioned here, though employed against a moth (the *sphinx pungens*):—

"It flies by day, and appears to seek the warmth and brightness of the noontide sun; and flitting from flower to flower, on which it seldom alights, it drains the nectar from the blossoms with its proboscis as it floats in the air with a rapid, vibratory motion of the wings. On one occasion, when I was endeavouring to capture this coquetting insect, a native came to my assistance, and undertook the task in his own way: gathering two of the elegant blue convolvulus flowers around which the moth had been fluttering, and holding one in each hand in an inviting position, he cautiously approached or followed the insect to tempt it within his reach. The active but stealthy movements of the young and scantily clad islander, as he pursued his shy game over the plains; the seducing attitudes he assumed, and the insinuating manner in which he presented the flowers to the moth when opportunities offered, afforded a very ludicrous scene. Although the exertions of my entomological friend were at this time fruitless, I have often seen the plan he adopted successfully employed by other natives; the hawk-moth, approaching the proffered blossoms, protrudes its long proboscis, which is seized with the fingers, and the creature secured."

And having accomplished this flowery feat, we must wait for another flight of *Gazettes* to afford a second notice to Mr. Bennett, and his whales.

*Miss Aylmer; or, the Maid's Husband.* 3 vols. 12mo. London, 1840. Bentley.

WE have been amused with the volumes before us—not in the way of praise do we say so—for we were simply amused by the utter absurdity

of the aim, and the extreme weakness of the arguments; at the same time a feeling of regret at—to say the least—a mistaken effort in the writer to prevent others of her sex from trying in the lottery of matrimony, from which she evidently has not drawn a prize, although she asserts the contrary. The whole work is redolent of querulous discontent; and, whether speaking in the first person, or by the mouths of the female *dramatis personæ*, the eyes are clearly on the anti-matrimonial side. Fair maids—ay, and dark ones, too—are cautioned and warned to choose wisely, if at all—though how to do so is not very plainly shewn. Young, rich, and fair, is the heroine of these pages; seeking perfection in the husband line and finding it not, poor thing! until her imagination helps her, and she sets her heart upon a kind of juvenile Dominie Sampson, to whom she has scarcely spoken. Then comes a scene which we quote; first observing, that no love has previously been shewn on either side, until, in giving a child a lesson, the Dominie says—

"*Ego amo—I love.*" She started; he had said it in his own sweet tone! '*Amas tu—Dost thou love?*' Good God! what was to become of her? *what could she do?* It was an answer wrenched from her as it were by the roots. She did not expect it. There was no display of supernumerary and sprouting branches; a thousand sentiments, instead of being scattered up and down at distant intervals, and therefore unnoticed for their richness and variousness, condensed into one deep sentence! The story of a life, developed in a word. So simple, so artless! Where were now the feelings of the ambitious girl, who had brought herself to expect so much in the man of her choosing? She had chosen—and what? A man who could scarcely call his name, ugly as it was, his own! [It is Bracken.] Inexperienced and guileless he sat, reaping the rich harvest of her love. She had crossed the room, and had glided into the chair beside him—the peerless creature of his secret devotion! Her cheeks burned with a brighter blush, the warm pressure of her hand was on his, and she started, and then fondled it, for his was cold as marble. Oh, how she stooped, how she demeaned herself, to put him on a par with her warm, her ardent fondness! It was Venus in tears, enrapturing Jupiter! [Oh Dominie, dirige?] But, alas! Rosalind was the Jupiter. The novelty of her position delighted her. It was meritorious to tell him the depth of her devotion. His temporal prospects should be hers! his name even. Bound by no other force of affection, cemented by no other link, all she possessed should be his! And she looked up to his face to receive a corresponding assurance from the sunshine of his eyes of the feasibility of her professions. But all her heightened fascinations, her tender developings, her lovingness, her trustful sincerity, sank there, as in a cold damp grave. He had clasped her hand in his, it was true, but it was the clasp of death! And it were better that he were dead—that they were both dead, than to mock her in the manner which he had done. Better be altogether cold, than this short-lived proffer of affection! But there were various gleams of light, albeit such dubious, unearthly devotion! Once, and once only, his lips met hers. '*Rosalind,*' he said, as one after another he kissed her pearly teeth, [quere, including the wisdom and eye-teeth?], 'be this moment good or bad, subservient to your own warm fancies, or seeking only to betray, remember, I die content! A solitary, a sad unsocial life is all repaid;—pining to be loved, I am loved. O gracious powers! the sun came down to woo the cold, cold

moon! Proudly accomplish your purpose, mark the tame creature you proclaim your own! Look at his wasting limbs, his hollow cheeks!—a little while, and no one will believe that he has been. And yet he dies proudly eminent, all ambition gratified, contending wants fulfilled. Such has his merit been, that she, who could move the world to follow, lies in his arms, a simple, fondly loving girl.—*the crumpled rosebud all his own.* And with a delicious indistinctness, he talked and kissed, till a faint colour spread on his before pale cheeks, and the death chill on his hands was subsiding. Oh, how she whispered in his ear her fond, fond vows of love! Oh, happiness too sweet to last!"

Nothing can soften the fact; the lady thus pops the question—the gentleman does not seem to avail himself of the proffered honour, and the lady consoles herself with a silent, queerish, old guardian. And here, again, we have a scene worthy of this unequalled pen:—

"Rosalind had left her chair, and was leaning over the back of his, as he sat. She had felt it convenient to conceal her countenance; but there was, as he said, a fondness in the manner in which she had taken her position, that in no way repressed him. And he kept down his breath, and listened calmly, as she said, 'You may believe, Mr. Waldegrave, my heart is made for love; and I have loved—in secret loved! and do not let me lose all claim to your good opinion in confessing, that perhaps it was 'unwisely, but too well!' Originality has always charmed me; and fancy is sometimes very foolish; then, after a pause, she said—a slight pause—'I believe it was the shadow I loved—of what was to follow. It is strange,' and she stopped between each word; and there was a trepidation in her voice, covered by a slight laugh, as she continued, 'but one object only seems to have possessed me: enigmatical, it is true, taken either way—backwards or forwards—it is still an affection that has possessed me. I confess it may seem inconsistent—but not inconsistent to you.' And the you felt the pressure of her soft hands: and her breath passed so near his cheek, flushed into 'a snatch of youth,' by the ardour of his feelings, that, though she had much more to say, he turned, and caught her to his heart, in a long and fervent pressure. 'Whom is it you love, my own sweet Rosalind?' he said, as he imprinted on her open lips his first warm kiss of affection. She felt fluttered and confused. It was a dream redreamt. She again saw the dark full eye gazing fondly on her; the blushes were again upon her cheeks—cooled, perhaps, by the few months that had since then!—when?—passed over her. But yet she loved—deeply, and devotedly. 'I do love,' she said, with that deep energy, so becoming, and so natural to her. And before they parted, she had confessed that it was her own sweet guardian. There is a delight in the calm that succeeds a confession of love. We feel like passengers who have taken their place for a long journey; and who, after much sorting, packing, and arranging, have fitted themselves in for the first stage."

Delicious! We will not meddle with the other personages who figure in these pages, for the foregoing is enough to shew their peerless excellence in character, action, and dialogue.

But we must copy a specimen or two of the style, which certainly cannot be called polished. For instance:—

"Absences are unavoidable events, that must come, and the return brings a *flare-up* of passion." "You mean to say, if I was rolled in a gutter I should not be disagreeable." "The careless indifference he cuddled himself into."

*Description of a Lover.*—"It was distressing to watch him after it was known that Miss Aylmer was really gone. Some days he was all bristles like a hedge-hog, then like a pining child—silence and sorrow overwhelming him."

Here we conclude; only adding, Heaven forbid a single proselyte should be made by these pages; or, if there be, Heaven forbid that we should meet her: she would be like the Miss Aylmer of the book—a selfish and mistrustful woman.

*Colburn's Calendar of Amusements in Town and Country for 1840: comprising London Seasons and Sights; Balls, Races, Fairs, &c. &c. &c. With Twelve Illustrations by R. Cruikshank. Edited by Boleyn Reeves, Esq. 12mo. pp. 356. London, 1840. Colburn.*

This volume, with a good deal of originality, bears a resemblance to Hone's "Every-Day Book;" and, like that publication, is calculated to be generally popular. Its loss of two or three months of the year before it issued from the press is to be regretted; and we are afraid, as far as we are concerned, that we have negligently added two or three weeks to the score. We cannot much commend the style of embellishment, paper, or what is called "getting up;" for our day, and the publisher's acknowledged taste, they are extraordinarily ordinary. But the subject-matter displays very considerable talent, and Mr. Reeves well deserves to be welcomed among the most agreeable caterers for the public edification and amusement, on all the variety of matters which his pages embrace.

Every month is introduced and closed by a brief essay, or observations applicable to the occasion. Thus our present month of April:—

"This month, April, is one of the merriest in the dozen! Hearths are crowded by the young fellows who shall supply our places, and the young lasses who will make grandfathers of us; and many a pleasant story is told, while many a hearty laugh bears witness that it is told well: a general diffusion of joy takes place, and they that dwell in a castle are never a whit happier than those who have only a cot above their heads. A happy hearth is one of the most delightful objects in life, and it is only your thorough poet that may attempt to describe it: he who like Burns or Goldsmith has helped to create the joy and becomes a contented sharer in it. Every domestic picture touched by their hands is universally known and appreciated; for who would affect ignorance of the cotter's 'expectant wee things?' or the harmless people at the vicar's fireside, who had several ways of being good company? Seed has beautifully said, that 'we are affected with delightful sensations when we see the inanimate parts of the creation, the meadows, flowers, and trees, in a flourishing state. There must be some rooted melancholy at the heart, when all Nature appears smiling about us, to hinder us from corresponding with the rest of the creation, and joining in the universal chorus of joy. But if meadows and trees in their cheerful verdure, if flowers in their bloom, and all the vegetable parts of the creation in their most advantageous dress, can inspire gladness into the heart, and drive away all sadness but despair; to see the rational creation happy and flourishing ought to give us a pleasure as much superior, as the latter is to the former in the scale of beings. But the pleasure is still heightened, if we ourselves have been instrumental in contributing to the happiness of our fellow-creatures, if we have helped to raise a heart

drooping beneath the weight of grief, and revived that barren and dry laud, where no water was, with refreshing showers of love and kindness.' Yet the pleasure of the season is not confined to our social hearths, but divided between them and the grassy fields: a mild and balmy influence is felt in the air, which tempts even the invalid to venture into it; and, of a truth, every healthy biped that now neglects to exercise his locomotive system deserves to incur all the debility his indolence will insure to him. In this glorious health-giving time, 'twere next to profanity to avoid the blessings which may be so cheaply secured. A brisk walk in the eye of the wind, with a mind in tune with nature, and willing to extend its virtues to all around, and a heart alive to gratitude and not dead to benevolence, is sure to afford a fine stock of mental and corporeal vigour, and to nerve the spirit against the hour of trial which requires the exertion of all the little strength we are masters of. The earth herself laughs with her laughing creatures; and, in the whiles of her mirth, a thousand timid plants make themselves visible: and up comes the green grass to glad our eyes, and to mantle the bare fields, where every creature, most serviceable to man, doth most desire to be; and where man himself should more frequently be, and it would infinitely serve him. For there we can acquaint ourselves with the bounties of our generous Creator, and though the words of the sin-enslaved sceptic, like echoes from a pestilent cavern, may obtrude, the eye can convince us by one broad view of the uncircumscribed firmament, or an observant glance at the mysterious operations of the fruitful earth, that there is a power which is not the less evident because it does not mock its divinity by appearing in a palpable image to every doubting idiot. And there, as we sometimes note the hand on the dial, and fancy that we detect its little step, our eyes may watch the silent efforts of each tiny plant; while the clear hearty pipes of the young birds—musicians of sweet promise—shake the dull sleep out of the infant leaves, and drown the voice of a determined rivulet, which bursts through the mountain moss to catch the gleam of early day, and to see and be seen; with the wind spreading about us like the breath of the guardian angels, who sing of God's goodness to the world which they protect; and a hundred things besides, all known to the hardy herdsmen, and to the world-neglected poet, who transfers the glory of Nature to his pages, and perishes at the threshold of his immortality. And from thence, with a fluttering rapture in our hearts, and something like a tear in our eyes, we return to our home—perhaps to a kind companion and prattling young things; at the first glance all is drowned in a gush of gratitude; we press that kind companion to our breast, we group our children within our arm, 'the April's in our eyes, it is love's spring,' the started tears take their own course; a noble and manly emotion works within us, and we lift up our spirits and acknowledge that God is good!

Sports with the gun are over, but the races begin to afford much interest to all who relish good game; and there is no scarcity of employment for the angler. The rivers, swelled by the winter rains and ruffled by the sportive breeze, rush on in the joy of a second youth: the trees, by some mysterious sympathy, are bent over them, and the lightly-jumping glowworms trounce darts from the shadow of a rustling twig as from the presence of the destroyer. It is, however, at these times we feel most shaken in our

fealty to honest Isaac, and the *frères* of the craft; a repugnance to strike out the life of a quick creature takes possession of us, and we benevolently join the poet, and exclaim, 'Oh, that man were as careful of his own happiness, as he is industrious to destroy that of others!' The occupation of the angler affords him fine room for reflection, and indeed persons well affected to the sport are usually of a reflective caste, the more solid endowments of philosophic inquiry and sound judgment forming a prominent portion of the character of an angler. A sincere love and veneration for antiquity, respect for the rural institutions of our forefathers, a desire to see peace, order, and concord in the realm, an enthusiastic admiration of the poets, and a very evident inclination to be themselves quiet and to leave others so; these are requisites in the composition of anglers which we wish sincerely were more liberally diffused. \* \* \* And now, farewell April, peace be with thee for a mild and merry month! And, were it not that a milder and merrier, and one that wept less, were at the threshold, we should not have a smiling face to welcome it in; but, when May—

With her sunny curls  
Beckons us at the gate,  
We were but unmannered churls  
To weep and let her wait."

A portion of the Kalendar for the week, viz. Monday and Tuesday, just past, may be cited as a sample of the author's general design:—

"Monday, April 20th.—Newmarket Craven Meeting (first day).—The Craven stakes of 10 sovs. each, A.F. Handicap sweepstakes of 10 sovs. each, Ab.M. Twenty-six Riddlesworth stakes of 200 sovs. each: hf.-ft. Ab.M. Sweepstakes of 150 sovs. each, A.F. The Produce stakes of 100 sovs. each, hf.-ft. A.F.

"East Sussex Races.—The farmer's stakes; silver bowl and specie: heats, the new course. The East Sussex hunters' stakes of five sovs. each, with twenty-five added by the town; heats, the new course, with two leaps over hurdles each in going out.

"Driffeld's Anglers' Club.—The season for angling in the far-famed streams preserved by this club commences with the present day.

"Greenwich Fair.—This great national event, which neither desires nor deserves any colouring at our hands, is one of those gaudy and glittering occasions which, like powerful magnets, attract all the base ore of the metropolis. The objects of commiseration, who have groaned through a long winter with afflictions (stated in coloured chalks on the portion of pavement they diurnally occupy), who, in the Van Amburgh spirit, have taught a little dog to implore and to accept contributions for them,—the absence of arms, tongues, eyes, legs, &c. in a great measure preventing them officiating personally,—now, vigorous and volatile, spring nimbly on the apex of the metropolitan mail, articulating 'Greenwich, ho!' Now, the fervid children of Erin, with a 'Horroo! Faugh a ballagh!' \* enlarge themselves from the liberties of little Hibernia, and turn their frontispieces towards Greenwich. (Their less energetic brethren have preceded them a week, that being about the time they annually consume in drinking their way down.) Now, from the cigar-divans in the Strand and the Quadrant, fair count(ess)es may be observed stepping into private carriages driven by private gentlemen, who, dispensing with their slaves in livery, and hoping the populace will mistake them for 'those blackguard lords,'—whirl through the streets, as a Bristol-Byron says,

\* "Clear the road."

'in all the majesty of mud.' Now upon the road may be seen stages-and-four, coaches-and-two, and cabs-and-one, with *cram* licences—a term well known to the *whippers*, who upon this day, by superhuman exertions, prove their right to the title. Here, like Atlas struggling under a giddy world, a wretched donkey wags (we use the next word advisedly) under a wagon, which must have been erected to mock the efforts of a troop of horse. Countless hands, armed with countless missiles, stimulate the martyr in the rear, whilst a child precedes him holding a wisp of hay to his mouth. The bait has its effect: of the posterior applications he appears happily unconscious. But who and what are they that occupy that vehicle?—Alas! none but themselves know who they are, or what they would be. The police reports, it is true, afford some information, and that of a nature perhaps to satisfy a moral curiosity. How shall we describe Greenwich?—Confusion and consternation! hilarity and horror! Children not visible; pocket-handkerchiefs not forthcoming (distress for each equally evident). People here, full of frenzy, exclaiming, 'What imposition!' Others there, full of frolic, lisping out 'What fun!' Syrens insinuating, 'Tea and coffee! tea and coffee!' and slaughterers shouting, 'One shilling a-head, sumptuous dinners!' At night, the 'fair and free' assemble in the 'Crown and Anchor,' 'The Palladium of British Freedom,' 'The Thunder-box,' and 'The Roaring-Rattling-Rioters,' booths, where the waltz is done strict justice to, and the orchestra, assisted by the united exertions of all present, absolutely intoxicates the ear. Outside, they revel also; the 'shilling considerers,' preferring a penny privilege, are swung up into the face of heaven, and *vice versa*, in a machine very like a gallows, which is put in motion by a fellow very like an executioner. Others speculate in porter and pudding, and laugh at the vanity of human nature. Some, what removed from these, but judiciously posted on a gin-cask, like the first advertisement of 'The National-pure-spirit-circulating Society,' one of those Emerald children, previously adverted to, declares, in thoughts that breathe and words that burn, that potheen is, beyond all compare, the first liquid in existence; and favours his audience with a new and true reading of that passage in history relating to the fusion of pearls in a goblet. This he denominates *bolther*! and proceeds to shew that the draught in question was nothing *less* (how could it be *more*?) than potheen—imported Irish potheen—which the people beyond seas thinking a *jewel* of a drink, gave rise to the 'inadvertancy.' With the following eulogy of his subject, he concludes a chant of almost numberless numbers:—

Sweet potheen! when all things are fading away,  
And the last mortal man on his death-bed is lying;  
If I be that man, when I'm changing my clay,  
I'll just moisten the same to prepare it for dying.  
And all the consarn I'll then entertain,  
In taking my last *doch a dorris*,\* is this—  
That I'll never more taste thee, my darling, again,  
Unless you get licensed in regions o' bliss.  
What an out-and-out elegant paradise that,  
Where all that are lovely and social unite;  
Where the day never ends, and angelical Pat  
Takes drink and diversion from morning till night.  
Ah! come when it will, I'm impatient to go,  
The minute the notice to quit will be given;  
For with potheen, as good as I've tasted below,  
I'll make myself satisfied—even in Heaven.

"In one very secluded corner, a young gentleman, whose pockets teem with the misguided bounty of his indulgent friends, seems steadily determined to have his 'whistle'; and stands a very probable chance of getting it slit across by

\* "Parting cup."

a slumbering sailor, at whose nose he is about to ignite a sky-rocket. According to the axiom of the Greek orator, Greenwich Fair ought to be the finest school of eloquence in England; for, with one exception—that of the above-mentioned sleeping sailor—all is 'action—action—action!' Pity that so much of it should be actionable!

"The Spital Sermon.—The boys of Christ's Hospital walk in procession, accompanied by the masters and steward, to the Royal Exchange, from whence they proceed to the Mansion House, where they are joined by the lord mayor, the lady mayoress, the sheriffs, aldermen, recorder, chamberlain, town-clerk, and other city officers, with their ladies. From thence the cavalcade proceed to Christ Church, where the Spital sermon is preached by one of the bishops, and an anthem is sung by the children.

"Grand Civic Feast and Ball at the Mansion House.

"Wrestling.—Devon and Cornwall wrestling at the Royal Standard, City-road.

"Epping Hunt.—This Cockney sport is almost extinct. It has been for some years gradually declining; and, from the appearance of the hunt of 1839, we should scarcely expect to hear of another.

"Tuesday, April 21st. Newmarket Craven Meeting (second day).—The Oatlands stakes of 50 sovs. each, hf.-ft., and only 10 if declared, &c.; the forfeits to go to the second horse. D. T. The seventh Tuesday's Riddlesworth stakes of 200 sovs. each, hf.-ft. Match.—Mr. Greville's Proteus against Lord Exeter's colt Stamboul, by Reveller, out of Galatea; 8 st. 5 lb. each. D. M. Sweepstakes of 100 sovs. each, hf.-ft. D. M.

"Royal Western Yacht Club.—Patroness, Her Majesty; Commodore, Sir Thomas Dyke Acland, Bart., M.P.; Vice-Commodore, Rear-Admiral Warren; Rear-Commodore, Captain Charles Bulkeley. This distinguished club annually increases in interest and national importance. Among the names included in the list of presidents are those of the Earl of St. Germans, the Earl of Morley, Lords Lisle, Elliot, M.P.; Sir Ralph Lopez, Bart.; Rear-Admiral Ross, C.B.; Sir L. V. Palk, Bart.; Rear-Admiral Sir E. D. King, K.C.H.; and Sir George Magrath, Kt. M.D. Among the vice-presidents are the names of some of the most distinguished noblemen and gentlemen in the kingdom. The number of members on the list amounts to 200. The Club-house, Mill Bay, Plymouth, is most conveniently situated, and well fitted up with reading, billiard, and card rooms, in addition to which it has been deemed necessary to build a new dining-room and a second billiard-room. It overlooks the Sound and Mount Edgcumbe, with excellent anchorage in front of the house. By the authority of the Lords of the Admiralty, the vessels of the club are permitted to wear the following distinguishing flags."

We omit these, and have only in conclusion to remark, that some of the entries may belong to any day or month of the year as appropriately as to that in which they are located: such, for instance, as an account of the Eccaleobion on the 19th of March. But altogether this is a very useful and amusing volume; and we shall rejoice to see 1841 next Christmas by the same clever and intelligent hand.

#### MISCELLANEOUS.

The New Robinson Crusoe. Pp. 312. London, 1840. Houlston and Co.

THERE never will be a new or another Robin.

son Crusoe, any more than a second Falstaff, Don Quixotte, or Tristram Shandy. The present, meant to be an instructive history for both sexes, has the fault of making the instructiveness too obvious and prominent, whereas the best way is to make interest and entertainment conduce to that effect without the pupil being aware of the fact. Nevertheless, this volume may be beneficially placed in the hands of youth.

*The Ladies' Flower-Garden of Ornamental Bulbous Plants.* By Mrs. Loudon. No. I. London, 1840. Smith.

WE rejoice to see Mrs. Loudon following up her late beautiful work with one of a similar kind on bulbous plants—than which there are none more sweet, more brilliant, or more interesting, in all the dominions of Flora. In her Introduction she justly remarks:—

"Among the other advantages of bulbous plants is the very great one, that many of them produce their flowers in very early spring; at a season when few other plants are in blossom, and yet when flowers are doubly valuable from their rarity. At this season, a bed of crocuses presents a flowery carpet of the most brilliant colours, and borders of hyacinths refresh us with their fragrance, while they enchant us with their beauty. About the same time the bright blue flowers of the scillas burst at once in full perfection through the ground; and a little later these are followed by the fritillarias, the crown imperials, the narcissi, the tulips, and the irises, which in their turn are succeeded by the showy gladioluses and the stately lilies. Interspersed with these come a whole host of beautiful flowers, of which few persons know even the names. The Moræas, the Vieuasseuxias, the Homerias, the babianas, the different kinds of sparaxis, tritonia, and ixia, with many, many others, form altogether a garden of unrivalled richness, which varies every month by a succession of new flowers, every fresh one appearing more splendid than the last."

The first number presents us with splendid Irises, elegant Moræas, and other rarer bulbs; and it is enough to say of the publication, that it is in every respect quite equal to its predecessor.

*The History of England, from the Accession to the Decease of King George the Third.* By John Adolphus, Esq. Vol. I. 8vo. pp. 603. London, 1840. Lee.

FOUR large editions of Mr. Adolphus's *History* shew how much it has been appreciated since its appearance eight-and-thirty years ago; and we rejoice to see the able and worthy author, only these few years older in body, but in mind with nothing but added experience, again in the field, to give the world a more complete history of this eventful reign. Printed uniformly with the last edition of Hume and Smollett, the eight volumes of which it is to consist must indeed be welcome to English literature. In a second preface, Mr. Adolphus points out the various sources from which he has drawn the means to amplify and improve his work; and though we have not had an opportunity to compare this portion of it with the first copy, sure we are that these sources could not have been consulted in the spirit, and with the talent of Mr. Adolphus, without great advantage to his important and valuable undertaking.

*The Interdict; a Novel.* 3 vols. 12mo. London, 1840. T. and W. Boone.

WE have much pleasure in giving our meed of cordial praise to these volumes. The tale is Irish, and the shades of superstition, mixed with the lifelike descriptions of persons and

character, rivet the attention of the reader. The chief interest of the story hinges upon hereditary insanity, and we have rarely met with a more touching picture than that of the beautiful and fated Marion. In it nothing is over-coloured,—from the first indication of the malady to the last sad scene. The gloom of the brother and sister, who are aware of the curse, and determine it shall end with them, though at the sacrifice of warm affections, given and returned, is also well portrayed; their fate we must leave to the reader to discover. Many and various are the other characters; among which, faithful and attached, through weal and wo, Irish servants and dependants stand prominent. We avoid quotation, that we may not interfere with the deep interest of the story.

*The Colonial Magazine, and Commercial-Maritime Journal.* Edited by R. Montgomery Martin, Esq. 8vo. pp. 556, double cols. Vol. I. London, 1840. Fisher, Son, and Co.

THE first volume of this comprehensive and useful publication, though it embraces but four months of the year, contains such funds of information, not only upon all colonial subjects, but upon topics of national interest of every kind connected with our commerce, shipping, and polity, that we cannot sufficiently express our approbation of the manner in which the design has been (so far) carried into execution. The promise of the whole work is greatly enhanced by the value of the portion which has thus already appeared.

*The Orphan of Nepal; a Tale of Hindustan.* Pp. 248. London, 1840. Saunders and Otley.

A PRETTY tale, which all our young lady-readers may take up on our "sayso." Except a Hindu beauty, the characters are not out of the common way, nor do the incidents boast of much novelty.

*Roman Misquotation; or, Certain Passages from the Fathers, adduced in a Work entitled "The Faith of Catholics," brought to the Test of the Originals, and their perverted Character Demonstrated.* By the Reverend R. T. P. Pope, A.M. 8vo. pp. 338. 1840. London, Holdsworth; Dublin, Curry jun. and Co.; Edinburgh, Fraser and Crawford.

THIS is a searching examination of a Roman Catholic text-book, in which the author displays great ability, and no small share of learning. The points discussed are of high religious importance; but, even in a literary point of view, this controversy is eminently entitled to the critical attention of the scholar.

*Reliquie Antiquæ, No. IV.*—By T. Wright, Esq. M.A. &c., and J. Orchard Halliwell, Esq. F.R.S. &c. We hail another No. of this very interesting publication, and hope to pay it our respects more particularly next Saturday.

*Amrin the Stranger; a Poem, by Nafitiernehta Shil-tississimma.* Pp. 40. (London, Hurst.)—An attempt belonging to the Byron school, very irregular, and founded on an Italian romance.

*The Life and Times of Martin Luther.* 8vo. pp. 80, double cols. (London, Green; Bristol, Philp and Evans.) Another Edition. Bmo. pp. 362. (Glasgow, Henderson and Son; Edinburgh, Oliver and Boyd; London, Simpkin and Marshall.)—Under the title of "Standard American Literature" this is a cheap compilation, and furnishes a fair sketch of the great Reformer, and the age in which he flourished.

*Memoir of the Rev. Henry Mowbray.* Pp. 204. (London, Hatchard and Son.) *Persecution of the Lutheran Church in Prussia.* Pp. 144. (London, Hamilton, Adams, and Co.)—The first of these volumes gives us the life of the author of "Der Pfarrer von Andous," and the very religious pastor of Altenhausen. His poetry is held in high estimation, and the writer of the memoir speaks of him in terms of enthusiastic admiration. The other volume unfolds an extraordinary tale of the persecutions endured by the professors of the Lutheran faith in Prussia, their sufferings, and their emigration from their fatherland.

To most English readers, we presume, the details will be altogether new, and they are certainly of deep interest to the religious world at large.

*China and its Resources, &c., with a View of the Opium Question, &c.* by R. Mudie. Pp. 138. (London, Grattan and Gilbert.)—A neat little volume, with a compilation of the intelligence contained in works relating to China, Assam, the opium question, and other topics, thrown upon the surface just now by the events of the times. Two maps add to its utility, and recommend it to the notice of readers.

*Baile's Knowledge and Love Compared, &c.* Pp. 219. (London, Cornish and Co.)—A reprint of the old Worthy's well known publication, with a life of the author by Dr. Adam Clarke.

*Amusement in High Life.* 12mo. pp. 272. (London, G. and A. Greenland.)—Not knowing much of high life ourselves, we can only say that the author, we fear, knows less. These are but poor and insipid sketches.

## ORIGINAL CORRESPONDENCE.

### THE JEWS.

To the Editor of the *Literary Gazette*.

SIR,—The article headed "Sketches" in your number of the 18th inst., in which an account is given of the murder of Father Thomas at Damascus, and which has been sent you by an English correspondent, has caused great pain to those of your readers here, who are in possession of more correct information as to the truth of that case. I shall take the liberty of addressing to you a few brief remarks on this subject, but will content myself with observing for the present, that independently of the reprobation with which such a tissue of palpable falsehoods as the whole story is made up of, has been met by the best-informed publicists connected with the East, and especially with Syria, "The Austrian Observer," the official paper of Vienna, a journal that has never been known to commit itself, has published an official report from the Austrian consul at Beyruth, stating that the murderers of Father Thomas are not the Jews; that the bones found in the sewers have been proved by medical men not only to have lain there a long time, but also not to be human bones; and that the whole accusation is a device of the local authorities to extort money from the wealthiest inhabitants of Damascus;—the charge being, as you justly observe, just such an one as those that led in the middle ages to Jewish massacres.—I remain, Sir, your most obedient servant, and constant reader,  
PHILEATHES.

Paris, April 21, 1840.

## ARTS AND SCIENCES.

### ROYAL GEOGRAPHICAL SOCIETY.

[Concluded from page 248.]

1. A letter from John Holmes, Esq. of the M.S. department, British Museum, 'On the *Cartes Catalanes* in the King's Library at Paris.'—"My dear sir, you are well aware that of late various French writers, Malte Brun, Buchon, Huot, Paulin - Paris, &c., have asserted that it is to the Catalan inhabitants of Majorca, and not as it was before believed, to the Portuguese navigators,

\* We have inserted this letter, though anonymous, because the subject is one of very great interest; and we rather expected that some of our friends at home, of the Jewish persuasion, would have put it in our power to make a few remarks upon the extraordinary statement in our last, which could not be refused by any journalist, coming vouched, as it did, to us. We observe, from other publications, that the Hebrew people have not been remiss in contradicting the representations of their enemies. The governor of Damascus asserts that 134 children have disappeared in the course of years, of whom no traces are left; and he seems to attribute their loss to the Jews. On the other hand, the chief Rabbi at Smyrna has sent forth a publication to shew how unjust and unfounded the whole story about the Easter blood is; and at a meeting in London of Rothschilds, Monteiores, Goldsmids, Salomons, Cohens, and other eminent persons, they have agreed to apply to the Secretary for Foreign Affairs to interfere against the perpetration of barbaric cruelties under such pretences as disgraced the dark ages, when the belief in such atrocities was, in like manner, assumed as a ground for persecuting, torturing, murdering, and plundering the Jews.—Ed. L. G.

of the school of Don Henry, that the credit is due of having discovered the north-west coast of Africa, from Cape Nun to Bojador: that the plane chart was not invented at the Nautical Academy of Sagres in the Algarves, but by the Catalans; that to them the Island of Madeira was well known under the name of the *Isola di Legname*; and that they were familiar with these facts, at least half a century earlier than the rest of Europe, or even than the supposed Portuguese discoverers. Malte Brun allows that the Catalan voyages 'are indicated only by geographical charts, and are destitute of other certain historical proof.' The authenticity of these charts and their real date are, therefore, matters of some importance. The charts exist in the *Bibliothèque du Roi*, in a MS., to which Malte Brun assigns the date of 1346, whereas none of the facts which it is made to prove were understood to have been known until about 1420 or 1430—a difference of three-fourths of a century. His recent editor, M. Huot, leaving Malte Brun's original statement untouched, describes the charts a second time, not recognising their identity, and attributes to them the date of 1374: thus making them answer a double purpose. M. Huot copies a memoir, communicated to him by M. J. A. Buchon, *Inspecteur des Archives du Royaume*, which had been read before the Institute, and which is the foundation also of M. Paulin-Paris's account. I must confess that I looked at first with some suspicion upon a statement which flatly contradicted the hitherto unquestioned authority of early, if not contemporary writers. The evidence upon which it is founded appeared to me inconclusive in itself, and to be in part based upon gross error. Passing over its variance from the accounts of Barros and other writers, I cannot conclude with MM. Buchon and Huot, that from the language in which the charts are written they are Catalan or Castilian, and, therefore, the work of the mathematicians of Majorca; still less can I agree with them, that because 'the Christian flag' is over Cyprus, therefore they cannot be later than 1375, in which year Cyprus was conquered by the Sultan of Egypt! The language is that mixture of dialects chiefly Spanish and Italian, which was known as the Romans' over a great part of the south of Europe, and particularly on the shores of the Mediterranean, where much of it still remains in the *Lingua Franca*. I have now before me a MS. in the same dialect, written about 1450, calling itself *Roman*. As for Cyprus, it was 'Christian' in 1375, under the Lusignan family, and it still was 'Christian' in 1475, when it passed from that dynasty to other 'Christians,' the Venetians, from whom it was not taken till 1570, and then not by a 'Sultan of Egypt,' but by Mustafa, the general of Solymann II., the grand signior of the Turks. Surely M. Buchon cannot have meant to allude to the short-lived invasion of Cyprus by the Genoese! The only other proof which is offered of their early date is, that the calculations of Easter-day begin in 1376: I will merely remark, that at least it was not unusual to make these calculations backwards as well as forwards—a practice of which I can shew instances in the fifteenth century, and which is common at the present day. An error, which tends to strengthen my doubts, occurs in all the statements of these writers whom I have named, viz. that only two charts of early date are known: one by Visconti in 1318 (three years prior to Marino Sanuto); another by Benicassa in 1370, both in the library at Vienna. Now of this last geographer I know

of eight charts, all dated between 1466 and 1489; three of them are in the British Museum, two at Paris, two at Venice, and one in the Vatican. Here is a probable error of a century in date. It is only within a few days that I have seen M. Buchon's lithographed copy of these charts; it is difficult to judge with exactness of the age of MSS. by mere outline facsimiles, but my opinion of the writing is, that 1440 is about the real date. The Christian flag over Cyprus is evidently intended either for the arms of Jerusalem, borne by the Lusignan family, or for that of the Emperor of the East; the fact is not of much importance, but the MS. itself would probably shew whether cross-crosslet or betas are meant. The best test was a comparison of the north-west coast of Africa with the chart of Andrea Bianco, of the undoubted date of 1436. The outline of that coast, the Canary Isles, and Madeira, so closely agree, that it might be supposed they were taken from some common original, the names being changed according to the language of the copyist. Would such close agreement exist between charts of 1375 and 1436, when we consider what had been done in those sixty years? But, putting all details aside, could the discoveries of 'the Catalans,' thus reduced into writing in 1375, have remained unknown to Don Henry, and those of his academy? with whom even M. Buchon not only allows that 'the Catalans' were in relation, but he also quotes Andres to prove that a native of Majorca was chosen to superintend the Nautical Academy of Sagres at its first foundation by Don Henry, in 1415, a period of forty years after the supposed date of these charts. Again, is the evidence of the early date of these charts, whether according to Malte Brun in 1346, or according to Buchon, Huot, and Paulin-Paris, in 1375, sufficiently clear and decisive to overcome the united testimony of all authors who have written on the subject? M. Paulin-Paris, whose book was published in 1836, says that M. Jomard, 'Directeur du Cabinet des Cartes et Plans de la Bibliothèque du Roi,' was engaged in researches upon these charts, and that he purposed to publish the results; I cannot find that such has been the case: he may have resolved the doubts which I have expressed. The charts are, however, mentioned in the report just made by M. Sabin-Berthelot to the Geographical Society of Paris, on the geographical collections of the *Bibliothèque Royale*, where they are called 'a remarkable work of the 14th century (1375),' and are enumerated amongst the early monuments of geography,—indeed as the earliest originals which the *Bibliothèque du Roi* possesses; those previously described in the report being printed, or manuscript copies from other libraries. One is the copy of the early rectangular map in the Cottonian library, which was made in 1830 by Mr. Walker of the Admiralty, under the direction of Sir John Barrow, for M. Jomard. It has since been engraved in the 'Penny Magazine.'—I am, &c. JOHN HOLMES.

"To Captain Washington, R.N."

2. From Dr. Grant, dated Urumiyah, Jan. 3. Communicated by Col. Shiel.—"In my journey through this part of Kurdistan," says the writer, "I found Akereh by my bearings to lie north-east, about thirty miles from Mosul; and from the former place, Amadiyah, bore a little to the west of north, twenty-two hours distant. From the castle of Amadiyah the Zab is distinctly visible, distant about ten miles to the E.N.E. The Zab and the Hakari rivers are the same. The Khabur is distant

from Amadiyah twelve hours; it rises one day's journey E.N.E. of Julamerik. The Zab is an exceedingly rapid river, and runs over a rocky bed. I followed its course to Julamerik, and then to near its sources west of Selmas. I never felt so much the value of my medical character as in my trip across the mountains, a journey which, with the time I spent with the patriarch, &c., occupied just two months. During all this time I received the kindest assistance from Christians and Kurds, a circumstance which I attribute mainly to the fact that I was well-known by reputation in that region. I met with some of my old patients in the extreme western limit of Tiya'ri, and through the whole of the Hakari country, so that I was welcomed as a friend and benefactor. I found the country of the Nestorian Christians as rough and difficult as I could well have conceived, but I did not mind walking a few days in such an interesting region, and I soon found that I could walk over the long, bare poles, which in many cases serve as bridges, almost as well as a native. The people of Tiya'ri are of a noble race, but as wild and independent as the mountains they inhabit. They have no tradition of their country ever having been invaded, and they say the armies of Mohammed and Omar could not reach them. Their dialect differs considerably from that of the people of Urumiyah, and the intonation of voice much deeper and stronger. At the same time there is an independence in their whole deportment, such as I have seen among no other native Christians of the East. Their principal wealth consists in their flocks, but they cultivate rice, millet, and grapes in abundance; and the land is almost literally flowing with milk and honey, which I ate twice every day regularly, for more than a month, while with the patriarch. Political and other changes will probably open this region to the traveller ere long. At present the apprehension of change makes the Kurds much on the alert, while the Christians are desirous that the whole country should come under a Christian government, and would readily co-operate with any foreign power for this object; and most efficient auxiliaries they would be in such a country.—3. 'Notes on a Journey from Saucedá, near Zacatecas, in Mexico, to the Mining District of Catorce,' by Major Charters, R.A. Journeying in an east direction for forty miles, over a barren plain, where a few stunted palms and the cactus are the only traces of vegetable life, the traveller reaches the mining town of Ramos. The mines here are in one principal vein; there are eight shafts, the deepest 390 yards, and consist of argentiferous copper pyrites and copper glancing, chiefly in clay slate, with a surface coating, twelve yards thick, of compact lava; this covers a small extent of country around Ramos, of which the volcanic hill of Zamora, half a mile to the south-east, would seem to have been the centre. There are two other hills of the same nature near Ramos, one of which, to the E.N.E., is named La Canterna, from the building material there obtained. It is worthy of remark that the volcanic mass covers the metalliferous vein, which has been worked to a considerable depth; the plain between Saucedá and Ramos is covered with a thin deposit of calcareous tufa, which, in the dry season, is easily reduced to powder, and is very disagreeable to the traveller. Major Charters had remarked a similar calcareous deposit in many parts of the South African plains, and asks what may be the origin of these widely-extended deposits, far removed from any mountain of a similar nature? From

Ramos the road turns north-east to Cornejo, at ten leagues' distance, a few huts on the edge of a freshwater lake, about two miles long, which has neither inlet nor outlet; the water is extremely good, and a valuable treasure on these arid plains. The same calcareous deposit extends thus far, and here covers a beautiful breccia. Continuing in the same direction, the traveller passes the lone house called San Juan de Tusal, near the base of Mount Venado; then the farm of Mingale; and some leagues beyond, the gorge in a mountain-ridge called El Puerto de Mingale, on debouching from which the whole range of the Catorce group becomes visible in the distance. Seven leagues further over the plain brings you to the small town of Catorce, situated at the foot of the mountains; while, higher up, at an elevation of 8575 feet above the sea, is the mining town of Real de los Alamos, containing 10,000 inhabitants. This group of mountains so far resembles that of Zacatecas, that it is unconnected with any other range, and rises directly from the surrounding plains; and this seems to be the distinguishing character of the metalliferous mountains of Mexico, with the exception of Bolaños, which belongs to an extensive chain. It is, however, dissimilar from the Zacatecas group, both in external appearance and formation: it is on a much bolder scale, and some sections of the limestone strata are here extremely magnificent. The mineral wealth which has been produced by it has been very great; so much so as to give it the third, if not the second, rank amongst the mineral districts of Mexico. The limestone, which forms the principal character of this group, appears to rest on clay-slate; and the miners have taken full advantage, as well of its deep ravines as of the nature of the rock, to drive great adits; that of the principal mine, called La Luz, is six yards high, six wide, and 1100 in length, and cost about 30,000*l*. The principal workings are above this, so that the stuff is let down from above, and carried out in horse-carts, at a brisk trot through the adit. In this group of mountains there is also a volcanic mountain, similar in appearance to that at Ramos, although on a larger scale than the Zamora. Among the donations on the table, besides the topographic atlas and model in relief of Bavaria, was a detailed map and memoir upon the environs of Khiva, by M. Zimmerman of Berlin, presented by Baron Humboldt; a map of the Duchy of Salzburg, in fifteen sheets, and of Austria Proper, in thirty sheets, by the Bureau Topographique, presented by M. Löwenstein of Vienna; and an atlas of Tuscany, in twenty sheets, by Zuccagni Orlandini, presented by M. Berardi in the name of the author.

#### SOCIETY OF ARTS—NEW VOLTAIC BATTERY.

At the last evening meeting of the Society, after a lecture on the polariscope by Mr. Goddard, Mr. Alfred Smee exhibited his new and powerful galvanic battery. The peculiarity of construction in this battery, as explained by Mr. Smee, consists in coating the negative plate with a layer of finely divided platinum, which not only insures perfectness of contact with the exciting liquid, but, from the infinity of points which it presents, causes the most violent action. The battery exhibited consists of twenty-four small plates, and the most magnificent effects are produced on connecting the battery with an electro-magnetic machine; the combustion of the different metals resembles a display of fire-works. The advantages of this form of battery are in being able to employ

dilute sulphuric acid as the exciting liquid—thus effecting a considerable saving; and the little trouble to keep it in order, as the action ceases immediately the circuit is broken; and although it may not be used for any length of time, it only requires to be again immersed in the liquid, and the action is as violent as ever.

#### ZOOLOGICAL SOCIETY.

MR. WISHAW in the chair.—A letter from the Society's corresponding member, R. Mackay, Esq. Her Majesty's Consul-General at Maracaibo, was read. It refers to an insect presented by the writer to the Society, in the body of which a kind of plant had taken root. —Mr. Waterhouse observed that the insect in question was apparently the larva of one of the *Lamellicornes*, and that on one side of the body, springing partly from the thoracic segments of the abdomen, were about six sprouts of some vegetable, probably of the genus *Clavaria*. The longest of these sprouts is about one inch in length; they are cylindrical, bent in an irregular manner, have no branches, and, for the most part, are joined together near and at the root. He also observed that numerous similar instances of insects having this kind of vegetable production attached to different parts of the body were on record—he might refer to the well-known instance of the caterpillar found in New Zealand, an account of which is published in the "Transactions of the Entomological Society," where will also be found references to several other cases. That the dead body of animals constituted a substance fitted to nourish a vegetable, is not extraordinary, but in the letter from Mr. Mackay, it is stated that the insect was alive when first found, and this is by no means a solitary instance in which these vegetable productions have made their appearances on living insects. These facts, combined with others which tend to shew that, to a slight degree, there is an independent existence in the different parts of the same insect, where life is retained for a considerable time in parts, although they may be separated, are highly interesting in a physiological point of view.

#### STATISTICAL SOCIETY.

MR. TOOKE in the chair.—The Chairman announced that H.R.H. Prince Albert had consented to become the Patron of the Society. Fellows were elected. Paper read, entitled 'On the Sickness and Mortality in Western Africa,' by Major Tulloch. It may be premised, that the object of the present communication is to submit a brief statement of the principal facts contained in a report on the health of the troops in Western Africa, recently presented to parliament, combined with a few observations, to which the consideration of that subject naturally gives rise. Passing over a few geographical details, already known to intelligent readers, we proceed to more general topics. The whole of the British stations or settlements lie within the tropics. The climate is chiefly distinguished for its extreme moisture; upwards of 300 inches of rain has frequently fallen during the wet season, and more has been measured in the course of two nights than falls in Great Britain in the course of a year. The temperature is rather under than above the average in similar latitudes; but except at Sierra Leone, it is subject to rapid alternations. The operation of none of these supposed agencies, however, is sufficient to account for the extreme hostility to the European constitution, manifested by the climate of this coast. It is indeed one of

the most remarkable phenomena in the vital statistics of our race, that a line of coast some thousand miles in extent, and exhibiting every possible variety of soil, geological structures, position, and physical aspect, should, in this respect, present so singular an uniformity. The deadliest poison could hardly exercise a more certain or more direful influence on the human frame, than has been manifested in these pestilential regions; on several occasions, when four-fifths of all those attacked by fever died under treatment, the remainder were so broken in constitution that few, if any, of them survived to reach their native land. Were this extreme degree of insalubrity continuous, the whole population must speedily become exhausted, and pestilence would cease for want of victims. Gold would be inadequate to tempt, or necessity, however dire, to compel our countrymen to brave the atmosphere of such a charnel-house; but the unhealthy character of this coast is subject to most singular fluctuations, so that a year which has perhaps proved fatal to the greater number of the European inhabitants is not unfrequently succeeded by several of comparative salubrity, during which, Fever, that scourge of the colony, is either absolutely unknown, or assumes so mild a form as to be no longer dreaded. During this period fresh bands of adventurers find their way to the coast, who, experiencing none of those fatal epidemics which they had been led to expect, are more inclined to attribute the fate of former residents to acts of commission or of omission, than to the agency of climate, and flatter themselves that by a different course of life they will succeed in keeping the enemy at a distance. Deceived by a succession of healthy years, our ingenious author has even endeavoured to prove that, so far from this colony deserving its usual epithet of "The white man's grave," it surpasses most tropical regions in salubrity; and his residence there being but short, he had the good fortune to escape without exhibiting in his own person a proof of the inaccuracy of his theory. On the long average of eighteen years, that is from 1819 to 1836 inclusive, about one half of the white troops were cut off annually, and in 1825 and 1826 nearly three-fourths of them perished. This refers to the white troops employed at the three stations of the Gambia, Isles de Loas, and Sierra Leone. Other tables bear sickening testimony to the same effect. Yellow fever is the great scourge. The other classes of diseases do not call for any particular notice; those of the lungs appear to be comparatively rare, while those of the liver are more frequent and fatal than has been observed in any other climate except the East Indies. The proportion of deaths by diseases of the brain was unusually high; but, considering the frightful extent to which intemperance was carried among the troops, and that the greater part of the fatal cases occurred while the parties were in a state of intoxication, this might, perhaps, be accounted for without referring to the agency of climate.

#### DISCOVERY OF THE NORTH-WEST PASSAGE.

"THE great geographical problem of the last three centuries has at length been solved, and we are proud to say by Englishmen; and still more proud, perhaps, that it has been the result of the ardour and enterprise of a private company, than even if it had been the honourable fruit of a government expedition. The sentiment may be badly expressed, but we are sure that the feeling is right. The triumph of

individual energy, in instances like the present, illustrates the national character more fully—'tis the growth of the soil.

"Our readers will have anticipated that news must have arrived at the Hudson's Bay House from the enterprising and intelligent officers of the company, Messrs. Dease and Simpson, whose Arctic discoveries in 1837 and 1838 have already added so materially to our geographical knowledge. A despatch from those gentlemen was published in a second edition of yesterday's 'Times;' and it is to this source that we are indebted for the following particulars.

"Messrs. Dease and Simpson descended the Coppermine River on the 22d of June, last year, on their third and happily most successful expedition. On the 18th of the following month they reached Cape Barrow, and had the satisfaction of finding Coronation Gulf partially open; 'whereas,' says the despatch, 'long after the same date, in 1838, the whole party might have crossed it on foot.' They then doubled Cape Alexander amidst very heavy driving ice. 'From Cape Alexander, situate in lat. 68° 56' N., long. 106° 40' W., to another remarkable point in lat. 68° 33' N., long. 98° 10' W., the Arctic coast may be comprised in one spacious bay, stretching as far south as lat. 67° 40', before it turns off abruptly northward to the last-mentioned position. This vast sweep, of which but an inconsiderable portion was seen by Mr. Simpson last year, is indented by an endless succession of minor bays, separated from one another by long narrow projecting points of land enclosing an incalculable number of islands.'

"To reach the last-named point they had to thread a very intricate navigation; but on making it, they suddenly 'opened a strait running in to the southward of east, where the rapid rush of the tide scarcely left a doubt of the existence of an open sea leading to the mouth of Back's Great Fish River. This strait is ten miles wide at either extremity, but contracts to three in the centre. Even that narrow channel is much encroached upon by high shingle islands, but there is deep water in the middle throughout.' Soon after this, that is, on the 12th of August, they were visited by the most terrific thunder-storm which they had ever witnessed in these regions: and, on the 16th, the adventurous party 'breakfasted on the identical spot where the tent of our gallant, though less successful precursor (Sir George Back) stood, on his return from Point Ogle to the Great Fish River, that very day five years before.'

"Here we cannot do better than quote again from the despatch, which proceeds to state:—

"The arduous duty we had, in 1836, undertaken to perform, was thus fully accomplished; and the length and difficulty of the route back to the Coppermine would have amply justified our immediate return. We had all suffered more or less from the want of fuel, and the deprivation of warm food, and the prospects grew more cheerless as the cold foul weather stole on apace; but having already ascertained the separation of Boothia from the American Continent, on the western side of the Great Fish River, we determined not to desist till we had settled its relation thereto on the eastern side also. A fog which had come on dispersed towards evening, and unfolded a full view of the picturesque shores of the estuary. Far to the southward Victoria headland stood forth, so clearly defined that we instantly recognised it by Sir George Back's exquisite drawing. Cape Beaufort we almost seemed to touch, and with

the telescope we were able to discern a continuous line of high land as far round as north-east, about two points more northerly than Cape Hay, the extreme eastern point seen by Sir George Back.

"Directing their course to a bold promontory, the farthest land in sight, they there landed, erected a conical pile of ponderous stones, fourteen feet high, placing under it a sealed bottle, containing a sketch of their proceedings, and, amidst a salvo of shot and enthusiastic cheering, took possession of their discoveries 'in the name of Victoria the First.' This bold promontory they named Cape Britannia, and its position is N. lat. 68° 3' 56", W. long. 94° 35'. The coast trended away from this north-east, and they ran along it forty-three miles further, to the mouth of a small river, the position of which they determined to be N. lat. 68° 28' 27", W. long. 97° 3'; this was the term of their voyage. 'From a limestone ridge, about a league inland from the mouth of this river,' says the despatch, 'we obtained a view of some very remote blue land in the north-east quarter, in all probability one of the southern promontories of Boothia. Two considerable islands lay far in the offing, and others high and distant, stretched from E. to E.N.E. Our view of the low main shore was confined to five miles in an easterly direction, after which it appeared to turn off greatly to the right. We could, therefore, scarcely doubt our having arrived at that large gulf uniformly described by the Esquimaux as containing many islands, and with numerous indentations stretching down to the southward till it approaches within forty miles of Repulse and Wager Bays. The exploration of such a gulf, which was the main object of the Terror's ill-starred voyage, would necessarily demand the whole time and energies of another expedition, having a starting or retreating point much nearer to the scene of operations than Great Bear Lake; and it was quite evident to us that any further foolhardy perseverance could only lead to the loss of the great object already attained, together with that of the whole party.' The voyagers therefore wisely determined to return; and they began to retrace their steps on the same day, the 20th of August. Our space will not allow us to accompany them in their voyage homeward, during which we regret to find the party suffered extremely from the excessive cold. Their course home took them through the Great Bear Lake, and down the Mackenzie, and they finally reached Fort Simpson on the 14th of October—having been nearly four months engaged in an expedition, the difficulties, perils, and sufferings of which, nothing but an Arctic voyage we presume can give the imagination any idea of.

"Although hard pressed for space, we must quote the concluding passage of the despatch, as it shews the indomitable spirit of the men:— 'We rejoice in having anticipated the Russian expedition, and secured to our country and the company the indisputable honour of discovering the north-west passage, which has been an object of search to all maritime nations for three centuries. When our expedition was planned at Norway House, in 1836, it was confidently expected that Sir George Back would have achieved the survey of the Gulf of Boothia with the Vernon boats, and that our meeting at the mouth of the Great Fish River would have left no blank in the geography of Northern America. That officer's failure, the exhaustion of our men and means, and the necessity of a new wintering ground, render a fresh expedition indispensable for the examination of the

gulf of Boothia, the circuit of which to the Strait of the Fury and Hecla, according to the Esquimaux accounts, cannot be less than 400 or 500 miles, it only remains for us to recommend to your approbation the plan proposed by Mr. Simpson to perfect this interesting service, which, as he had no wish to avail himself of the leave of absence granted, he is prepared to follow up whenever the limited means required are placed at his disposal.'

"The italics, we need hardly say, are our own."—*John Bull*, from "The Times."

#### PARIS LETTER.

Academy of Sciences, April 21, 1840.

SITTING of the 13th April.—M. Morlet addressed a note to the Academy relative to certain observations made upon the Aurora Borealis, and especially to certain methods of attempting to ascertain the altitude of these meteoric phenomena, which had been ordered to be adopted during some recent scientific expeditions. He contended that the plan of using co-ordinates of altitude and longitude had been first suggested by him, and that he ought to have the credit of it, as well as of the method of parallaxes. M. Arago said that the first of these methods was so simple that no person, having any knowledge of astronomy, could well avoid employing it, and that M. Morlet could hardly establish any claim of originality in the matter. As to the second, the doubts expressed by many men of science, as to whether each observer did not see his own separate aurora borealis, just as each person saw his own separate rainbow, took away from the use and merit of the method.

M. Coligny wrote to the Academy on the subject of a double-acting hydraulic machine, of his invention, which he had previously submitted to its notice; he stated that by this machine as much water might be raised from a lower to a higher level, by means of an oscillatory movement, with a smaller amount of resistance, as by a continuous movement.

M. Julien read an interesting memoir upon the wax-producing insect of China, noticed in a former sitting. He had examined a considerable number of Chinese books on this subject, and had found that the insect was known and employed in China in the seventh century of the Christian era; numerous directions for its cultivation and utilisation were contained in works of the thirteenth century, together with detailed descriptions of the plants on which it lived, their mode of cultivation, &c. It was extremely difficult to identify these plants from the descriptions given, but M. Adolphe Brongniart had thought he recognised two species, the *Rhus succedaneum* and the *Ligustrum glabrum*. Another plant was probably of the same family as the *Hibiscus Syriacus*.

M. Seguié communicated to the Acad. my some exquisite specimens of photographic images, obtained by the daguerreotype at Rome. Among them was one, the copy of a painting by Raphael, of extraordinary firmness and clearness. A discussion afterwards ensued on the failure of the daguerreotype in representing insects and small anatomical preparations, for purposes of natural history. The conversation was not interesting in itself but it ultimately turned upon a discussion upon the definition of art as applied to painting, &c. between M. Turpin and M. Poinso, the celebrated mathematician. To the surprise of the Academy, the latter gentleman, who was always considered as a mere "function of mathematical formulae," broke out into a most eloquent discourse on the true nature and ob-

ject of art, in which he defined its imitative object with a warmth of feeling, and a spirit of poetical perception, that astonished all who heard him and excited universal admiration.

M. Dupin presented to the Academy a work on the influence of factory labour upon the bodies of children, and their ulterior development. In giving a sketch of the object of the work, M. Dupin mentioned that it had been considered desirable to ascertain the difference of strength and of general soundness of constitution in young men belonging to agricultural and manufacturing districts; and the means adopted to obtain this information was the examination of the results of the council of revision for the recruits drawn for the army in various departments. The returns made in these cases were perfectly free from all suspicion of relative incorrectness, since they were made for a military, not a manufacturing purpose. They had taken ten agricultural and ten manufacturing departments; the latter had shewn for the same extent of area ten times the number of licensed dealers in the former, and nine times the amount of money paid for such licenses; but in the ten agricultural departments, for 10,000 young men capable of undergoing the fatigue of military service, and as such admitted into the ranks, there had been 4020 rejected as weak or deformed; whereas in the ten manufacturing departments the number rejected was 9930. Some of the extreme cases were the following:—For 10,000 young men in robust health and well formed, there were in the manufacturing departments of

The Marne.....10,309 } weak or deformed.  
The Seine inférieure 11,980  
The Eure.....14,451 }

For 100 young men in robust health and well formed, there were in the following manufacturing towns

Rouen.....170 } weak or deformed, not exceeding  
Elbeuf.....170 } twenty years of age.  
Bulbec.....500 }

—M. Leymerle sent a memoir to the Academy 'On the Geology of the Cretaceous District of the Aube.' In this work he compared it with the chalk districts of England and Normandy, and shewed that the lower portions of the cretaceous formations of the Aube were contemporaneous on the one hand with the neocomian district of Switzerland, and on the other with the wealden formation of England. A considerable number of sections and views, a geological map of the district, and a general table of the fossils, accompanied this memoir. The table contained 313 species in all; of which the author considered no less a number than 126 to be new.

M. Von Buch, the eminent geologist of Berlin, has been elected foreign member of the Academy in the room of the late M. Blumenbach. The name of the French member last elected was Piobert, not Robert.

*Société de Géographie.*—This Society held a general assembly on the 10th of April. An immense number of maps and works of geography had been presented to the Society, as the Secretary stated, during the past year: among the most valuable of which was a collection of 500 maps of Russia, presented by Count Anatole Demidoff. Ten of these maps, relating to parts of Central Asia, were of the highest interest.—Brief notices were read by M. Jomard of the principal voyages and travels made during the year: among which those of M. Schomburgk, in Guiana; of Mr. Hamilton, in Asia Minor; of Mr. Thompson, in Persia;

Mr. Holroyd, in Nubia; Captain Alexander, in Southern Africa; and Messrs. Combes and Tamisier, in Egypt and Abyssinia; were particularly mentioned.—Notice was taken of the third volume of Carsten and Niebuhr's travels in Arabia; and of the survey, now completed, of the northern and western coasts of France, by M. Beautemps Beaupré.—M. Galindo, of Guatemala, had sent a valuable collection of drawings, &c. relating to the indigenous tribes of Guatemala, Yucatan, &c.—The Society has decreed a prize of 1000f. for the most useful discovery made by any traveller during 1838: and the Duke of Orleans has proposed a prize of 2000f. for the same object for 1840.—Two gold medals are to be given for the best barometrical measurements of the elevations of the lines of division of the basins of France.

The Minister of Public Instruction has just laid before the Chamber of Deputies bills for granting 5000f. per annum to a professor of Slavic literature, at the Bibliothèque du Roy; for granting 58,200f. towards the formation of a faculty of medicine at Rennes; and 25,000f. for forming a faculty of sciences in the same town.

The *Académie des Jeux Floraux* of Toulouse awarded its annual prizes on the 10th instant. They were eight in number: among the successful articles were several pieces of good poetry, which were rewarded by gold lilies bestowed on their authors.—A prize was adjudged to an elaborate eulogium, in prose, on Raymond des Gilles, count of Toulouse.—The prize of the *églantine dorée* was not awarded this year: a silver *penée* was given in stead.

*Books.*—The last number of the "Journal des Savans" contains a learned essay, by M. Letronne, on the history of the geography of the Americas, and on the progress of astronomy during the fifteenth and sixteenth centuries.—M. Biot has contributed a review of the "Chinese Chronology" of M. Ideler.—M. Buchon's "History of French Domination in the Provinces of the Byzantine Emperor, after the Fourth Crusade," is well spoken of. It contains a great number of quotations from rare and original documents.—A useful book on Greek roots (Greek books are uncommonly rare in Paris) has just been published by M. Marcella, in which he compares the primitive Greek words with those of the Sanscrit, and other Oriental languages. The second part of his work contains an etymological grammar, and extensive tables.—An able defence of the conduct of Marie Antoinette (if, indeed, that conduct needed any apology), during the Revolution, has been produced by a lady, Madame Simon Viennot, who is of the liberal school of politics. She defends the cause of the Revolution, and vindicates, at the same time, the unfortunate queen from the accusation of behaving with bad faith towards the leaders of the popular party. One of the most interesting parts of her work is where she touches on the queen's negotiations with Mirabeau. Had that great man lived he would certainly have put down the Revolution, the effects of which he had already begun to feel.

The *Institut Historique* has appointed as its officers for the present year—*Honorary President*, the Duke de Doudeauville; *President*, Baron Taylor; *Secretary*, Mous. E. Garay de Monglave.

It was decided the other day, in a law suit before the Royal Court of Brest, brought by two female relations of the unfortunate circumnavigator Lapérouse, that the correct orthography of the name was as thus given, and not as it has been commonly written, La Peyrouse.

The Chevalier Gasse, architect to the King of Naples, corresponding member of the Institute of France, and of the Society of British Architects, died at Naples on 21st February, aged sixty-one. The palace of the minister of finance in that capital was erected from his designs.—M. Gence, formerly archivist of the Dépôt des Chartes, editor and translator of "Imitatio J. C.," died a few days since in Paris. This gentleman, by his learned researches, contributed greatly towards restoring this work to its true author, the Chancellor Gerson.

*Sciarada.*

Qual fra l'erbe e i fior montani  
Spande l'un soave odor,  
Tal dee l'altro fra gli umani  
Spirar l'aura dell'amor.  
Qual se pon la sua fidanza  
Solamente nel total;  
Coll'amor, colla speranza  
Si governa ogni mortal.

Answer to the last:—Fa-va.

#### LITERARY AND LEARNED. SOCIETY OF ANTIQUARIES.

On Thursday, St. George's Day, the Society held the annual meeting, pursuant to the charter, for the election of President, Officers, and Council, Mr. Hudson Gurney in the chair,—when the President, Treasurer, Director, and Secretaries, were re-elected.—The Council are, the Earl of Aberdeen, Thomas Amyot, Esq., Charles F. Barnwell, Esq., John Bruce, Esq., Decimus Burton, Esq., Nicholas Carlisle, Esq., T. Crofton Croker, Esq., Sir Henry Ellis, K.H., Thomas Earl de Grey, Hudson Gurney, Esq., Henry Hallam, Esq., William Richard Hamilton, Esq., the Rev. Joseph Hunter, Sir Frederick Madden, K.H., Dr. Merewether, Dean of Hereford, Thomas Phillips, Esq., John Gage Rokewood, Esq., Charles Roach Smith, Esq., Sir Richard Westmacott, Knt., the Right Honourable C. W. Williams Wynn, and Charles George Young, Esq.; those in Italics being the new Members of the Council.—Sir Henry Ellis announced the death of twenty-eight fellows of the Society during the last year, and three withdrawn; also the election of twenty-three new fellows, and one honorary.—In the evening, a good muster of the Society dined at the Freemason's Tavern.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Geographical, 9 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday.*—Medical and Chirurgical, 8½ P.M.  
*Wednesday.*—Zoological (Anniversary), 1 P.M.; Society of Arts, 7½ P.M.; Geological, 8½ P.M.  
*Thursday.*—Royal, 8½ P.M.; London Institution (Anniversary), 12 P.M.; Royal Society of Literature (Anniversary), 3 P.M.; Numismatic, 7 P.M.  
*Friday.*—Royal Institution, 8½ P.M.

#### FINE ARTS.

#### NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

[Third Notice.]

221. *On the Coast of France: Sunrise.* H. Bright.—Surely the name of the artist has influenced or is reflected in his works; for be it observed, brilliant as this scene is depicted, it is one of the most soft-toned of his performances in this Exhibition, as will be seen by a reference to those under his name in the North Room and other parts of the Gallery.

22. *View on the Lago di Garda.* T. F. D'Egville.—We understand this artist to be a new member, and we presume this is a first appearance; if so, from the talent displayed in the work before us, Mr. D'Egville is evidently an acquisition to the Society.

198. *Interior of the Great Hall of Plas*

*Mawr, Conway.* E. H. Wehnert.—As in life, so in a collection of pictures, we often pass from an agitated to a tranquil scene; and such is the case in the present instance. Pleasing and attractive from its picturesque grandeur, over which the artist has thrown a magical effect of light that shews the vigilant attention with which he has observed such luminous appearances.

226. *The Page.* H. P. Rivière.—Ay, and the prince of pages we see in this graphic illustration of the character; the beauty, modesty, and grace of which, we feel assured, must attract universal admiration.

175. *Fowls, and Interior of Stable.* E. Duncan and C. H. Weigall.—We do not deny Mr. Weigall's talents in his battle, or council-room, with reference to Nos. 111 and 123; but for our part we prefer to encounter him in the poultry-yard or the stable, where, and especially with such an auxiliary, he is quite at home—at least to our homely fancy.

109. *An Arab presenting a Tribute to Sidi-Hadj-Abd-el-Kader-Mahidin.* H. Johnston.—There ought to be something in a name, for it has cost us some trouble in transcribing this from the Catalogue. However, the character of the performance will bear us out in selecting it as a work of art; rich in its originality, breadth, and other qualities in painting. By the by, the tribute is the head of an unfortunate victim!

214. *Bolton Abbey.* G. B. Campion.—We think the artist has been very happy in his choice of the portion of this picturesque and interesting ruin, surrounded as it is with the richest and most luxuriant foliage—a scene at once of grandeur and retirement, alike pleasing to the eye and soothing to the mind.

228. *Church of St. Lawrence, Rotterdam.* G. Howse.—Of such structures and their characters we think we may say they are indigenous to our exhibitions; and wherever we see them represented in the style of the present performance, we are at once struck with the grandeur and awful solemnity of the stupendous pile, and the apparently contemptible littleness of the creatures moving at its base. But when we recollect the intellectual faculties of the species who reared the mighty mass, the dignity of human nature rises to our view, and we exclaim with the poet,

How poor, how rich, how abject, how august,  
How complicate, how wonderful is man!

Mr. Howse has sprinkled the exhibition with numerous examples of his versatile genius; but, genus as they are, we cannot help wishing them larger in their dimensions.

162. *"Love me, love my Dog."* L. Hicks.—Something appears to have occurred in the shape of neglect on the part of the lover to have called forth the rebuke, for such it evidently is from the expression of the lady, as well as the offender's conciliatory behaviour to the little canine favourite. But on as trivial events often hang most important consequences. The picture is executed in the artist's usual clear and brilliant style.

[To be continued.]

#### THE FRENCH SCHOOL OF ART.

*The Louvre: Salon of 1840.*

[Fifth Notice.]

ANIMAL painting is not, at present, by any means so highly cultivated in France as in England, probably from the same reason as we have suggested for the comparative inferiority of the portrait school: there are not a sufficient number of rich people in the country to give the artist a proper remuneration for his skill, and the requisite amount of

steady, unvarying patronage, always essential for the maintenance of any particular branch, does not exist. Before the Great Revolution, animal painters abounded in France, and, indeed, they were the most skillful at that time in Europe; now we have only two or three of any great merit on the list. One of the principal favourites with the public is M. Jadin, a young man who has dashed into a bold and most effective style, in which he exhibits great powers of drawing, and a certain wholesome perception of colouring that will lead him hereafter to high eminence. He chooses principally dogs and dead game for his subjects, and he has this year produced one of the best pictures in the Louvre. He has represented a pack of stag-hounds resting under some stately trees during their morning's run: in the midst is a fine muscular brown-and-white dog, standing up, looking towards the spectator, and by his side a black-and-tan dog lying down: the other dogs are ably grouped behind. It is a picture not at all unworthy of the Landseer school.—M. Alfred Dedreux is the first painter in France for race-horses, and all subjects in which the muscular powers of that noble animal are to be fully developed. This gentleman has long made the horse the intimate object of his study, and he knows the animal, both as a painter, an anatomist, and a rider, better than any man in France. His powers of delineation are first-rate, and his manner of handling bold and scientific in the extreme. Spending all his spare time at the Jockey Club, in the Bois de Boulogne, or in the Stud House, and having well studied all the excellent English horses which of late years have been brought in such numbers into France, he paints the lineaments of the racer or the hunter with a *verve* and a truth that go to an Englishman's heart, but are hardly yet understood by the common run of the French public. He is very scientific in his shadows,—in the shadows cast by horses on the ground, foreshortening them in a manner that is quite surprising: and he has an exquisite feeling for landscape, which he displays in his backgrounds so charmingly as to make us long to see an original landscape alone of his own production. He has numerous pictures in the *salon* this year: horses taking their gallop, horses in meadows, horses with the groom, &c. &c., all of them excellent productions. We should be glad that some of his canvasses were known in England. Jules Coignet has sent in three capital pictures that may be called game-and-animal pieces, though there is some difficulty in determining that they are not landscapes: one represents an old bitch-fox and cub, among some rocks, basking in the sun; it is full of talent. The others are more elaborate productions, and form a pair, the subjects being merely dead game hanging against the mossy stems of old beech-trees. This artist is the most opaque painter of the French school, but still he avoids much of the crudity of colour which the opaque system almost necessarily causes, and by the correctness of his drawing and vigour of his touch he makes up abundantly for any defects that the tints of his palette sometimes occasion. The two pictures in question, which contain by the way some exquisite little bits of landscape, are very splendid specimens of all the artist's best qualities.

There is a very large and capital picture by Jacobber, the principal flower and fruit painter of the Royal Porcelain Manufactory at Sèvres. It does not possess the same degree of exquisite finish as a Van Huysum, but it is executed

strictly on his plan, and resembles some of his best productions both in composition and colouring: it does the artist infinite credit. In one of the galleries there has been placed another good picture of fruit and flowers, painted with the wax preparation as a vehicle instead of oil,—a circumstance hardly to be discerned from the effect, which is at once bold and good.

In the *tableaux de genre*, on which French artists pique themselves so much, and not unjustly, this year's *salon* is unusually poor: Biard, the French Hogarth of the day, is not here, and the others in this line have all been to sleep. Cottrai, who is a painter of much feeling, and of high finish in nearly all he does, has executed one little *morceau* that is well deserving of notice: he calls it "The Escape," and it represents an aged knight leading a fair lady down the winding staircase of some "donjon keep," in which she has been placed in durance vile. At the foot of the steps lies a guard asleep, and the lady as she passes has put her taper behind a green silk apron to shade the light. The effect of *chiaroscuro* is admirably brought out, and the richness of tone prevalent throughout all parts of the picture make it a really good one. There is an uncommonly droll picture by Leroy, "A Temperance Sermon," in which the congregation are represented by cats. A sharp-looking black mouser is up in a sort of pulpit thundering away against the intemperance of his congregation, while at his feet and behind him is an endless store of mice, fish, and other tit-bits which the feline race are fond of. In the front is a devout white tabby kneeling, or squatting, on a velvet cushion, and grouped around her is a numerous congregation of mewing, mawling animals, in every variety of catlike contrition. The thing is very well done.—There is a broadish bit of humour connected with the life of a Parisian artist, by Benjamin, which makes the Parisians, and even the staid old maids from the British side of the Channel, who are always to be found in such numbers, laugh; it is called "*Le Bourgeois inopportun*." Two artists have just been putting a female model into position on a couch, for a picture that is to represent a Turk in his harem; the other model, the Turk, is warming himself by the fire with the second artist, who is smoking a long pipe. The first artist has just got his palette on his thumb, and is going to sit down to his easel, when a *bourgeois*, whose half-finished portrait is seen on one of the walls, drops in, hoping he don't intrude, to see how the *magnum opus*, the delineation of his own sweet phiz, is getting on. Just as he gets the door open and sees the rather unusual spectacle within the studio, the artist jumps up and tries to slam the door in his face. The leering glance of the *bourgeois*, whose eyes cannot be turned from the fair model, all in confusion, and the enjoyment of the two rogues at the fireplace, are uncommonly well told. This, however, is the only bit of good caricature which we have seen in this year's Exhibition. Last year we had half-a-dozen of the first-rate order.

#### THE DRAMA.

THE Easter week is always a busy week for the stage, if not a distinguished week for the permanent drama. Grand Spectacle is the order of the night, and eyes and ears are addressed by all the pomp of scenery, circumstance of machinery, and afflation of music. At the head of such productions for A.D. 1840 stands, or rather lies, *The Sleeping Beauty in the Wood* of Covent Garden. After *Ion*, very ineffectively done on Monday, this splendid

affair was produced; and for gorgeous trappings, not less picturesque and becoming than rich and correct; for beautiful scenes of landscape, architecture, and fairy; for several pleasing and popular parodies in song; and for dialogue sparkling with smart strokes and entertaining allusions, *The Sleeping Beauty* was altogether very lively, and did credit to the skill and talent of Mr. Planché, as well as to the enlarged resources of this theatre, as compared with the Olympic, where similar pieces were so deservedly successful. Pruning was no doubt required, and has by this time, we dare say, been applied; so that the tedium inseparable from prolonged show, such as was experienced in the second act, has vanished with the first performance. Vestris, as the *Sleeping Beauty*, sang so delightfully to the airs "Nix my Dolly, palls," and "A Long Time Ago," that we were quite sorry to see her put to bed, and thus an end to her singing. Bland, as her royal father, the *King of Noland*, was burlesque majesty to perfection; and Har-ley, his "first grand Every Thing," was like a figure copied from a group of Dresden or Sevres china, and sustained the humours of the piece with laughable and untiring activity. His merry song of "Melancholy marked him for its Own" was delightfully droll. The other leading parts were cleverly filled by Miss Rainforth, Mr. Vining, Mr. Brougham (mortals), and Miss Lee, and a bevy of other says. We must not forget a dance by a very pretty female, Mlle. Bettoni, rather more distinguished by display than elegance. The limb uplifted at the most obtuse angle possible for the human frame to execute, is inconsistent with grace; and the perfection of dancing is that, if the figure were painted at any time, it would not represent an overstrained and ungainly attitude which would offend the eye, but a posture, however disposed, of natural ease and beauty. Miss Bettoni's forte is elevation of leg; but in her cachucha dance she was flexible as the most wanton of Seville's dark daughters.

On Thursday Murphy's comedy of *Know your Own Mind* was revived in the costume of 1777; but there is nothing in the play itself, or in its performance, to recommend it to special favour. The ladies, Vestris, Orger, Lee, Montague, and Tayleure, made the best of it.

At the Haymarket the regular drama continues its unabated attractions; and *Hamlet*, *Richelieu*, &c., followed by *How to Pay the Rent*, &c. &c., well merit the popularity which nightly attends their admirable performance.

*The Adelphi*.—The enterprising Yates, this year, seemed determined on a master-stroke of novelty and attraction. *The Devil in London*, written by Peake and Buckstone, and a grand historical drama, entitled *The Serpent of the Nile, or the Battle of Actium*, by Mr. E. Stirling, were brought forward on the same evening, to the delight of a house crowded from floor to roof. The first is a series of satires upon the follies and vices of the day, whimsically embodied, and represented with no small share of severe truth and comic humour. It has been stated to be of the Tom and Jerry school; but it is only so in regard to the persons and things of which it treats: for it is an *exposé* of moral import, and, if wisely scanned, offers many lessons that ought not to be lost on the rising generation. Yates, humanised into *Hookey Walker*, finds the metropolis much worse than his own capital below, and, by being let into the secrets of pimps, gamblers, beggars, &c., almost becomes qualified for a member of the Society for the Suppression of

Vice. In fact, he has no chance with the sharpers, and swindlers, and decoys of our virtuous metropolis. *Mephistophiles*, another infernal, is more at home as a cheat at cards, races, &c., under the denomination of *Captain Rook*, excellently personated by Mr. Paul Bedford. Of the mortals, *Lord Pigeon*, Mr. Wright; *Fordyce*, Mr. Beverley; *Fearbody*, Mr. Wilkinson; *John*, a footman, Mr. Buckstone; and *Peggy Paragon*, a housemaid, Mrs. Keeley, are the chief; and their various adventures in hells, night cellars, debating societies, Epsom races, &c. &c., are full of fun and clever hits at well-known individuals, as well as at the doings of those who are neither ornaments nor honours to society. The acting is excellent throughout, and the bustle never flags. *Lord Pigeon* is enabled by *Hookey* to render himself invisible, and the scenes which ensue among his friends and dependants are extremely ludicrous. In one, *Peggy Paragon* is delicious; in another, *Captain Rook*, with the gloves and foils, nearly annihilates his unseen companion; and, in a third, the cowardly *Fearbody* is caned and kicked with malignant absurdity. In all, the Peer himself, performed with great effect, and elicited many a hearty laugh. *Inter alia*, an amateur gave capital imitations of leading actors; and the interior of the Opera House was exhibited in a manner not to disgrace that unique lounge of fashion, chastity, and good example. Of the *Battle of Actium*, in which no fewer than eighty pretty Amazons are engaged, we have only to express our wonder that so much can be done on any stage,—and especially on one so limited as this. The scenery, decorations, and action, cannot be imagined without being witnessed.

*The Olympic*.—A *Royal Commission from Paris* was the Easter Monday novelty here, and deservedly successful. It is a French story, and laid in France, where royalist and republican are involved in dangers and escapes. Mr. F. Vining has the principal character, and does it every justice.

*Asley's*.—Damon and Pythias, with equine variations, entertained the holiday folks here. The friends have a hard ride between them and the gallows, but all ends without a rope's-end, as it ought.

*The German Opera*, which was to have opened at the Prince's (late St. James's) Theatre on Monday last, has been deferred, but is announced for next Monday.

Mr. Cloup has opened the Tottenham Street Theatre with a French company, embracing several performers of considerable talent.

*General Theatrical Fund*.—We rejoice to see good accounts of the prosperous advance of this Association. Ninety-three members are enrolled, and upwards of 900l. funded. The public will, we are sure, cheerfully come forward to aid those who have thus begun an establishment to aid themselves, and who have such strong claims on our sympathy and succour.

*Societa Armonica*.—The second concert on Monday was one of great variety and attraction; in which Signora Tosi made a very favourable impression on the audience. A clarionet fantasia introduced Herr Itjen to London, as a performer of much power over the instrument, and merit as a musician. Tamburini and Ernesta Grisi need only be named; nor is more required for the admirable leading of Tolbeque, and the conducting of Mr. Forbes.

*Quartet Concerts, Hanover Square Rooms.*

—On Monday the last but one of these concerts was held; the room was tolerably filled, the music choice, and, as usual, finely executed.

#### VARIETIES.

*The Salmon*.—The experiments on the propagation of this invaluable fish, made by Mr. John Shaw of Drumlanrig, have just been published in a separate shape by Messrs. A. and C. Black of Edinburgh (4to. pp. 20, from the "Transactions" of the Royal Society of that city, with engravings), and they seem (as mentioned in a former *Literary Gossip*) to set the question relating to salmon fry completely at rest. By the most ingenious and carefully conducted observations, Mr. Shaw has proven that the parr, with its dark perpendicular marks, at the age of two years, changes into the clear and bright-scaled *smolt*, which then descends to the sea. Produced from the ova of salmon, the parr at two months old is about an inch and a half in length; at six months, about three inches; and so it grows till the period we have indicated. The transformation is very remarkable; but every one interested ought to read Mr. Shaw's very curious details.

*Copyright in Denmark*.—By a recent law affecting the press in Denmark, it is decreed that copyrights shall become public property within twenty years of an author's death, unless a new edition of his work has been published.

*M. Lefevre's Return to Abyssinia*.—M. Lefevre, a naval officer, who was sent last year to explore that country, arrived at Alexandria on the 15th of March, and left on the 17th on board of the French packet. He has with him four Abyssinians, who are to study at Rome, and afterwards at Paris. One of these emigrants is a doctor of laws, another a military chief, having under his orders 1000 horsemen. The youngest of the four is about twenty-two years of age, speaks French pretty fluently, having learned the language from an English missionary, who not having succeeded in teaching him his own, had been obliged to resort to another in order to make use of him as an interpreter. M. Lefevre's companions, Drs. Petit and Dillon, remained at Adoa, the capital of Tigre, whence they have forwarded to the museum at Paris a pretty rich collection of objects of natural history.—*The Times*.

*The Royal Irish Academy*.—The meetings of January, February, and March, are rather slightly reported in the "Proceedings;" but there are some curious remarks (February 24) on different kinds of ancient querns—they are denominated *bro* in the Celtic, and *breyan* in the Welsh or British, both having the same origin as the French *broyer*—whence our word to *bray*. In Irish, the quern is also called *cloch-crow*; said to mean the stone of sorrow, from the laborious task imposed in the use of it. A report of the Council took a full view of the present condition and prospects of the Academy, and promised the early publication of Mr. Petrie's "Essay on the Round Towers of Ireland." Mr. Petrie has now obtained another prize medal for the best "Essay on the Antiquities of Tara Hill."

*Bristol College*.—The "Bristol Journal" states that it is in contemplation to found a college in that populous city similar to King's College, London.

*Ancient Coins*.—Some sixteen or seventeen very ancient gold coins (said to be of the time of Ethelred) have been dug up in Eastcheap, near Pudding Lane, on the premises of Mr. Taylor, the city plumber. The men, it is to be regretted, sold them to a silversmith, and

he to a Jew; but hopes are entertained that they may have been preserved from the melting pot.

**Tanning.**—An improvement, it is stated, has been made in the process of tanning, by an individual near Bristol. The hides are subjected to it by being disposed on rollers, which accelerates the work, and finishes it in a more perfect manner than heretofore by prolonged immersion in the pits.

**Volcano.**—A submarine volcano has lately been observed near the site where an island was thrown up in 1831, between Sicily and Pantellaria.

**Celtic Antiquities.**—At Bougon, in the two Sèvres, a very ancient Celtic tumulus has been explored. It consists of a gallery and cavern, formed of nine erect stones, and covered by a slab 23 feet 3 inches long. The interior is filled with bones, and the heads of the skeletons touch the walls of the cavern; and by their sides are vases of baked earth containing provisions, among which are nuts and acorns in perfection. Two hatchets, and two knives of flint, and other sharp instruments; two necklaces of shells, and baked earth, several boar-tusks, the bones of a dog, and a plate with fragments of a rude design, are among these remains, which are probably 2000 years old. The tumulus is 800 paces in circumference, and about twenty feet high. The smallest vase is said to be a Druid's cup.

**Lord North** (on his retirement from the ministry) has had two places, which he held only during pleasure, settled on him for life; so that you may judge he is not very much chagrined at being displaced. He attends regularly in the House of Commons as a private member of parliament. In private company the other day he said, that the opposition, who had always complained of his publishing lying gazettes, were no sooner in office than they set off with a gazette more full of lies than any of his had been; for it contained a string of paragraphs, each beginning "His Majesty has been pleased to appoint," &c., when it is certain that the king was not pleased at any one of those appointments. It would amuse you to see how most of the pensioned newspapers have changed their style; they now pay assiduous court, with compliments and panegyrics, to the men whom, a few weeks ago, they constantly persecuted with libels and lampoons.—*Memoirs of Romilly.*

**The Life and Times of Whittington, thirteenth Lord Mayor of London.** Part I. (pp. 32, Cunningham) begins a popular biography in a clever and graphic manner, which promises well for the whole. Two quaint but characteristic woodcuts adorn it, and Dick and his famous cat give *éclat* to the cover.

**Dr. Laut Carpenter.**—This well-known and prolific author has been unfortunately drowned whilst on a voyage for his health, between Naples and Leghorn. He went upon the deck of the vessel during a tempestuous night, and is supposed to have been pitched over by the violence of her motion.

**Lieutenant Drummond**, whose scientific experiments on light, and other philosophical pursuits, are familiar to the public, died, after a few days' illness, last week at Dublin, where he held the responsible office of Secretary to the Lord Lieutenant.

**Mr. Pitt**, the sculptor, is also on the list of our deaths within these few days. In a state of mental depression, this unfortunate gentleman put a period to his existence by taking laudanum.

#### Epitaph on an Infant.

"Ere sin could blight, or sorrow fade,  
Death came with friendly care,  
The opening bud to heaven conveyed,  
And bade it blossom there."—COLERIDGE.

Non vlti flatu perit, non imbre doloris,  
Incipiens trepidè flos sperie sinum;  
Sed cœli cupiere suum, et, sic luce perennem,  
Transtulit in cœlos mortis amica manus.  
Cork, April 13th, 1840. X. Y. Z.

#### LITERARY NOVELTIES.

Narrative of Adventures during an Expedition to Siberia and the Polar Sea. By Admiral von Wrangell. Edited by Major Sabine, F.R.S., and illustrated with a map engraved from the original survey, by J. and C. Walker, is announced as being nearly ready for publication.

Except the 21st and following day, generally clear; a shower of rain on the afternoon of the 16th and night of the 22d.

Rain fallen, .05 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

\* \* \* It ought to be generally known, and in the country especially, as it is now pretty well known in town, that letters not prepaid are refused by nearly all, if not all, the nobility and gentry in London.

Several articles under continuation are further deferred to make room for as large a portion as we can of the many novelties which have followed the repose of Lent.

Mr. Spencer's Letter from Liverpool reached us too late.

#### ADVERTISEMENTS.

Connected with Literature and the Arts.

#### BRITISH INSTITUTION,

35, PAUL MALL.

The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

#### THE SIXTH ANNUAL EXHIBITION

of the NEW SOCIETY of PAINTERS in WATER-COLOURS is now open, at their Gallery, 53 Paul Mall (adjoining the British Institution), from Nine o'Clock till Dark.

Admission, 1s. Catalogue, 6d.  
JAMES FAHEY, Hon. Secretary.

#### UNIVERSITY OF LONDON.—FACULTY OF ARTS.

The Annual Examination for the Degree of

Bachelor of Arts is appointed to commence on Monday, the 25th of May next. The Certificates required must be transmitted to the Registrar Fourteen Days before the Examination begins.

By Order of the Senate,  
R. W. ROTHMAN, Registrar.

Somerset House, April 28, 1840.

#### KING'S COLLEGE, LONDON.—Senior

Department.—The Classes in Theology, the Classics, Mathematics, English Literature, and History, under the Superintendence of the Principal, and Professors the Rev. T. G. Hall, R. W. Browne, and T. Dale, will be Re-opened on Tuesday, the 28th instant.

The Classes for Private Instruction in Hebrew, the Oriental, and other Foreign Languages, will also be resumed.

Civil Engineers, &c.—This Department, under the Superintendence of Professors Hall, Moseley, Daniell, Wheatstone, and Ansted, and Mr. Bradley, Mr. E. Cowper, Mr. J. Tennant, and Mr. Castle, will be also Re-opened on Tuesday, the 28th instant.

Junior Department.—The Classes will recommence on Tuesday, the 28th instant.

April 16, 1840.

J. LONSDALE, Principal.

#### SIX LECTURES ON ENGLISH LITERATURE,

from the Earliest Period to the End of the Eighteenth Century, will be delivered at the Marylebone Literary Institution, 17 Edwards Street, Portman Square, by T. B. BROWN, Esq. (of Moulton), Author of "Thoughts of the Times," on Thursday, May 7, May 14, May 21, May 28, June 4, and June 11, at 3 o'clock precisely.

Syllabus and Tickets to be had of Mr. Bain, Bookseller, 1 Haymarket; of Messrs. Hatchard, Piccadilly; and at the Lecture-Room. Tickets for the Course, One Guinea; single Ticket, 5s.

#### MR. CARLYLE'S LECTURES on

HEROES, HERO-WORSHIP, and the HEROIC, in HUMAN HISTORY. Six Lectures, to be delivered at 17 Edwards Street, Portman Square, at 3 o'clock P.M., on Tuesday, Wednesday, Thursday, Friday, and Saturday, next, by Mr. Carlyle. The Hero as Divinity; Lecture II. as Prophet; Lecture III. as Poet; Lecture IV. as Priest; Lecture V. as Man of Letters; Lecture VI. as King. Subscription to the Course, One Guinea. Syllabus and Tickets to be had of Mr. Fraser, Publisher, 215 Regent Street; and at the Lecture-Room.

#### THE SANATORIUM.—A self-supporting

Institution, for the Lodging, Nursing, and Cure of Sick Persons of the Middle Classes, of both Sexes. Established 6th March, 1840. James Pattison, Esq. M.P. in the chair.

Treasurer, Lewis Lloyd, Esq.

Doctors, Messrs. Jones, Lord, and Co. Lombard.

The Provisional Committee request the attention of the Middle Classes of Society, eminently distinguished for their benevolent exertions in alleviating the sufferings of others, to the opportunity now afforded of securing for themselves, when attacked by illness, the means of obtaining, at a moderate expense, the comfort and advantage of a spacious and well-ventilated sick-chamber, skilful and faithful Nursing, judicious Regimen, and sound Medical Advice.

Subscriptions and Communications received by Dr. Mitchell, 30 New Bond Street; and Mr. Geo. May, 165 Aldersgate Street.

GEORGE STACY, Hon. Secretary.

#### BROOKMAN and LANGDON'S ORI-

GINAL DRAWING PENCILS, 6d. each.—The Public are respectfully informed, that these superior Articles, manufactured on the principles which have acquired for them such extensive patronage, particularly during the last FIFTY YEARS, may be procured of all respectable Stationers in London and the country, at the above-mentioned price. The division into different degrees of hardness adapted to the various purposes to which Pencils are applied, and appropriately distinguished by letters marked at the end, viz.—H (hard), HH (engineering, very hard), HHH (ditto, extremely hard) HB (hard and black), B (black for shade), BB (very black for ditto), F (fine drawing, middling degree), an invention which proceeded, in the first instance, from their house, though now universally adopted, is still continued by them. B and J. also make Drawing Pencils, distributed (like their best Pencils) into seven degrees of hardness: these Pencils, which bear the words "SECOND QUALITY" impressed on each, are sold at half the price of the former; they are confidently recommended as very superior articles, being entirely free from those irritating irritations, by the frequent occurrence of which Brookman and Langdon, in common with all manufacturers of celebrated articles, have suffered considerably in reputation, purchasers are advised to make choice of the most respectable shop, and to be on their guard against articles offered as best Drawing Pencils at a reduced price. Pencils may be ordered, at any price.—Manufactory, 38 Great Russell Street, Bloomsbury, London.—N.B. All communications by post to be prepaid.

On Monday, in 1 vol. royal folio, half-bound in morocco, with patent caoutchouc binding, price Four Guineas.

**MEMOIRS OF THE PRINCESS DASCHKAW,**  
 Lady of Honour to Catherine II.  
 Written by Herself.

To which are subjoined, numerous Letters of the Empress Catherine, and other Distinguished Personages.  
 "The memoirs of a woman who at eighteen headed a revolution, was the cherished companion of Catherine, for twenty years the president of the Academy of Arts and Sciences, who travelled over the principal countries of Europe, and corresponded with its most eminent scholars and statesmen—with Voltaire, Diderot, Robertson, Prince Kaunitz, and Bishop Talleyrand; who exhibited talents for governing and improving mankind equal to those of her imperial mistress; who was banished by Paul and recalled by Alexander; who made the woman-hating Frederick of Prussia stand bareheaded in the presence of his troops, compelling her for a quarter of an hour; and drew the 'invalid of Hungary' to the supper-table, when his doors were closed against the most illustrious personages and brilliant wits of Europe; the memoirs of a being so versatile and various, and who passed through so many vicissitudes, cannot but be eminently interesting."—*Conservative Journal*.  
 Henry Colburn, Publisher, 13 Great Marlborough Street.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammersmith, and GEORGE BARCLAY, of Number 2 Finsbury Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 22 Castle Street, near the square, in the said County; and published by WILLIAM ARMITAGE SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, April 25th, 1840.

### REVIEWS OF NEW BOOKS.

*Rivalry.* By Henry Milton. 3 vols. 12mo. London, 1840. Ollivier.

THIS is an amusing novel in the caricature style. A bachelor goes to a country village, where, though not rich, he is yet such an object of attraction that an old maid and a widow set their caps at him in the most determined fashion. The spinster attacks him through sentimental poetry, and the widow through good dinners; so that our friend has both his head and stomach stuffed by those who wish to carry off the prize. The other best-drawn characters are a weak wealthy lord, Forrester, the victim of a villain, and that villain, Tarleton, who, with fine intellect, has been betrayed into the downward path, and become the wretch we see. There is also an attached, blunt, old servant-woman, who is perhaps the most original figure in the piece; but the heroine, Clara, ought not to be passed without our saying, that she is superior to most personages of that class to whom we are introduced in the fictions of the day.

The style is easy and agreeable; and some of the scenes extremely well drawn. We select a wrestling-match as an example:—

"There now only remained the final trial between the two conquerors of the day, Lionel and Wheatley. A buzz of applause ran round the ring, as they approached each other, and good-humouredly shook hands. Two finer-looking young men, and more equally matched, perhaps never stood on the green turf in friendly opposition. Exactly the same age, the same height, and if there was any difference between them, it was that Wheatley was somewhat the heavier man; but in both, the symmetry of the limbs was perfect, and the muscles finely and equally developed; and they were both in the prime of health and strength. 'Do your best, Ned Wheatley,' said Lionel; 'I have had some practice since you and I stood up together last. You must be in earnest with me to-day.' 'I know I must, master Lionel,' answered Wheatley, 'there are so many pretty girls looking on.' The young men closed; and each, with perfect confidence, allowed his opponent leisurely to fasten his strong grasp on his jacket exactly as he pleased, and to alter it again and again. A mutual nod declared that each was satisfied, and the struggle began. Nothing can differ more than a wrestling-match, as seen by learned and unlearned eyes. The latter only perceive that two strong men are trying to pull each other to the ground; and when at length the one goes down, they are totally unable to tell why he then falls, or why he did not fall long before. But to the learned, every movement has its import and its interest. The moves in a game of chess, played by two skillful adversaries, have not more exact and defined purposes than every movement of the scientific wrestler. The same foresight is necessary, the same quickness to distinguish between a feigned and real attack, the same prompt decision, the same command of temper. In both games, each movement of the one player must be met and guarded against by the other, or yielded to for the purpose of

making the adversary expose himself still further. In both, there is no finer play than by intentional mistakes to throw your adversary off his guard, or to confuse him by changing, at the exact moment, a feigned, into a real attack. The two powerful young men, who now stood locked together, were perfect masters of the art. As children, as boys, and until the last three years, they had perpetually contended together. Each knew and each respected his opponent's skill, and yet each felt full confidence in himself. No match could well be more equal; Edward Wheatley might be somewhat the stronger man, but Walsingham was an accomplished fencer; and the rapidity of movement which that beautiful art gives more than counterbalanced this advantage, and indeed the fate of the day's contest turned upon it. Cautiously and by degrees they bent themselves to the struggle, each with keen and quick glances reading his adversary's intention in his eye. By both, feints were made, and by both disregarded, treacherous openings were given, and rejected with a smile, each movement of the one was met by a corresponding movement of the other, and the scale of victory hung with a level beam. They paused to take breath, and then the silent anxiety of the crowd was changed at once into shouts of 'Bravo! bravo! pretty play! pretty play! well done, soldier! well done, my lord!' The contest was resumed with equal caution and with equal strength, but its duration was much shorter. Wheatley made a skilful, but too bold attempt to close upon his opponent, it was foiled by Lionel; who, quick as thought, seized the advantage, and advancing his left side to his adversary, caught him on his hip. For an instant, Wheatley's feet appeared to cling to the ground; and then all power of resistance was lost, and he was whirled round like a wheel; his feet describing nearly an entire circle, and his back falling gently and fairly on the turf. The soldier in an instant sprang up good-humouredly; but, with a somewhat quick step, withdrew himself from observation, while deafening shouts of applause resounded on every side; then ceased, and then were again renewed."

Our next specimen is a good hint to album-writers. The hero writes in the old maid's book with malice prepense, and not the less so, as he also lends her Darwin's "Botany:—

"Horace.

When, Lydia, I was dear to thee;  
When thy soft waist, and panting breast,  
Were clasped by none, by none but me,  
I lived than Persia's king more blest.

Lydia.

When you invoked no other love,  
When Lydia was no second name,  
For much was Lydia then approved  
More bright than Illia's was my fame.

Horace.

The Cretan Chloe holds me now,  
Skilled in each soft seductive art.  
To death a willing slave I'd bow,  
To screen my Chloe from the dart.

Lydia.

In mutual chains the Cyprian Boy  
Has bound young Calais and me.  
A thousand deaths I'd meet with joy,  
From death my Calais to free.

Horace.

What, should our former loves return,  
And bind our jarring hearts anew?  
For Chloe should I cease to burn,  
And spread again my arms to you?

Lydia.

Though he be fairer than the morn,  
Thou light as cork, wild as the sea,  
With thee to live, all else I'd scorn,  
And willingly I'd die for thee.

The fair spinster read the lines again and again, and the more she dwelt upon them, the more she doubted whether their real import was not equivalent to a declaration of love. On this point she determined to consult Mrs. Wilkinson. But now a new source of painful terror bewildered her. Did not the second and third lines border on the indelicate? Were they such lines as should have a place in so pure an album as hers? Were they such lines as a precisely and perfectly virtuous man should send to the woman whom he intended to call his own? "Panting!" Oh dear! oh dear!" cried Mrs. Chamberlayne, unable to give utterance to the still more objectionable word which followed; "and 'clasped!'—What am I to do? I would not have Mrs. Middleton see those two lines in my album for fifty pounds. Oh, I would give the world to know if Lydia was a moral character!" Miss Chamberlayne referred to a classical dictionary, which had formed a part of her school library, but with no success. She knew that she had met with the name in some book, but could not recollect where. It was either the Bible, or Rapin's "History of England," and she was certain that Lydia had been in business. As a bright thought, she again resorted to her "Classical Dictionary," and turned to the Life of Horace. Here the worst fears which the free expression of the fatal third line had suggested were realised, and the enormity of Hardings's conduct revealed in all its black extent. What was she to do? Tear out the page, and give it to the flames? That was impossible. The rest of the verses were so very, very pretty; and they were all so beautifully written! If necessity be often the mother of invention, so is modesty sometimes. Miss Chamberlayne had heard of indecorous pictures being covered with curtains, and she at once determined to remodel the plan, and adapt it to her own painful situation. A slip of pink riband was accordingly placed neatly over the two obnoxious lines, but fixed only at the extreme edges of the page, so as to enable them to be read by those who dared withdraw the veil; and on a bit of paper, skilfully gummed upon the riband, she inscribed, in her most distinct writing, the two admonitory words,

"Improper Below."

The suicide of Tarleton, under sentence of death for forgery, will shew the author's powers in another line; and with it we conclude our extracts:—

"The hours wore on. The two men who had been stationed in the cell throughout the day were relieved at night by two of their companions. These, as their predecessors had done, proffered the solace of their conversation and gaol-like sympathy to their charge, and like them were repelled. It was his wish, he

told them, to be left undisturbed to his own reflections. 'Well, master, all's one to us: read away, if it will do you more good than a little chat—I should think not; but you know best.' They placed themselves one on each side of the fire, and quietly made their arrangements for a night of watching, diversified by no other amusement than frequent libations of porter; for at the urgent request of Tarleton, to whom the reek of tobacco was a deadly offence, they had been interdicted from smoking; and except a few words of broken conversation, they passed the night in silence; indulging one at a time, as if by an established system, in a short doze, which appeared in no degree to deaden their acute perception of every thing that took place around them. Tarleton was seated at a table in front of the fire, on which were several books; and the dull light of a single candle only faintly illumined the room. His person had been minutely searched after the parting interview with Emma Woodford and his son; and he knew that the scrutiny would not be again repeated. The time which he selected for the removal of the minute poniard from its place of concealment was when his guardians were changed. There was then a great number of eyes around him; but he judged rightly that the bustle of the moment would be most favourable to his purpose; and unperceived the deadly instrument was secreted in his vest. Midnight was long past. The snatches of conversation between the two men became shorter, and their intervals of dog-sleep more lengthened; but they never amounted to a loss of consciousness; nor could the prisoner make the slightest movement without their perceiving it. Tarleton continued leaning over his volume, and appeared buried in its contents. He placed his right hand within his vest, but without altering his attitude, or casting a glance at his guardians. Both noticed the action—looked keenly at him for a moment, but nothing in his look or manner excited suspicion; and they resumed their semi-dormant state. Slowly and cautiously seizing the steel by its flattened end, he placed the point against his heart; and, with a steady hand, buried it once—twice—thrice—in his side. So little pain attended the wounds, that had he not felt each time a convulsive sensation as if a strong cord had been drawn tightly round his chest, he would have doubted whether the instrument had reached any vital part. A fourth time he drove it into his flesh, and with such force, that the highly tempered and brittle steel, striking against the rib, broke in the wound. The pain at the moment was so intense that he started; and both the men were at once on the alert; but he raised his left hand to his forehead, and, muttering aloud, 'My brain aches to distraction,' leant his head over the table. At length he felt the warm blood trickling down his side; he resumed the volume he had been studying, and strove to fix his mind on its contents; but in vain. Every faculty was strained to detect the first sensation of diminished strength; he feared that the blood had ceased to flow, or at least flowed so slowly, that no vital part could have been touched. The agonising fear now intruded itself, that the loss of blood, though not sufficient to destroy his life, would so enfeeble him, that when the ignominious hour came, he should disgrace himself by unmanly weakness. The idea filled him with horror, and dreadful was the period of suspense. The two men had been indulging in a longer conversation than usual: they now were silent, and a faint sound caught Tarleton's ear. Again and again it was repeated in

quick succession. It was his blood dropping on to the stone floor. Never in the happiest moment of his life had he felt joy so intense. He knew that he had freed himself from the degrading exhibition which his mind, morbidly sensitive, had dreaded a thousand times worse than death; and had dreaded more and more as each succeeding hour passed on. A new fear alarmed him; the sound was so distinct, so loud, for so it seemed to his excited sense, that the keepers must hear it: they would detect him, and even now frustrate his design. He looked from the one to the other; they appeared half asleep; he dared not by speaking attempt to drown the noise; for to arouse them would increase the danger. Before long he felt a sinking at the heart, and a calm, heavy sleepiness gained upon him: he hailed it with delight. The blood which flowed from his breast had found some other channel, and reached the floor without noise. He knew that it did reach it, for by degrees the floor around his chair became a pool of blood, which slowly extended itself towards the hearth. His strength began to fail: his eye dwelt once again on the page which had been his solace and delight, but its sense no longer reached him, and he sank back in his chair. The movement aroused one of the keepers. 'Well, master,' he said, 'how fares it by this time?' Tarleton returned a few words of answer, and the man, folding his arm, was again composing himself to sleep, when his eye glanced on the floor; he started up, and shouted in a voice of rage and alarm, 'Jim! Jim!—I say! hell and the devil! we are done! the man's killed himself!' They both rushed towards Tarleton, and, with rude violence uncovering his breast, perceived the wounds, from one of which the blood was slowly welling at intervals. He attempted no resistance, but said in a sarcastic tone, 'Your zeal is too late, sirs, I have escaped you.'

We have rather overstepped our rule of never meddling with plots; but we have been so much amused with that of *Rivalry*, that we could not resist the temptation of letting our readers a little behind the scenes, with which we would recommend them to become better acquainted.

*The Bachelor's Walk in a Fog.* Written by Myself, Peter Styles, Gent. 8vo. pp. 58. With Fifteen Lithographic Illustrations. London, 1840. Sherwood and Co.

THIS is a merry trifle, and would puzzle the gravest critic to comment upon it: the very preface "out-Herods Herod," and we cannot for a moment speak of it seriously. What can we look for in a book that has for its mottoes

"All round my hat."—MILTON.

"Flayre uppe."—CHAUCER.

but a "flare-up" in very deed? The work is not without merit, though the puns and the illustrations have a very "all-round-my-hat-tish" look about them. It purports to give the "misfortunes dire" that befell a bachelor on a foggy day in London, and the poor wight is sorely beset. After having come in contact with a sweep, and been begrimed with "innocent blackness," our adventurer meets with another disaster.

"Oh! had you stood, as I then stood,  
Soak'd through from head to heel,  
If you had never felt before,  
It would have made you feel."

My hat was crush'd, my coat half white,  
My face 'a new compost';  
Oh! I was pale enough to play  
Young Hamlet's father's ghost.

Like one half-mad away I ran,  
Whither I scarce can tell;  
But if I ran not up Pall Mall,  
I ran along 'pell-mell.'

Why should I pause here to narrate  
What folks were overthrown?  
They might be rogues or honest men,  
But that will ne'er be known.

Till, brought up by an image boy,  
Whose board went spinning round;  
And all his casts, so neatly made,  
Were cast upon the ground.

Kings, queens—the warlike Joan of Arc—  
All drop'd without a groan;  
Napoleon fell—a second time  
By Wellington o'erthrown.

Milton and Shakspeare, side by side,  
Resign'd their mighty powers;  
I tumbled down all 'Paradise,'  
And shook 'the cloud-capt towers.'

'Oh what a falling off was there,'  
Of statesmen, bards, and sages;  
Were I to tell you half their names,  
'T would fill up all my pages.

And there I stood—half white, half black—  
A pitiable sight;  
I seem'd a Blackamoor kick'd out,  
When only scrubb'd half white.

An organ-grinder, who stood by,  
And gazed in wild amaze,  
Struck up, to clear away the fog,  
'The light of other days.'

I ran along—I durst not stay—  
I never look'd behind;  
I knew that I had lost my purse,  
And pity is but wind.

Some cried, 'Flare up!' but on I ran;  
I durst not stay to wrangle;  
One said, 'How are you off for soap?'  
And, 'Have you sold your mangle?'"

Another extract, the "Invocation to the Muses," and we must bid farewell to trifling, for the work has no pretension to a higher vein:—

"Invocation to the Old Nine Muses.

Indwellers of the purple-footed clouds!  
Ye azure-lidded, sky-clad, starry singers;  
Come, cast aside your silvery-floating shrouds,  
'Tis Peter Styles that calls you—ye verse-ringers!  
'They come not! well, I'll try another strain,  
And tempt them if I can—here goes again.'  
Ale sacred Nine! perhaps there may be more;  
If so, I've brew'd sufficient for ye all.  
Ale sacred Nine, ten, twelve, thirteen, a score!  
Ye must be deaf; oh! how one's forced to bawl.  
Beer sacred Nine! if ale's too strong—before  
I'll beg and pray thus loud to you, I'll scrawl  
Without your help.—He who these lines peruses,  
Know, that I do disband the whole Nine Muses,  
Because they won't come to me when I chus ES."

*The Countess of Salisbury.* By Alexander Dumas. And the *Maid of Corinth*. 3 vols. 12mo. Bentley.

THE historical romance which Scott shewed the French authors could be planted with singular effect on the French soil, has had no cultivator more able than Alexander Dumas, and his *Countess of Salisbury* is altogether a very favourable example of this species of composition. It occupies the first and second of these volumes and is less the history of the Countess of Salisbury than of the wars of our Edward the Third in France, which are described with great spirit. The opening chapter, the Feast of the Heron, is vividly brought before the reader; and the variety of oaths then registered, and afterwards so faithfully kept, are inscribed in expressive language. Edward's journey as his own ambassador to Flanders is very interesting, and gives curious pictures of the age and some of its prominent characters. From so connected a narrative it is not possible to separate an extract which can afford any idea of the whole; so we must content ourselves with saying that it is full of variety and interest, and extremely well translated. The third volume is devoted to Roman history and the loves of the Emperor Nero and a beautiful Greek girl; the style is totally different, the language more refined and softened. As a specimen, the departure of Acte from Corinth is thus described:—

"My beloved Acte, wilt thou not profit by the rising sun to come and breathe the pure morning air?" There was a tone in his voice, however inwardly calm and gentle, which thrilled, and if we may so express it, vibrated with a metallic sound, which Acte now remarked for the first time; so that an instinctive sentiment, nearly allied to fear, sunk so deeply into her heart, that, instead of replying, she rose to obey. Her strength did not second her will, and she would have fallen, if Lucius had not sprung forward and supported her; she then felt herself borne in her lover's arms, with the same facility as an eagle would have carried off a dove, and trembling, without asking herself the cause of her terror, she allowed herself to be taken away silently, and with her eyes closed, as though the journey was to end in a precipice. She felt herself revived when she got to the deck of the vessel; the breeze was so pure and so perfumed; besides, when no longer in Lucius's arms, she gained sufficient courage to open her eyes. She found herself lying on the taffrail of the poop, in a hammock of golden meshes, fastened on one side to the mast, and on the other to a little carved pillar, which appeared designed for a support. Lucius was standing near her leaning against the mast. During the night, the vessel which had been favoured by the wind, had quitted the gulf of Corinth, and doubling Cape Elis, had passed between Zacynthus and Cephalonia; the sun appeared to be rising between these two islands, and his first rays beamed on the chain of mountains which separates them in two parts, while the western side was still plunged in shade. Acte was ignorant where she was, and turning to Lucius, inquired, "If that was still Greece?" "Yes," said Lucius, "and this perfume which is wafted to us as a last adieu, is from the roses of Samos, and the orange-trees of Zacynthus; there is no winter for these twin sisters, which expand to the sun like a basket of flowers. My beautiful Acte, shall I build a palace for thee in each of these islands?" "Lucius," said Acte, "thou frightenest me at times, by making me promises which a god alone could perform. Who art thou, and what dost thou conceal from me? art thou Thundering Jupiter? and dost thou fear, in appearing to me in all thy splendour, thy thunderbolt would consume me as it did Semele of old?" "Thou art mistaken," said Lucius, smiling; "I am only a poor singer to whom an uncle left all his fortune, on condition that I should bear his name; my only power is in my love, Acte, but I feel that with this support I could undertake the twelve labours of Hercules." "Thou lovest me, then?" the damsel inquired. "Yes, my soul!" Lucius replied. And the Roman uttered these words in so true and energetic a tone, that his mistress raised her hands towards heaven, as if in thankfulness for her bliss; for at that moment she had forgotten every thing, and regret and remorse vanished from her mind, like her country, which disappeared in the horizon."

Altogether, we cordially recommend these volumes as very pleasant summer-reading companions; upon which the few hours bestowed will be well and agreeably spent.

#### MEMOIRS OF SIR SAMUEL ROMILLY. [Second notice.]

IN 1784, Sir S. first met the celebrated Count de Mirabeau; and in 1789 we find him at Paris, in the heart of the movements then hastening France on to her fatal crisis.

"I had (he tells us) a letter from Lord Lansdowne to Necker; I was acquainted with the

Bishop of Chartres, a deputy to the States; and by these various means I saw a great number of the persons who were most distinguished as speakers in the Assembly. I was very frequent in my attendance there, and often heard Monnier, Barnave, Lally-Tolendal, Thourer, Maury, Cassals, and D'Espremenil, who were some of the speakers at that time most looked up to by the different parties. I heard Robespierre; but he was then so obscure, and spoke with so little talent or success, that I have not the least recollection of his person. I met the Abbé Sieyès several times at the Bishop of Chartres; he was the bishop's *aumonier*, and a person of whose talents he entertained the highest opinion. Sieyès was of a morose disposition, said little in company, and appeared to have a full sense of his own superiority, and great contempt for the opinions of others. He was, however, when I saw him, greatly out of humour with the Assembly, and with every body who had concurred in its decree for the abolition of tithes, and seemed to augur very ill of the revolution. While I was at Versailles, he published his defence of tithes, with this motto prefixed to it,—"Ils veulent étre libres, et ils ne savent pas étre justes." At the Bishop of Chartres, too, I sometimes met with Pétion, a man who appeared to me to have neither talents nor vices which could enable him to have so great and so unfortunate an influence on public affairs as he afterwards appeared to have. What struck me as most remarkable in the dispositions of the people that I saw, was the great desire that every body had to act a great part, and the jealousy which in consequence of this was entertained of those who were really eminent. It seemed as if all persons, from the highest to the lowest, whether deputies themselves, declaimers in the Palais Royal, orators in the coffee-houses, spectators in the gallery, or the populace about the door, looked upon themselves individually as of great consequence in the revolution. The man who kept the hôtel at which I lodged at Paris, a certain M. Villars, was a private in the National Guard. Upon my returning home on the day of the benediction of their colours at Notre Dame, and telling him that I had been present at the ceremony, he said, "You saw me, sir?" I was obliged to say that I really had not. He said, "Is that possible, sir? You did not see me! Why I was in one of the first ranks—all Paris saw me." I have often since thought of my host's childish vanity. What he spoke was felt by thousands. The most important transactions were as nothing, but as they had relation to the figure which each little, self-conceited hero acted in them. To attract the attention of all Paris, or of all France, was often the motive of conduct in matters which were attended with most momentous consequences. The confidence which they felt in themselves, and their unwillingness to be informed by persons capable of giving them information, was not a little remarkable. I was dining one day at M. Necker's, at Versailles, at a great dinner, at which many of the deputies were present; amongst others, M. Mallouet, a man of considerable eminence. It was a day in which great tumult had prevailed in the National Assembly, and the Bishop of Langres, who was then the president, had rung his bell to command silence till he had broken it; but all had been in vain. The conversation turned upon this. Mallouet observed, that in the English House of Commons the greatest order prevailed, and that this was accomplished by dint of the great authority vested in the Speaker, who had power, if any

member behaved disorderly, to impose silence on him by way of punishment for two months, or any other limited period of time. M. Necker turned round to me as the only Englishman present, and asked me if this was so. M. Mallouet had been so positive and bold in his assertion, that I thought the most polite way in which I could contradict him was to say that I had never heard of it. But this only served to give that gentleman an opportunity of shewing his great superiority over me. I might not, he said, have heard of it, but of the fact there was not the least doubt. Mirabeau was acting a great part during the whole time that I was at Versailles; and it was not surprising that he was a little intoxicated by the applause and admiration which he received. He was certainly a very extraordinary man, with great defects undoubtedly, but with many very good qualities; possessed of great talents himself, and having a singular faculty of bringing forward and availing himself of the talents of others. He was a great plagiarist; but it was from avarice, not poverty, that he appropriated to himself the views and the eloquence of others. Whatever he found forcible or beautiful, he considered as a kind of common property which he might avail himself of, and which he ought to make the most of to promote the objects he had in view; and, notwithstanding all that has been said against him, I am well convinced that both in his writings and in his speeches he had what he sincerely conceived to be the good of mankind for his object. He was vain, and he was inordinately ambitious; but his ambition was to act a noble part, and to establish the liberty of his country on the most solid foundations. He was very unjustly accused of having varied in his politics, and of having gone over to the court. From the beginning, and when he was the idol of the people, he always had it in view to establish a limited monarchy in France upon the model of the British constitution. That at the time when the democratical leaders in France had far other projects in contemplation, he was in secret correspondence with the court, and that he received money from the king I think highly probable; and the gross immorality of such conduct I am not disposed to justify, or even to palliate. But those who believe that he suffered himself to be bribed to do what his own heart and judgment condemned, and that, unbribed, he would have acted a very different part, do him, in my opinion, and I had frequent opportunities of hearing his sentiments at the different periods when I was intimately acquainted with him, very great injustice. I have already spoken of his relaxed morality and of his vanity. In matters of indifference, ay, and sometimes in matters of importance too, the placing himself in an advantageous point of view to those whose applause or admiration he courted, far outweighed the interests of truth. Among many instances of this kind, which came within my own observation, there was one so remarkable that I cannot forbear to mention it. In one of the early numbers of the 'Courrier de Provence,' in which Mirabeau wrote himself, he represents Monnier as saying in the National Assembly that it was corruption which had destroyed England, and himself, as very happily turning that extravagant hyperbole into ridicule, by exclaiming upon the important news so unexpectedly communicated to the Assembly of the destruction of England, and asking when and in what form that remarkable event had been brought about? The truth, however, is, that of all this not a

single word was uttered in the Assembly. Neither Mounier nor any other person talked of the destruction of England; neither Mirabeau nor any other person made any such reply as he assumes to himself. The whole origin of this fiction was, that while Mirabeau was writing his 'Courrier de Provence,' exactly what he has stated passed in a private conversation, at which he was present. Brissot de Warville used the words which he has ascribed to Mounier, and Dumont those which he has claimed for himself. He thought the dialogue too good and too happily expressed to be lost; he made himself the hero of it, and placed the scene in the National Assembly; and this, though he well knew that Brissot, Dumont, Mounier, and all the members of the Assembly, could give evidence of the falsehood of his statement, and which, indeed, Mounier took occasion formally to do in the justification of his own conduct, which he not long afterwards published. Of all Mirabeau's extraordinary talents, his faculty of availing himself of the knowledge and abilities of others was perhaps the most extraordinary. As an author, he has published the works of others, and, with their permission, under his own name, and as if they were his own. The eight octavo volumes which he published on the Prussian Monarchy were entirely, as to every thing but the style, the work of M. de Mauvillon. His tracts upon finance were Clavière's; the substance of his work on the Cincinnati was to be found in an American pamphlet; his pamphlet on the opening of the Scheldt was Benjamin Vaughan's; and I once saw him very eager to undertake a great work on geography, of which he was totally ignorant, in the expectation that M. de Rochette, a geographer of great merit, and with whom he had contracted great intimacy, would supply him with all the materials for it. As an orator, he on many occasions delivered in the National Assembly speeches as his own, which had been composed for him by others; and so much confidence had he in the persons who thus contributed to establish his reputation, that he has sometimes, to my knowledge, read at the tribune of the Assembly speeches which he had not even cast his eyes upon before, and which were as new to himself as to his admiring audience."

To this interesting sketch we add another of Diderot, which seems worthy to pair with it:—

"You ask what I think of Diderot. I did not suppose you would have thought that question necessary, when you had read the account of my visit. With respect to the atheists of Paris, among honest men there can hardly be two opinions. A man must be grossly stupid who can entertain such pernicious notions on subjects of the highest importance without strictly examining them; and much is he to be pitied if, after examination, he still retains them; but if, without examination of them, and uncertain of their truth, though certain of their fatal consequences, he industriously propagates them among mankind, one loses all compassion for him in abhorrence of his guilt. He is like a man infected with some deadly contagious disease, for whom one's heart bleeds while he submits in secrecy to his fate; but when one sees him running in the midst of a multitude, with the infernal design of communicating the pestilence to his fellow-creatures, indignation and horror take the place of pity. I am not vain enough to pronounce what is the extent of Diderot's and D'Alembert's learning and capacity; but, without an over-fond opinion of myself, I may judge of

the subordinate atheists, the mob of the Republic of Letters, the Plebeula who have no opinions but what those their arbitrary tribunes dictate to them; and in these I have generally found the grossest ignorance. The cause of modern atheism, I believe, like that of the atheism of antiquity, as Plato represents it, is the most dreadful ignorance, disguised under the name of the sublimest wisdom. You do well to say that Plato does not favour their opinions. I fear these self-erected idols of modern philosophy, had they been born among the philosophical magnates, would have been but outcasts and exiles; for, if you have read Plato lately, you will remember that, among his laws, some were to be enacted for maintaining an uniformity of language in matters of religion in all times and places, in all writings and conversations; others for obliging all men to worship the gods with the same ceremonies, and to prohibit all private sacrifices; others, again, for inflicting the severest punishments on any who should dare maintain that the wicked can be happy, or that the useful can be distinguished from the just. So totally does the authority of the ancients, on which the advocates for unbounded toleration build so much, upon occasion fail them."

Of Lord George Gordon's riots there are many curious particulars, but we quote only a few words on the subject—the sentiments of the writer, after mentioning the address of the Lords to the King that the authors' abettors and instruments of these outbreaks should be prosecuted with rigour. Sir S. observes, "Severity is a very dangerous instrument for suppressing religious fury. You know how often the guiltiest sufferers in such a cause are elevated into martyrs, and how a fanatical preacher may work upon his hearers to court a death which is instantly to be rewarded with a crown of glory."

The next portion of the work consists of the correspondence from 1792, and touches a good deal on the revolutionary movements in France. Thereon we have some strongly-marked opinions; for instance, in a letter to Dumont:—

"I observe that in your letter you say nothing about France, and I wish I could do so too, and forget the affairs of that wretched country altogether; but that is so impossible, that I can scarcely think of any thing else. How could we ever be so deceived in the character of the French nation as to think them capable of liberty!—wretches, who, after all their professions and boasts about liberty, and patriotism, and courage, and dying, and after taking oath after oath, at the very moment when their country is invaded and an enemy is marching through it unresisted, employ whole days in murdering women, and priests, and prisoners! Others, who can deliberately load whole wagons full of victims, and bring them like beasts to be butchered in the metropolis; and then (who are worse even than these) the cold instigators of these murders, who, while blood is streaming round them on every side, permit this carnage to go on, and reason about it, and defend it, nay, even applaud it, and talk about the example they are setting to all nations! One might as well think of establishing a republic of tigers in some forest in Africa, as of maintaining a free government among such monsters."

Dumont's answer from Bowood shews how Reformers' hopes may be disappointed, and their initiatory proceedings punished, when

they have gone too far, and others will not suffer them nor revolution to stop:—

"I walk about half the day in a state of the greatest agitation, from the impossibility of remaining still, with my thoughts fixed upon all the sad events which are flowing from a source whence we had flattered ourselves human happiness was to arise. Let us burn all our books, let us cease to think and dream of the best system of legislation, since men make so diabolical a use of every truth and every principle. Who would believe that with such noble maxims it would be possible for men to give themselves over to such excesses, and that a constitution, the most extravagant in point of freedom, should appear to these savages the code of tyranny! The past is hideous; but what is still more frightful is, that there is nothing to expect, nothing to hope, from the future. We shall see nothing but destruction and massacre. Unless France should separate into a great number of independent states, it is impossible to form an idea in what way order is to be re-established."

A very remarkable and sad story of a man murdered in consequence of a *too clever defence*, will close our extracts for this number:—

"A case has been lately laid before the attorney-general and me, by direction of the Lords of the Admiralty, to consider of the expediency of prosecuting for a libel the printer of a weekly newspaper called the 'Independent Whig,' which has brought some facts to our knowledge that demand the most serious attention. A sailor of the name of Thomas Wood was tried by a court-martial at Plymouth on the 6th of October last, on a charge of having been concerned in the mutiny and murders which were committed on board the *Hermione*. It was in September, 1797, that the mutiny took place; and the prisoner being only, as was supposed, of the age of twenty-five when he was tried, could not have been more than sixteen when the crime was committed. The fact was proved but by a single witness: that witness, however, who was the master of the *Hermione*, swore positively that the prisoner, who, he said, at that time bore the name of James Hayes, was the very man whom he remembered on board the *Hermione*; and that he saw him taking a very active part in the mutiny. Notwithstanding the positive oath of the witness thus identifying the prisoner, yet, as the witness said that he had never seen the prisoner since, and as the appearance of a man generally changes very considerably in the nine years which elapse between the ages of sixteen and twenty-five, little reliance could be had on such testimony. It was, however, the only evidence in support of the prosecution. But what was wanting in the evidence for the crown was supplied by the prisoner's defence. It was delivered in, in writing, and was, in truth, a supplication for mercy rather than a defence. The following passage contains the whole substance:—'At the time when the mutiny took place, I was a boy in my fourteenth year. Drove by the torrent of mutiny, I took the oath administered to me on the occasion. The examples of death which were before my eyes drove me for shelter amongst the mutineers, dreading a similar fate with those that fell, if I sided with, or shewed the smallest inclination for mercy; and then follow entreaties for compassion on his youth, and a declaration that he had not enjoyed an hour's repose of mind since the event took place. The court found him guilty; he was sentenced to be hanged; and, on the 17th of October, the sentence was

\* "The massacres at Paris took place on the 2d, 3d, and 4th of September."

executed. In the meantime, his brother and sister, who were in London, heard of his situation, and made application at the Admiralty. They insisted that their brother was innocent; that he was not even on board the *Hermione*, but was serving as a boy in the *Marlborough*, at Portsmouth, at the time the mutiny took place; they procured a certificate of this fact from the Navy Office, and transmitted it to Plymouth, where it arrived previous to the execution. The guilt of the prisoner, however, appeared so manifest from his own defence, that no regard was paid to the certificate, and the execution took place. This proceeding was animadverted on in the '*Independent Whig*,' in several successive papers, with very great severity. The members of the court-martial called upon the Lords of the Admiralty to punish the author of these libels; and, in consequence of this, they were laid before us. The attorney-general suggested, at the consultation, the propriety of making some inquiry into the fact before the prosecution was instituted. We neither of us entertained any doubt of the man's guilt; but yet the attorney-general thought that it would be advisable, to be able to remove all possible suspicion upon that point. An inquiry was accordingly set on foot by the solicitor of the Admiralty; the result of which was that the man was perfectly innocent, and was at Portsmouth, on board the *Marlborough*, when the crime was committed in the *Hermione*. He had applied to another man to write a defence for him; and he had read it, thinking it calculated to excite compassion, and more likely to serve him than a mere denial of the fact. The attorney-general prevented any prosecution of the printer."

## HANSARD'S BOOK OF ARCHERY.

[Second notice: conclusion.]

WE promised our readers a second shot at archery; and we cannot display more accuracy than from Alexander Cockburn's details of his wanderings on the shores of the Isthmus of Darien:—

"After describing how these hospitable Indians detained him several days in order that he might recruit his strength, and heal with the juice of herbs the wounds he had received in 'fencing with the rocks,' he adds, that the two boys grew extremely attached to him, and were curious to know whether he could use a bow and arrows. Having made them understand, in broken Spanish, that he was entirely unacquainted with them, because, in his own country, guns only were used, they often displayed astonishing feats of dexterity by striking down the smallest bird flying. He says that he has seen them stand perhaps a hundred yards from a bird feeding upon the ground, and, by shooting directly upwards, cause the arrow to pin it to the earth; and mentions, as a further instance of their skill, that they would stick a shaft upright, and, retiring a great way off, shoot perpendicularly as before, when the arrow so shot descended exactly upon the other which was fixed in the ground, and split it in two."

William Tell, or Robin Hood, could not excel this; but we pass to other points:—

"A perusal of those laws which, until within the last two centuries, make the use of the bow compulsory on all male children, will shew there is nothing 'strange or singular' in the shooting matches which once prevailed at all our public schools, and which were retained by a small number until within a comparatively recent period. At many, as Eton, the college school of Warwick, &c., the custom may be

recognised in the appellations still borne by a portion of their respective play-grounds: in the former styled 'shooting fields,' in the latter 'butts.'

To prevent the monopoly of foreign bow-staves, numerous regulations were also passed, one of which I here present to the reader, because it has escaped the notice of previous writers. It is found in a volume of statutes, without date, in the library of Earl Spencer.—'Item, for as much as the great and ancient defence of this realm hath stood by the archers and shooters, which is now fallen to decay from the dearth and excessive price of long bows, it is therefore ordained, that if any person or persons sell any long bow over the price of three shillings and four pence, then the seller or sellers of such bow to forfeit, for every bow so sold, the sum of x shillings to the king.'

We may observe, that other games and sports were often forbidden, in order that they might not interfere with, or seduce the people from, practice with the bow. But homeward!—

"The Ancient and Worshipful Company of Stringers still survive. They possess a hall somewhere in the city of London, although their vocation has long ceased. I believe few bowstrings are now made in England, the great mart being Flanders, where both materials and workmanship are excellent. \* \* \*

The woods used for modern arrows are lance-wood, lime, asp, deal, and poplar. Of the last, the French and Flemings make theirs, and call it *arbelé*. Lance and lime are confined to roving shafts. Of deal the fletcher chooses the lintels, doors, and wainscoting of old houses, in preference to new timber. I once saw some very beautiful arrows, which Waring sent into the country, with a note, stating that they were made from deal upwards of a century old; yet the white wood he commonly manufactures is so truly excellent, that it leaves nothing for the archer to desire. In early ages they seem to have preferred asp for making war arrows. The poet Spenser, when enumerating the different kinds of trees indigenous to the British isles, and the uses to which their timber was applied in his time, speaks of

'The sailing fir, the cypress death to plaine,

'The shooter eugh, the asp for shaftes so faine.'

The vast consumption, indeed monopoly, which the public service thus created, was productive of a very droll contest between the fletchers and another class of men, of a somewhat less romantic calling, viz. the 'poure patyn makers of London.' In the early part of Henry V.'s reign the former presented a memorial, praying that these patten makers might be altogether prevented from using asp, which, it appears, they had gradually been substituting for willow, alder, &c.; and, in consequence, asp-wood was become so scarce that sufficient could not be procured for arrows, which had been greatly increasing in price. Independently of its fairness, a request of this nature might be expected to awaken the fullest sympathy in the breast of the warlike Henry. Little more than a twelvemonth had elapsed, since, at the head of his yeomen archers, he

'Cropped the fleurs-de-lis of France,'

and made its monarch a tributary of the British crown. The fletchers were, therefore, protected by a penalty of 100s. on every pair of clogs thenceforward manufactured of asp-wood; but, as this regulation was very severely felt by the traders in these articles, which, it would appear, the miry condition of London streets in the fifteenth century rendered indispensable to both sexes, 'the poure patyn makers' got up a

counter-petition, in which their grievances are thus pathetically enlarged upon:—'Mekely beseechen unto your noble wisdomes, the pouere felshipp of the crafte of patymakers, piteously complayninge of the grevous hurtes and losses that other persons, sometyme of this oure crafte, now dede, and alsoe your beseechers have of long tyme borne and sustained. It is soe, righte worshippfull sirs, that the sayde tymbre of aspe is the best and lightest tymbre to make patyns and clogges, and most easiest for the wear of all estate gentils, and all other the king's people, of any tymbre that groweth. And there is much tymbre of aspe that will in no wise serve the fletchers to make arrowes of, which is as sufficient, able, and accordinge to make into patyns and clogges, as is the remnant of the said tymbre to make arrowes.' The privy council contrived to keep the peace between both litigants. They issued an order, allowing their petitioners the use of all such asp-wood as, from its length, knottiness, or cross-grain, was rejected by the rival craftsmen."

Mr. Catlin, whose American Exhibition is now so deservedly popular at the Egyptian Hall, states that these puny-looking arrows which we see there are discharged with such force that they will pierce right through a buffalo, and wound or kill one on the other side; but we pause to conclude with a softer specimen of the weapon, and in fairer hands. In Persia—

"The butts consist of moistened sand, inclosed in a wooden frame, and beaten into a hard compact mass. These are set up in a slanting direction at the boundary of some verdant alley, where the overarching branches of vine and orange-tree exclude the fierceness of an eastern sun. Consistent with that gorgeous taste so prevalent throughout the East, the whole exterior of the butt is covered with elegant scroll-work and patterns of flowers. Gold and silver, intermingled with various pigments of the most brilliant hues, are lavishly employed to produce this effect. A female Abyssinian slave stands beside the mark, provided with a large round pebble, to form and preserve an unbroken hollow in the centre, and at this cavity every arrow is directed. She repeats the operation several times whilst her mistresses are shooting; for the triumph of Persian archery consists, not merely in a central shot, but also in making the arrow penetrate deeply into the sand at every discharge. At the termination of their sport, these farr butt shooters scrupulously conform to a remarkable custom, which, from remote antiquity, has prevailed among Persian bowmen of the other sex. Know, ladies, the followers of the Prophet divide themselves into two great sects, who hate each other with a cordiality worthy of the most polished nation of Europe. The Persians are devout followers of the Caliph Ali, and regard the Turks and other disciples of his antagonist, Omar, as a sort of Mahomedan heretic. To assist in perpetuating the memory of this religious feud, the Persian archer, on discharging his arrow at the mark for the last time, fails not to pronounce the charitable aspiration of 'Ter a kir dirdil Omar!'—Would that this arrow might bury itself in the heart of Omar! It must be highly amusing to witness the affected change which comes o'er the spirit of these orthodox beauties, whilst thus denouncing the heretic caliph. Gay, innocent, and thoughtless, it were absurd to suppose they have the least real feeling on such a subject. Still, like prattling parrots, their lesson is repeated, with many a pretty indication of dis-

pleasure, akin to that of the 'wrathful dove, and most magnanimous mouse.' Eyes which, a moment before, beamed with the softest expression, now dart forth flashes of anger, like the opening storm-cloud. Pretty mouths, so lately wreathed in smiles, are tortured into an expression of the most inveterate contempt. But, no sooner does the glancing shaft quiver within its destined mark, than Ali as well as Omar are consigned to oblivion; and songs, and laughter, merry and musical as the chime of silver bells, again re-echo through the perfumed walks of their magnificent pleasure-garden. Bows, arrows, and the costly sefin,\* are speedily abandoned to the attendant slaves; and, with a zest which their recent occupation is so well calculated to supply, the fair revellers hurry off to

\* Taste the goods the gods provide them.

in the splendid luxuries of an Oriental banquet."

Our own modern archery associations and feats are so often described in the newspapers, that we deem it unnecessary to advert to the Gwent Bowman's accounts of them, or of the exploits in his native Wales, which he fails not to magnify with genuine patriot feeling. It is a healthful and beautiful exercise, and would well become the Queen herself, who, we fancy, never handled a bow, except in the frontispiece to this volume, where she is shooting very gallantly.

#### BENNETT'S VOYAGE ROUND THE GLOBE. [Second notice.]

WE return with pleasure to Mr. Bennett's various topics, and there are none of them perhaps more striking, even in the whole circle of the globe, than the descriptions he gives us of the innumerable hosts of life that animate the boundless waves:—

"At midnight, on the 1st of December, in lat. 19° N., long. 107° W. (half way between the group of Revilla-gigedo and the continent of America), the sea around us presented one uniform milk-white and luminous expanse, as far as the eye could see from the mast-head. It emitted a faint light, like that which attends the dawn of day, and bore a near resemblance to a field of snow reflecting the rays of the moon; the horizon being strongly defined, by the contrast of its bright and silver hue with the murky darkness of the sky above. Close to the ship the water appeared brighter than elsewhere, and the dashing of the waves against her bows produced brilliant flashes of light; but it occurred very strangely, that although the waves could be heard lifting in the ordinary manner, it was difficult to perceive them; and the sea appeared as one tranquil, unbroken surface. A net and a bucket were employed to ascertain the cause of this phenomenon. The former captured nothing but a few medusæ, of no phosphorescent power; and the water taken up by the bucket, though it was thickly studded with luminous points, contained no tangible bodies. A shoal of porpoises came around us at this time; and as they sported in the luminous ocean, darting rapidly beneath the surface, their dark bodies enveloped, as it were, in liquid fire, they tended to complete a scene which, if correctly pictured, would appear rather as the fiction of a fairy tale than the effect of natural causes. This sudden and mysterious change in the appearance of the sea occasioned an alarm of shoals; and the lead was cast, but no soundings could be obtained. Nevertheless, the ship was hove-to till day-

\* Thumb-rings for drawing the bowstring.

break, when, as the sun arose, the luminous aspect of the water as gradually disappeared, and gave place to the normal blue tint of a clear colour."

A preceding account is still more instinct with animal existence:—

"During a dark and calm night, with transient squalls of rain, in lat. 43° S., long. 79° W., the sea presented an unusually luminous appearance. While undisturbed, the ocean emitted a faint gleam from its bosom, and when agitated by the passage of the ship, flashed forth streams of light, which illuminated the sails and shone in the wake with great intensity. A net, towing alongside, had the appearance of a ball of fire followed by a long and sparkling train; and large fish, as they darted through the water, could be traced by the scintillating lines they left upon its surface. The principal cause of this phosphorescent appearance was ascertained by the capture of numerous medusæ, of flat and circular form, light-pink colour, and eight inches in circumference; the body undulated at the margin, spread with small tubercles on its upper surface, and bordered with a row of slender tentacles, each five feet long, and stinging sharply when handled. The centre of the under surface was occupied by a circular orifice, or mouth, communicating with an ample interior cavity, and surrounded by four short and tubular appendages, which, when conjoined, resembled the stalk of a mushroom—a plant to which the entire animal bore much resemblance in form. When captive, the creature displayed a power of folding the margin of the body inwards; but its natural posture in the water was with the body spread out, and the tentacles pendent. When disturbed, this medusa emitted from every part of its body a brilliant greenish light, which shone without intermission as long as the irritating cause persisted, but when that was withdrawn the luminosity gradually subsided. The luminous power evidently resided in a slimy secretion which enveloped the animal, and which was freely communicated to water, as well as to any solid object. When thus detached, it could be made to exhibit the same phosphoric phenomena as the medusa itself; hence, it is reasonable to suppose, that the gleam of the ocean arose no less from the luminous matter detached from these creatures than from that which adhered to them; and I was further satisfied on this point, when I found that immersing the medusa in perfectly clear and fresh water communicated to that fluid all the scintillating properties of a luminous sea. Though the discovery of these medusæ was a satisfactory explanation of the phosphorescent appearance of the water, I had yet to learn that the latter effect was partly produced by living, bony, and perfectly organised fish: such fish were numerous in the sea this night; and a tow-net captured ten of them in the space of a few hours. They were a species of *Scopelus*, three inches in length, covered with scales of a steel-grey colour, and the fins spotted with grey. Each side of the margin of the abdomen was occupied by a single row of small and circular depressions, of the same metallic-grey hue as the scales; a few similar depressions being also scattered on the sides, but with less regularity. The examples we obtained were alive when taken from the net, and swam actively upon being placed in a vessel of sea-water. When handled, or swimming, they emitted a vivid phosphorescent light from the scales, or plates, covering the body and head, as well as from

the circular depressions on the abdomen and sides, and which presented the appearance of as many small stars, spangling the surface of the skin. The luminous gleam (which had sometimes an intermittent or twinkling character, and at others shone steadily for several minutes together) entirely disappeared after the death of the fish. In two specimens we examined the contents of the stomach were small shrimps."

In a brief but satisfactory essay on marine phosphorescence, in the Appendix, Mr. Bennett adds some further information on this interesting subject; from which we extract the following general and individual remarks:—

"In the great majority of cases, a phosphorescent sea would betray its history, by affording to the tow-net numerous examples of luminous animals; sometimes fishes or shell-fish, but more commonly molluscs or medusæ. The fishes, shell-fish, and tunicated molluscs, have their luminous matter deposited beneath a dense integument, and consequently do not communicate it to the waters they infest; but this does not apply to all the medusæ, as some of them are indebted for their phosphorescent quality to a peculiar secretion, that covers their body in the form of a slime, which is easily washed off, and, diffusing itself through water, communicates to that fluid a luminous appearance, which may be entirely independent of the actual presence of the animals from which it is derived: and this, as I have elsewhere observed, may in a great measure account for the occasional existence of a luminous sea, in which no tangible luminous bodies can be detected. The greater number of the luminous marine animals we noticed during this voyage have been described in their proper places; but there were some others, medusæ, captured under circumstances when cause and effect were satisfactorily displayed, which I shall now mention. The one species, which we captured in vast numbers in the North Pacific, is circular, gelatinous, and transparent, and about the size of a dollar; its upper surface convex, and marked with radiating grooved lines. The centre of its inferior aspect is concave, while the circumference is a comparatively broad, flat margin, which, when viewed at night, and in the living animal, is seen to be studded with a row of luminous dots, placed equidistant from each other, and shining with a delicate blue light. When the creature is allowed to be quiet, the luminous display is confined to this series of dots; but, when irritated by handling (or, we will suppose, by the agitation of the waves), the entire body emits a powerful light; which is not, however, so clear and fixed as that of the pyrosoma, but has rather a rough, or powdered appearance. A slimy secretion, which is easily removed from the body of this medusa, also shines brightly when rubbed, and appears like many twinkling stars, vanishing and again lighting up, and seeming to run from spot to spot. When these creatures are assembled in their natural element, they present as many circular patches of light, gleaming brightly, and the more vividly where the sea most breaks: their lights undulating with the waves, alternately appearing and vanishing, and passing, as it were, suddenly to different parts of the ocean, otherwise in obscurity, giving the effect of many torches moved quickly through the depths of a dense and darkened forest. A second species is a very curious medusa (independent of its luminous economy), and was also commonly captured in many parts of the North Pacific. It is about three inches in length by two in circumference; of a somewhat cylindrical form, slightly tapered

at one extremity; is perfectly transparent and colourless; and has the crystallised appearance of cut-glass. The entire animal is composed of an aggregation of numerous smaller crystal-like parts, each closely resembling the other in its shape, which is that of the slice of an orange cut vertically. These individual parts are but slightly united to each other, but are more firmly attached to a soft white cord that passes through the centre and entire length of the perfect animal. When removed from the water, this medusa displays spontaneously, and from its whole surface, a vivid phosphoric light, little inferior to that of pyrosoma; and, when agitated in fresh water, it communicates to that fluid a multitude of scintillating particles, which emit a very white gleam. We found many distinct varieties or species of this medusa. They differ in size and form; some being eight inches in circumference by three in length, and nearly cylindrical in form; while their aggregate portions, all uniform in shape, are pyramidal, and present four facets. Others are globular, and resemble a mulberry. But they all agree in possessing a curious resemblance to crystals, both in their entire form and in the shape of their component parts, and have the same highly luminous properties. A third luminous medusa, which we obtained in lat. 40° north, long. 142° west, is about one inch in length, and shaped like an open bag, or landing-net, its one extremity being a wide circular orifice, while the opposite is rounded and closed; its gelatinous structure is enveloped in a smooth membrane or tunic. The interior of the body is one capacious cavity, or sack; its bottom occupied by a fringed structure, of a pink colour; numerous short slender tentacles are attached to the border of the circular orifice; and the upper surface of the same border, which is somewhat broad and thick, is provided with a single row of small red tubercles, which, as well as the entire body of the creature, emit in the dark a very bright phosphorescent gleam. This species does not communicate any luminous matter to either fluids or solids in contact with it. Upon more than one occasion I have taken from the ocean a small amorphous, transparent, and gelatinous medusa, which, when irritated, emitted a vivid, rich-green light, and at the same time a very strong odour, which resembled that produced by the fumes of muriatic acid. There can be no doubt that many interesting and important facts relative to the history of luminous marine animals are lost to zoology, from the circumstance of illustrative specimens being captured in broad daylight (when their characteristic gleam is invisible), and when the test of a darkened apartment has not been employed in their examination; and this the more particularly, as there is seldom any other external sign than their refulgence to denote what living creatures possess the peculiar property of emitting phosphorescent light. It is difficult to say in what manner this luminous quality may be of use to marine animals; or rather, so many uses may be assigned, that it is hard to fix upon the one which is most satisfactory. I cannot believe with Mr. Kirby, that it serves as a mode of defence; because, from what we know of the nature of fishes, this refulgence would be one of the surest means of bringing their probable enemies upon them; and if we are to regard the economy in a destructive point of view, we might rather suppose that it is intended to direct the nocturnal predacious fishes more surely to their food; for it is well known that they are easily attracted by strong lights, and that there is no better bait for capturing

oceanic cuttle-fish than a circular piece of glittering tin, armed with hooks, and lowered into the sea at midnight. But it would be unjust to accuse Nature of thus wantonly investing her creatures with a charm that can only tend to their destruction. In some land-insects a nocturnal light is supposed to be an amorous incentive; but this will scarcely apply to the lowly-organised medusæ: nor is it altogether probable that their light is given them to attract their minute prey, although such hypothesis will apply well to the luminous species of shark and scopolus which I have had occasion to describe. On the whole we are compelled to admit, that no very prominent or indisputable purpose can at present be attributed to this wonderful display."

In our next we must turn back a little to the details of the voyage, and, leaving the Marquesas, pause a moment at Caroline Island, which is a remarkable and most distinct example of the coralline formations for which we are indebted to new and wonderfully enlarging quarters of our earth. For the present we must stop.

## MISCELLANEOUS.

*Gideon Giles the Roper. Part I.* By Thomas Miller, author of "Royston Gower," "Lady Jane Grey," "Beauties of the Country," &c. &c. Pp. 32. London, 1840. Hayward and Moore.

MR. MILLER has in this part commenced a consecutive narrative, to be continued fortnightly and monthly, and which, as far as can be judged from such a fraction, bids fair to be full of interesting matter, well-drawn character, and natural description. A midland country hostelry with its inhabitants; Gideon Giles and his family, including a sweet maiden daughter; Sir Edward Lee with his plans of seduction, accomplices, and innocent household; Ben Brust, a complete lounging scapegrace not destitute of good qualities; and Master Walter the hero, are all introduced under imposing circumstances; and if the sequel keep pace with the opening, we may predict that neither the admirers of truthful drawing, of quiet humour, nor of touching situation and pathos, will have cause to be disappointed with this new effort in the now common race of periodical publication. The embellishments are not so well executed as could be wished, at a time when competition in this way runs so high.

*Brother Jonathan; or, the Smartest Nation in all Creation.* Edited by Paul Patterson, and Illustrated by R. Cruikshank. No. I. pp. 32. London, 1840. Cunningham.

BROADLY drawn and perhaps caricatured, this is an amusing picture of New York folks and fashions. The descriptions are droll and laughable enough.

*The Devil on Two Sticks.* Newly Translated by Joseph Thomas, from the French of Le Sage. Illustrated by Tony Johannot. Part I. pp. 32. 1840. London, Thomas; Dublin, Machin and Co.; Edinburgh, Sutherland; Manchester, Ainsworth and Sons; Liverpool, Davies and Co.

WE have seen nothing like this in *Numerical* publication. The wood embellishments are most spirited and replete with character; and there is a subject in almost every page, so that they do not cost so much as a halfpenny a-piece!! Asmodeus himself, in the frontispiece (by Brevière), is a masterly sketch; and the tail-piece, page 18, is as fine as the "Aurora" of Guido. But all are excellent,—*"The Miser,"* p. 21; *"The Maimed Gallant,"* p. 23; *"The Aged*

*Coquette,"* p. 24; *"The Musical Party,"* p. 25; *"The Couche,"* p. 26; *"The Fair Damsel,"* p. 12; and *"The Gamblers"* on the opposite page, are but instances of the invention and talent lavished upon this very cheap publication.

*Charles O'Malley, the Irish Dragon,* by Harry Lorrequer. Illustrated by Phiz. Nos. I. and II. (Dublin, Curry and Co.; London, Orr and Co.)—We are glad to see Harry Lorrequer (*alias*, Mr. Lever) again in the field with a genuine stirring Irish story, full of vigour and fun. The characters are boldly drawn, and in these two Nos. an election contest, and the means of terrifying a Saxon visitor, are described with ludicrous effect.

## ORIGINAL CORRESPONDENCE.

## THE JEWS.

To the Editor of the Literary Gazette.

Paris: April 28, 1840.

SIR,—The intelligence of the murder of Father Thomas and his servant at Damascus reached Paris some time before it was made public in London, the original source of the information being a letter of the 21st of February, from Beyruth in Syria, which was quoted by the "Semaphore" of Marseilles, and republished in this capital on the 17th of March. The Austrian government has already interfered, and we are rejoiced to learn from the pages of your admirable journal that application has been made to the British government, with a similar object in view. The French consul at Damascus, M. Ratti-Menton, appears to have acted both courageously and humanely in trying to postpone the executions of the poor Jews who had been so blindly condemned to death, but we have this day received in Paris the intelligence that nine have actually been hung; while, on the other hand, we also learn from Alexandria that the real murderer has been discovered, and that he is one of the fierce religious sect of the Druses, and, therefore, no Jew. The whole truth will no doubt come out some day or other; but, meanwhile, it is not without use to represent to your readers how the case at present stands before the public.

On Wednesday, the 5th of February, Father Thomas and his servant went round the town, according to custom, to administer vaccination, especially to the poorer classes, and in so doing they entered various houses of Catholics and Armenians, as well as Jews. They never returned to their convent, of which Father Thomas was the superior; and next day, some Turks and Greeks entering the Jews' quarter of the city, affirmed that Father Thomas had been seen there the day before, and that some one had murdered him. A barber of the lowest class was seized and dragged before the pacha, who, on his declaring that he knew nothing about the priest or his servant, was ordered to have 500 strokes of the bastinado on the soles of his feet, to make him confess. He received this punishment, but still persevered in his denial; upon this he was subjected to the most excruciating system of tortures, one of the methods being to squeeze his head with an iron band till the eyes started from their sockets. His black beard turned white from the pain he endured. After this, he said that he had seen Father Thomas walking with Davud Arari, the richest Jew merchant of Damascus; and upon similar testimony, that unfortunate individual, with his brothers and two rabbins, nine in all, were seized and instantly tortured. At the same time, all the Jewish children at the public school were thrown into a dungeon, chained, and allowed only one ounce of bread and a glass of water per diem, in order to force their parents to come forward and make accusations. The wealthy Jews thus imprisoned and racked denied all knowledge of the affair im-

puted to them, and pointed out its utter inconsistency, especially as to the absurd accusation of their using blood, the very thing of all others forbidden by their law. Another Jewish inhabitant, who had gone to the pacha to remonstrate, was seized and beaten to death. The barber, still subjected to torture, made fresh accusations: the rich Jews had their houses pulled down by the pacha, to look for the body of Father Thomaso, and were themselves taken to the pacha, *παρα τα δαδια ἰλασμένοι*, and thrown into a common sewer of the city. This overcame their constancy; they admitted all that was imputed to them, and have since been hung!

The accusation of the bodies of Father Thomaso and his servant having been concealed in a drain, is disproved by the fact of the bones discovered being shewn to be those of quadrupeds: the idea of the sacrifice, &c. is too absurd to be entertained for an instant: but the mere fact of the richest men in Damascus having been singled out as the victims, added to the known rapacity and unscrupulousness of Oriental local governors, is sufficient to afford a very fair presumption as to the circumstance being seized on as a favourable one for confiscating the wealth of the accused parties, and enriching the governor's own private pocket. There is extant a curious letter from the Rabbins Manasses to Oliver Cromwell, in which exactly the same story, nearly word for word, as to the terms of the accusation, is exposed to the Protector: and, indeed, the records of most of the great cities of France and Germany abound in accusations of the same nature against the Jewish inhabitants during the middle ages. Since the eminent and wealthy individuals in London, whom you mentioned in your last number, and than whom a more benevolent and philanthropic set of men does not exist, have come forward in behalf of their oppressed brethren, the case has lost much of its interest, as there is now no doubt of its being thoroughly sifted to the bottom. It would, however, be a most desirable thing if the British consular and diplomatic authorities in the Levant were instructed to ascertain the truth of this matter, and if something could be done to prevent the recurrence of such scenes of horrid barbarity. It would be a very painful thing to think that any English visitor of the regions of the East should not at all times exercise the strong good sense that characterises our nation, and, above all, should not extend his hand as a Christian to a Jewish brother oppressed by fanatical barbarians. For myself, though I advocate the cause of the Jews in this instance, I am no Jew myself, and I have ventured to call your attention to the case solely from a love of truth and a sense of humanity. I remain, sir, your obedient servant and constant reader,

PHILALETHES.\*

#### ARTS AND SCIENCES. GEOGRAPHICAL SOCIETY.

APRIL 27.—Mr. Greenough, F.R.S. President, in the chair.—The following papers were read. 1. 'Narrative of the Recent Arctic Discoveries, by Messrs. Dease and Simpson,' communicated by the Hudson's Bay Company. This account, which has been made public, was illustrated by a chart of the coast on a large scale, shewing the track of these enterprising explorers; and a smaller map of British North America on which their discoveries are already engraved, both by Mr. John Arrowsmith.—2.

A letter from Dr. Richardson, F.R.S., dated Haslar Hospital, Portsmouth, 25th April. "My dear Sir,—The success of Messrs. Dease and Simpson is delightful, and their despatch intensely interesting. Every Englishman who feels as he ought for the reputation of his country, must rejoice, that an enterprise which has been an object of national pursuit for 343 years, should be brought to a conclusion without the intervention of any other kingdom. It has been said that ours is a land whose merchants are princes, and if the liberal application of great wealth, and the enlightened patronage of science, are princely acts, the title is not misapplied. The first expedition for the discovery of the north-west passage, which sailed from Bristol in 1497, under the patronage of Henry VII., was fitted out at the cost of the Cabots, and other merchants; and to a mercantile body belongs the glory of bringing it to a conclusion. The Hudson's Bay Company giving the most honourable construction to one of the clauses of their charter, have prosecuted their discoveries on a coast, which, as it supports no fur-bearing animals, could not by any possibility yield a pecuniary return for their outlay; but the names of the directors, Governor Pelly, Mr. George Simpson, &c., who ordered the well-planned enterprise, will live in the grateful remembrance of their country, along with those of the two officers who executed it with so much bravery and skill. These two gentlemen, indeed, have, year after year, and under great privations, pushed on to the conclusion of their undertaking with a resolution and unity of purpose never surpassed in the annals of discovery, and their success has been as full as it was merited. There remains but a small portion of the Gulf of Boothia to be explored to complete the delineation of the northern coast of the American continent, and it is very gratifying to hear that the Hudson's Bay Company intend to accept of Mr. Thomas Simpson's offer to perform this also. The opinion of that gentleman as to the trending of the south shore of this gulf is entitled to the highest consideration and confidence, and one is glad to find that he entertains little doubt of its continuing to the west side of Melville peninsula, and consequently of Boothia being an island. The tracing of Victoria Land for 150 miles furnishes a reason for some peculiarities of the sea into which the Copper Mine river discharges itself; and, I think, nearly proves that from long. 117° to Boothia, the continent is separated merely by a strait from a piece of land absolutely or nearly continuous: that Wollaston Land is continuous with, or at least contiguous to, Victoria Land, I have scarcely any doubt. From a hill near Cape Krusenstern we saw the high land behind Cape Barrow, known to be about sixty miles distant, and the east end of Wollaston Land was seen at the same time, extending to the eastward as far as the eye could reach. Off Capes Bathurst and Parry, black whales were abundant; and the shores there furnished, by the elevation of the line of drift timber, an indisputable indication of a powerful ocean swell. After entering the Dolphin and Union Straits, whales were no longer seen, and the drift timber lay merely along the beach. A notion that the northern boundary of the strait just mentioned might be connected with Banks's Land of Parry, and the prominent station which Dr. Wollaston held in the scientific body over which Sir Joseph presided, were, in fact, the reasons for thus associating their names. And it is probable, from Messrs. Dease and Simpson using the term *land* to designate

the country which they have honoured with the name of Victoria, that they also entertained a belief of its extension to Wollaston and Banks's Land. I should be very glad to hear that her majesty had been advised to bestow some mark of approbation upon Mr. Dease and his able coadjutor, in the execution of an enterprise which cannot fail to be reckoned among the memorabilia of her reign.—I am, &c.

"JOHN RICHARDSON."

To Captain Washington, R.N.

3. 'Remarks on M. de Berton's Report of his Journey through Wadi-el-'Arabah from the Dead Sea to 'Akabah, in 1838,' by Edward Robinson, D.D. of New York, now at Berlin. "The statements of M. de Berton respecting the great valley el-'Arabah have been adopted, apparently without question, by Letronne, and thereby acquire an authority to which otherwise they might not have been entitled. For this reason, and for the sake of truth and science, I feel bound to point out several things in his account which I conceive to be erroneous, and to state the grounds on which my objections rest. His information respecting the topography of the country was derived chiefly from his Arab guides, between whom and himself it was manifest, from their mutual complaints, that no cordiality existed; and from the character of the Bedowins it is evident that, under such circumstances, their information cannot be relied on, whilst, from his own very imperfect knowledge of the language, he was unable to correct their misstatements. The evidence of this deficiency on the part of M. de Berton with respect to proper names appears in every page, which, together with other circumstances, casts a doubt on the extent of his own scientific knowledge, as well as accurate observation. With the great work of Laborde on Syria he was unacquainted, he first saw an English copy of it in our possession at Jerusalem, and there found that several of his discoveries had been already described by his countryman ten years before. I will now point out several things in his report which seem to me erroneous, which, if not corrected, might produce confusion in that remarkable region:—1st. Ez-Zuweirah, on the west side of the Dead Sea, M. de Berton holds to be the same as Zoar of the Scriptures, writing its name Zoara; this name has no affinity with the Hebrew Zoar, and there is decisive historical evidence that the ancient Zoar lay on the east side of the Dead Sea, probably on the opening of Wadi Kerak. 2d. Of the Wadi el-Jeib, the great drain of the 'Arabah towards the Dead Sea, M. de Berton speaks only as the Wadi el-'Arabah, yet our native guides and others constantly named it el-Jeib, and it appears under that name in the map and work of Laborde. 3d. To the remarkable hill or Tel of Madurah, north of 'Ain el-Weibeh, M. de Berton gives the additional name of Kadessa, supposing it the Kadash of the south of Judah. This name I believe is either a mistake or an invention of the writer; whilst encamped near we questioned the chief sheikh as well as the sheikh who had accompanied M. de Berton, but they knew nothing of the name; and Seetzen, Lord Lindsay, and Schubert, who travelled that way, heard of it only at Madurah: I believe 'Ain el-Weibeh is the probable site of Kadash. 4th. To the great Wadi el-Jeráfeh, as it enters the 'Arabah, and joins the Jeib nearly opposite Mount Hor, M. de Berton gives the name only of Wadi Talha. All our guides, both of the Tamarah and Amran, in the western desert and of the Jehálin and Haweitát along the 'Arabah, spoke of this

\* Some of these facts have appeared in other periodicals, but in none in so particular a shape as to divest our correspondent's letter of its strong interest.—Ed. L. G.

only as Wadi el-Jeráfah, and M. de Bertou had no other informants; Burckhardt, indeed, speaks of two Wadis, called Abu Talha, in the western desert, which probably flow into the Jeráfah, of which M. de Bertou might have heard, and transferred to the Wadi in question. 5th. To the southern half of the great valley between the Dead Sea and 'Akabah, which is called in its whole length 'Arabah, M. de Bertou assigns the name of Wadi 'Akabah. Now there are few facts better known than that this valley, from the Ghor near the Dead Sea quite to the Gulf of 'Akabah, bears among the Arabs the name of Wadi el-'Arabah, for which see Burckhardt, Laborde's map and work, Lindsay, Schubert, and all travellers. 6th. The water-shed, or line of separation of waters in the great valley, M. de Bertou places immediately south of the entrance of the Jeráfah into the 'Arabah; on this point I cannot speak with certainty, yet there is evidence which renders it probable that this water-shed is several hours farther south than the point assigned by M. de Bertou: 1st. All our Arabs born in the vicinity stated that the Wadi el-Jeib, the great drain of the 'Arabah towards the north, had its beginning in the great valley south of Wadi Ghüründel, and the waters of the latter valley flow towards the Dead Sea. 2d. The configuration of the lateral valleys of the 'Arabah, as they descend to it from the eastern mountains, first led Letronne to doubt the fact of the Jordan having flowed through the great valley. He fixes the probable line of division of waters about fifteen hours from the Dead Sea, more than two hours south of the opening of Wadi Ghüründel. That the lateral valleys in this quarter do thus run north-west, appears also from the testimony of Burckhardt and Schubert. Therefore, the same circumstance which led Letronne to doubt at all, exists in its full force to shew that the water-shed must be sought for on the south of Wadi Ghüründel. 3d. The testimony of M. de Bertou himself incidentally given, as in passing the mouth of the Jeráfah on his way south, he remarks, "Depuis la jonction du Talha (Jeráfah) avec l'Araba les Arabes donnent à ce dernier le nom de Ouadi Akaba." There is then a Wadi further south than the Jeráfah, with which the latter unites; and at three hours and a quarter from the mouth of the Jeráfah they halted at the place where Wadi Ghüründel unites with this Wadi, which corresponds with what we saw from the Pass of Nemela. Though to this winding Wadi south of the Jeráfah, M. de Bertou says that the Arabs give the name of Wadi Akabah. Yet several times he mentions it as 'Arabah, i.e. el-Jeib. This evidence appears to me to throw doubt on the correctness of M. de Bertou's assertion, that the dividing line of the waters in the great valley is adjacent to the mouth of the Jeráfah, and leads to the suspicion that this name of Wadi 'Akabah and this whole affair of a water-shed adjacent to Wadi el-Jeráfah, is an after-thought, got up in consequence of a subsequent hypothesis. When this region is properly explored, the beginning of the Wadi el-Jeib will probably be found at some distance south of Wadi Ghüründel, as reported by our Arabs. 7th. M. de Bertou affirms that the spot near the eastern mountain, just south of Wadi Abu Kushobah, is called El Saté, i.e. *le toit*: this does not seem probable; *sulah* signifies a plain or terrace, and is applied to the flat roof of a house, but which gives no idea of *pente* (ridge or slope). The same word is used in reference to the plain north of Wadi Musa, and to that extending to the foot of Mount

Hor; therefore if it does exist where he assigns it as a proper name, it can have no relation to a slope or dividing line of waters. These are the chief topics in the narrative of M. de Bertou, which seem to require either confirmation or correction; and I cannot but hope that succeeding travellers in that region will endeavour to ascertain the exact truth on those points which have been questioned.

In acknowledging a special note of thanks to the Governor and Committee of the Hudson's Bay Company and their spirited officers, Governor Pelly said, that the Committee had resolved not only to grant Mr. Simpson the "limited means" he asked for in his letter, but to supply him liberally with every thing he could require to complete the great work in which he had already taken so active a part; and he had every hope that, if favoured by circumstances, in the course of the next year he should have the pleasure of communicating to the Society the complete tracing of the northern coast of America.

## ZOOLOGICAL SOCIETY.

(Anniversary.)

At the Annual Meeting, held on Wednesday, the usual reports were read. The report of the Council was rather interesting. The number of fellows, or contributing members, at present is upwards of 3000.—The menagerie on the 1st of April contained 910 subjects, including 303 mammalia, 327 birds, and 20 reptiles; several species being new to this country. The Museum of the Society was alluded to with satisfaction,—it now rivals any on the Continent; the arrangement is almost perfect: the shelves, however, are so crowded, that numerous rare specimens were for the present kept in stores. It contains 1794 specimens of mammalia, comprising 800 distinct species; 5418 birds, comprising 3000 species; fishes, 1260; reptiles, 1034; the osteological collection, 386 perfect skeletons.—The report of the auditors of the Society's accounts was, upon the whole, favourable.—As we have from month to month stated the amount of cash balance carried to the Society's credit, details of the annual account are unnecessary.—The auditors express a hope that the success of the past year, "limited as it may seem," will serve as an encouragement to prosecute with renewed exertions the interesting objects of the Society.—The Earl of Derby was re-elected President, and the usual changes in the Council were judiciously made.

## PARIS LETTER.

Academy of Sciences, April 28, 1840.

SITTING of April 20.—M. Virey sent a notice to the Academy that in Vol. X. of the "Journal Complémentaire des Sciences Médicales," he had inserted a memoir upon a wax-producing insect of China, different from the one mentioned during the late sittings of the Academy. This insect was, as it were, buried in a mass of wax, which it extracted from the plant on which it lived, the wax being of a sweet flavour, and the children of the country gathering it to suck. This *Coccus ceriferus* was found not only in China but also in the East Indies, and had been examined and described by Mr. Pearson in the "Phil. Transact." 1794, p. 383. M. Virey mentioned that another ceriferous insect was found in Madagascar.

[We for the present pass memoirs on specific heat, by M. Baudremont and M. Regnault.]

Wool.—An important memoir by Professor Chevreul was presented to the Academy on the composition of wool, the process of extracting the natural grease from it, and certain properties

of the substance, interesting to manufacturers. M. Chevreul had been pursuing his experiments on wool for fifteen years. He had already proved, that when wool had been thoroughly cleansed it contained three evident substances: 1st, a fat substance, which remained solid at the ordinary temperature, and was liquid at 60° centigrade; 2dly, another fat substance, liquid at 15°; and, 3dly, a filamentous substance, which forms the elementary substance of woven stuffs. Some new experiments had shewn him that this latter substance, the filamentous one, contained hydro-sulphuric acid, which was fully entitled to be counted as a fourth component part of wool, and was often of great injury to manufacturers in their dyeing processes. His experiments to isolate this sulphuric element had lasted four years and a half. The two fat substances of wool corresponded to *stearine* and *laine*, only they admitted of being converted into soap; and therefore, to distinguish them, he had termed them *stearerine* and *élaiererine*. The following is a table of the results given by examination of, and experimentation upon, a Merino fleece:—

Earthy substances .....	26.06
Fat substances dissolved by washing.....	32.74
Fat matters .....	9.97
Clean wool .....	31.23
	100.00

In order to give an idea of his experiments, M. Chevreul went into long details of his highly ingenious and patient methods for the isolation of the sulphur; the ultimate result which he had been able to obtain was, that out of 100 parts of pure wool, there were still .46 of sulphur to be deducted. M. Chevreul then developed the importance of these results for manufacturers: he had already shewn that nothing was more prejudicial to printing on wool than the presence of certain salts of copper sometimes to be detected in the stuffs, and which always caused a partial discolouration. He had recommended that iron cylinders for printing should be used instead of copper ones, together with other precautions: he had now clearly ascertained that the discolourations were caused by a sulphate of copper, resulting from the reaction of the sulphur of the wool on a coppery matter, the presence of which was accidental; and he pointed out the importance of these results to all dyers of woollen goods. M. Chevreul further remarked, that the fat component substance of wool entered into it in the same proportion as the oil which was added to it when thoroughly dressed, in order to make it fit for spinning. If any difference was found in the weaving of wool when merely washed, and of wool thoroughly dressed, it must be accounted for by the fat substance formed by the *stearerine* and the *élaiererine* not being so liquid as oil, and by the former retaining in the wool a certain quantity of earthy matter, very much subdivided, which made the filaments hard to work. The discovery of the sulphur remaining in the substance of the wool, and standing repeated processes with various metallic oxides and alkaline bases, and still adhering to the wool after four years' constant experimentation, was considered by the Academy as a circumstance highly curious.

M. Persoz addressed to the Academy a new memoir on sulpho-sulphuric acid and its combinations.—M. Cauchy laid on the table a memoir on some new researches upon the theories of series, and the laws of their convergence.

Academy of Moral and Political Sciences.—M. Moreau de Jonnés gave some further ex-

planations of the method adopted since 1837, for procuring more exact statistical returns on the condition of agriculture in France. He stated that researches had been, or were to be, set on foot, in each of the 37,000 communes into which the country is subdivided, and that information was there collected from the persons on the spot, by whom the returns were examined and verified.

**Academy of Medicine.**—M. Blandin read a report on M. Foville's "Memoir upon the Head and Brain." In the first part of this memoir the author considered the brain as divisible into two planes of fibrous parts, emanating from the grey substance, and to each of which he allotted distinct functions: to one, that of transmitting to the nerves the orders of the will; to the other, that of transmitting to the brain the sensations perceived by the nerves. The second part of the memoir referred to the sutures of the skull, and to the relation of the bony case of the head to the brain. Ordered to be printed in the "Transactions."—M. Boullée, a chemist and druggist at Auch, had demanded a patent from the Minister of Commerce for the invention of a remedy for gout and rheumatism, consisting of sarsaparilla, julap, and mustard. The Academy, after a discussion, in which it was decided that the alleged remedy had been long known to the public, and was also a very ineffectual one, decided on drawing up a report to the Minister against the concession of a patent.

**The Royal and Central Society of Agriculture** held its annual public sitting at the Hôtel de Ville on the 26th of April, the Minister of Commerce being in the chair.—Several prizes for the propagation of the culture of mulberry-trees and silk-worms were awarded; and a gold medal given to M. de Tillancourt, V.P. of the Agricultural Society of Château Thierry, for the introduction of the mulberry-tree into that commune, and into that of Eprenay.

**The Royal Academy of Sciences and Belles Lettres** of Toulouse, in its last sitting, heard a curious notice read by M. Frizac, a local geologist, entitled, 'On the Pavement of Toulouse, considered in a geognostic point of view.' In this paper the author estimated, that out of 100 parts of the paving-stones of that town the following were the proportions of the various substances:—Granite, 16; gneiss, 10; syenite, 8; quartz, 16; jade, 9; amphibolite, 15; Lydian stone, 7; melaphyre, 5; ophites, 6; pudding-stone, 4; sand-stone, 3; phonolites, 1.

Baron Poisson, the eminent mathematician, President of the Academy of Sciences, and peer of France, died at Sceaux, on the 25th of April, aged fifty-eight, after a long and painful illness. He has left four sons.—M. Jullien Desjardins, founder of the Society of Natural History at the Mauritius, and a distinguished naturalist, died a short time since, aged forty.

It is announced, in a semi-official manner, that the new chair of the Slavic languages and literature, just founded at the Collège de France, is intended for the eminent Polish poet Mickiewicz, whose nomination to the Professorship of Latin Literature at Lausanne was lately mentioned.

**Books.**—The third and fourth volumes of De Tocqueville's "America" are just out, completing the second part of the work. The author dwells much in them on democracy, as influencing family and social relations.—M. Von Rommel, librarian at Cassel, has just published at Paris a curious inedited correspondence of Henry IV. of France with the learned

Maurice, landgrave of Hesse. The letters do the monarch, both as a man and a sovereign, great credit.—A French translation of Berzelius's "Treatise on Mineral, Vegetable, and Animal Chemistry" has been sent out by Didot: it will be of great use to the French chemists.

*Sciarada.*

Tollera il mio premier sul capo stabile  
Il peso enorme del gran mondo tutto  
Specchia nell' altro un garzoncello amabile.  
A Meropè l'inter-die affanni e lutto.  
Answer to the last:—Timo-re.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, April 18.—The last day of Term, the following degrees were conferred:—

*Masters of Arts.*—The Hon. R. W. West, Balliol College; W. Miller, New College, Esquire Bachelors of Law.  
*Bachelors of Arts.*—W. Shillito, University College.

##### ROYAL SOCIETY.

THE meetings were resumed on Thursday evening, after the Easter recess. The Marquess of Northampton in the chair.—The most noble the chairman, in a becoming address, proposed for ballot H. R. H. Prince Albert. The ballot-box was carried round, and the Prince was elected a fellow amidst acclamation. Lord Lyttleton, being a peer, was proposed, balloted for, and elected.—A letter from the Lords Commissioners of the Admiralty to the President was read; it accompanied a series of magnetic observations made by the expedition under the command of Capt. James C. Ross. The magnetic dip was made by various needles on shore and aboard the Erebus and Terror; they are so recent as the 31st December last. The results are given in a tabular form.—Read, likewise, a postscript to Major Sabine's papers 'On Magnetic Science.' The experiments here alluded to were made by Fox's needles; the signals on board two distant ships were made at the moment of the magnetic dip with perfect exactness.—Read, also, 'A few Remarks on a Rain-table and Map,' by Mr. Atkinson, communicated by Dr. Roget. The observations contained in this paper were taken at various places in England and Scotland; Derby, for instance, and Elgin, Bedford, Birmingham, Carlisle, Keswick, Hereford, Norwich, Swansea, &c. The author only found any thing like uniformity in the quantity of rain falling in that locality called "the backbone of England." He adds, that mostly all our rain comes from the Atlantic. In some places, the fall of rain in a year was 67 inches; in others, 54, 30, &c.; at Carlisle it was thrice as much as in some other places, and at Keswick it was twice as much; at Hereford it was 27 inches in a year; at Birmingham, 26; at Bedford and Norwich, 25 inches each: but this acquiescence cannot be accounted for. Attention was then called to a paper giving a description of the late Mr. Kater's Astronomical Clock, drawn up by his son, and communicated by Sir John Herschel.

##### ROYAL SOCIETY OF LITERATURE.

ON Thursday the General Anniversary of the Society was held, at its house in St. Martin's Place, the Right Honourable the Earl of Ripon, President, in the chair.—According to the directions of the charter, the election of President, Vice-Presidents, and Council, took place, when the following names were declared by the Rev. Mr. Baber and Mr. Decimus Burton, the Scrutators, to have been unanimously agreed upon:—

*President.*—The Right Hon. the Earl of Ripon.  
*Vice-Presidents.*—His Grace the Duke of Rutland; His Grace the Duke of Newcastle; His Grace the Duke

of Sutherland; the Right Hon. the Earl of Clare; the Right Hon. Lord Bexley; the Right Hon. Sir Gore Ouseley, Bart; Henry Hallam, Esq.; William Martin Leake, Esq.; Louis Hayes Petit, Esq.; the Rev. John Hume Spry, D.D.

*Council.*—The Most Noble the Marquess of Northampton; the Right Hon. the Earl of Munster; the Right Hon. Lord Prudhoe; the Right Hon. Lord Colborne; Sir Thomas D. Acland, Bart. M.P.; the Rev. Richard Cattermole (Secretary); the Very Rev. the Dean of Chester; the Rev. Henry Clissold; Sir John Dorrat; Isaac L. Gosholtz, Esq.; William R. Hamilton, Esq. (Librarian and Foreign Secretary); Henry Holland, Esq.; William Jordan, Esq.; David Poole, Esq.; The Rev. George Tomlinson; William Tooke, Esq. (Treasurer).

*Auditors.*—Newell Connop, Esq.; John Morice, Esq. Clerk and Collector.—Mr. Nathaniel Hill.

At this period of the week we cannot go into the details of the meeting. The Secretary read minutes of the proceedings of the last Anniversary, which were confirmed; and also a report from the Council of the transactions of the past year, which was of a satisfactory nature. The noble President then read an eloquent address, in which he adverted to the admission of Prince Albert as an honorary member, and of other distinguished foreign scholars, who had in like manner been added to the strength of the Society. As we trust to be able to present our readers with this paper in a more perfect form, we shall not injure it now by a mere description. Thanks were voted to the Chairman and the meeting adjourned.

##### SOCIETY OF ANTIQUARIES.

MR. HAMILTON, V.P., in the chair.—Mr. Haggard presented to the Museum of the Society a sacrificial instrument, the use of which cannot now be clearly ascertained, found in one of the ancient tombs of Etruria. This being the first present to the Museum since its establishment was received with much applause.—Mr. Gage Rokewode exhibited some ornaments of gold, consisting of a scarabæus, a very small bell, &c., discovered in a cist, in a pyramid in Nubia.—Mr. C. Roach Smith exhibited several ancient coins, ornaments, bones, teeth, &c., in the possession of Mr. Jackson, of Settle, in Yorkshire, found in some caves situated about two miles from Settle. They were accompanied by a plan of the caves, and a description, by Mr. Jackson.—Mr. Ormerod communicated an account (with a drawing) of a leaden font, supposed to be Saxon, in the church of Tidenham, in the county of Gloucester; and another, exactly similar, in the adjoining parish of Llancut; with notices of remains of ancient roads, and parts of Offa's Dike in those parishes, and near the forest of Dean.

##### LITERARY AND SCIENTIFIC MEETINGS

###### FOR THE ENSUING WEEK.

*Monday.*—Entomological, 8 P.M.; British Architects (Anniversary), 3 P.M.; United Service Institution, 9 P.M.; Medical, 8 P.M.  
*Tuesday.*—Linnæan, 8 P.M.; Horticultural, 3 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
*Wednesday.*—Society of Arts, 7 P.M.  
*Thursday.*—Royal, 8 P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.  
*Friday.*—Astronomical, 8 P.M.; Royal Institution, 8 P.M.  
*Saturday.*—Asiatic (Anniversary), 1 P.M.

##### FINE ARTS.

###### SOCIETY OF PAINTERS IN WATER-COLOURS.

THE Exhibition of this Society opened to the public on Monday last. For the thirty-sixth time it displays a selection of original works in water-colours far beyond what can be produced in any other country in Europe, although from the skill and progressive practice

\* The names not in italics, re-elected; those in italics, elected in the room of the Earl of Durham, Bishop of Winchester, Lord Carrington, Dr. Bostock, Mr. Hudson Gurney, and Mr. J. Morice, six members out by rotation.

of the members of this Society has emanated a general knowledge of the nature of colour, vehicle, and execution in this peculiar art, which, forty years ago, no one could have anticipated. We commence our remarks with

117. *Morning*, J. D. Harding; and with little fear that any one will say we have not made a good beginning. The life and brilliancy thrown into this performance speak a language alike intelligible to the uninitiated and to the practised in art. Poetical in its conception, classical in its composition, it owes little to the suggestions in the quotation from Byron, applicable as that quotation nevertheless is to the character of the subject. It is only the taste and skill of the artist that could embody such a scene.

133. *Lady and Mandolin*. W. H. Hunt.—The battle of colours and the bravura in art have been fought and played for almost any time that we can remember since the establishment of our annual exhibitions—oil and water; but for the determined and positive in crimson and gold, we think the prize must be adjudged to Mr. Hunt. What is most remarkable is, that there does not appear any thing violent or crude in the display of the rich furniture to which this gorgeousness is confined. As to the lady, her face is turned from the spectator, and whether it be beautiful or otherwise, picture saith not. Gallantry compels us to believe the former.

140. *Room at Knowle, Kent, Seat of Earl Anherst*. Joseph Nash.—If, amidst so much varied excellence, the present Exhibition has any one leading feature, we should be inclined to say it is in interiors of the olden times—like this example, in which the grand, the ornamental, and the chivalric, are so finely combined. What is not seen is implied; for, if Mr. Nash's authority may be depended on, even children's toys were, in those days, tilting knights, made to run on wheels in combat against each other. We need hardly say, that in every part of his picture the artist is master of his subject; and in the effect of light, and in the character of the female (the only figure introduced), he has awakened an interest which might suggest tale or legend to the pen of the writer in prose or in verse.

149. *The Morning of the Chase*. Frederick Tayler.—Here we are again in the olden time: the baronial hall, with a portion of its exterior and imposing grandeur, ladies on horseback, attendants in waiting, grooms and helpers in their several employments, with knights and squires, principal and subordinate, together with hawks and hounds, fill up the inspiring scene—a scene which Wouvermans might be proud to own for its character and composition. This performance (as it well deserves to do) occupies the centre of the best side of the room.

165. *A Hard Word*. W. Hunt.—It would be a hard case if we did not meet with the quiet comedy of Art from this gifted artist's pencil. This production, and 7, *The Pozzer*, as a pair, are well suited to display his powers: the first is illustrated by a boy over his book; the second, with the slate and the sum: both are admirable in truth and expression.

209. *Will Honeycomb's Dream*. Mrs. Seyffarth.—A subject well suited to the talents and pencil of the fair artist, affording an opportunity of shewing the splendour of dress of our great-grandmothers in its most vivid colours, and redolent of the action and character belonging to the period in which they fluttered. The taste and skill of Mrs. Seyffarth are especially seen in her principal groups—that of

the female with her lapdog, and of the mother with her infant; these are brought into juxtaposition, and display the powers of contrast with the best effect imaginable.

233. *Columbus before the Council at Salamanca*. J. Stephanoff.—The event of the circumstances under which it took place are described in the spirited language of the quotation from Washington Irving; a passage which has been followed by the artist with good effect in the mien and expression of the principal figure, the animated and inspired Columbus. Such a scene well deserves to be perpetuated; it is a lesson to posterity, and will, we trust, to the latest period, continue to influence the conduct of governments in their treatment of enterprising heroism.

300. *Guardian Angels*. J. M. Wright.—Those who are acquainted with the productions of this truly gifted and versatile artist only in the departments of comedy, farce, and the humorous of art, will find it difficult to believe that this beautiful and tasteful group has proceeded from the same mind: but so it is, and it is hard to say in which style Mr. Wright most excels. The subject under notice, with very little alteration, would make an altarpiece calculated to arouse the purest and most affectionate emotions of Christian piety.

240. *Portia*, J. W. Wright; and 275. —, F. Stone.—We have brought these pictures together in our notice, as both relate to matrimony, and as in both the subjects are under the influence of regrets and uncertainty. The first is from the "Merchant of Venice," the last from the lines of an old ballad:—

"Nobody coming to marry me,  
Nobody coming to woo."

Each of these interesting females is of the first order of beauty, and in the best style of art. Of the first, we know the fate; of the last, we can only say that the man must be made of Stone that would not "woo" such a damsel if he had the opportunity.

[To be continued.]

#### NEW SOCIETY OF PAINTERS IN WATER-COLOURS. [Fourth Notice.]

83. *Boy's Diversion*—"Pitch and Toss." 240. *Boy's Diversion*—"Heads or Tails." Aaron Penley.—It sometimes serves our purpose, and we think also that of the painter, to bring his performances thus into juxtaposition. To the subjects under these titles we are happy to say Mr. Penley has given an interest, as well in expression as in the carefully executed study of his models, to which he has imparted an earnest seriousness in action and gesture that might well suit higher diversions (to some) of a more exciting character.

54. *The Errand Cart*. E. Duncan.—A sun-lit snow piece, than which we never saw a more perfect or faithful example from the pencil of any artist, French or English. We hardly thought it possible to give to such a subject the variety of tint and hue that may be found in this simple scene.

10. *Cintra, Portugal*. W. Telbin.—A view which owes little or nothing to the variety of tints or colours of foliage, sky, and ground, which may at some periods decorate it, but which is highly interesting from the spirited style of execution, and the tone of harmony that pervades the whole.

21. *The Farmer*. G. H. Laporte.—We give the quotation, of which the drawing is an admirable illustration:—

Unceasing industry he kept in view,  
And never lacked a job for Gies to do.

*Farmer's Boy.*

Both men and cattle are executed in a style that may well recommend the performance.

50. *Squally Morning*:—*Mist clearing off*. Thomas S. Robins.—We are well aware that both land and water to a certain degree partake of the colour of the surrounding atmosphere, and this may account for the flush and tint that pervade the picture. But be that as it may, the action of the waves, the riding and trim of the vessels, and their skillful delineation, shew the hand of a master.

6. *Married*. 120. *Single*. 136. "*Happy, Happy Pair*." John Absolon.—The first two of these clever works, although erroneously arranged, illustrate, as their titles import, the conditions of single and married life. Each is exhibited with its appropriate joys and comforts, and in each is seen the favourable side of the picture. Lest, however, we should doubt which way the artist inclines, the third performance is conclusive on that point; but it is smaller and less finished than the others; and seems rather like the echo of a voice, than the full utterance that should be given in matters of such importance. The series reminds us of an old and favourite toast, in the days when toasts and sentiments were in vogue,—

May the single be married, and the married happy.

150. — Fanny Corboux.—Here is no title, but a quotation from the late Mrs. Hemans:—

The stranger's heart is with her own.

Happy must that stranger be, if the heart of the female so beautifully represented is in accordance with the outward and visible sign of her countenance.

67. *Raphael shewing his Designs to his Patrons, Johanna, Duchess of Sorre, and Guidubaldo, Duke of Urbino*. Benjamin R. Green.—A quotation explains particulars of the subject; and we have only to observe that those were the palmy days of art, and that Mr. Green has illustrated the occurrence with taste, and his usual soft and fluent style of execution.

48. *Vase of Flowers*. M. Harrison.—A more beautiful display of the produce of the flower-garden we have seldom seen, or one with more of breadth in effect and delicacy in texture; as a whole possessing the highest qualities in art, with the exception of the statues in the background, which interfere with the principal objects.

140. *An Indian Cottage, from a Sketch by Lieutenant Frederick Pollock, Royal Madras Engineers*. James Fahey.—A subject well suited to the amenity of the artist's pencil. Mr. Fahey's scenes of English cottagers and their rustic inhabitants are all of the amiable and simple in their kind; and such is the character of the present view.

[To be continued.]

#### WELLINGTON NATIONAL MEMORIAL.

WE have been gratified with a private view of the colossal bust of his grace the Duke of Wellington, modelled by Mr. M. C. Wyatt, in preparing for the Equestrian Statue of his grace to be placed on the arch of entrance to the royal palace at Hyde Park Corner.

The bust, we understand, has been submitted to the inspection of the committee, and to a number of the most intimate friends of the illustrious captain, by every one of whom it has been pronounced to be a singularly successful resemblance of the hero. It is entirely of the character of the antique, and when viewed somewhat in profile, assumes the grand appearance of a Roman head. The scale is for a figure of eighteen feet in height, and that of the horse

will be of the same proportion, making the entire group in this vast design of the altitude of more than twenty-two feet, clear of the plinth on which it will be placed. The whole will be cast in bronze, in the furnaces now erecting under the direction of the distinguished sculptor to whom this arduous task has been confided. Mr. Wyatt has just completed his new spacious studio, which is thirty-two feet in height within, and, being contrived with a broad light, will illuminate the group, which will turn on a pivot moving a circle of some twenty feet in diameter, so that every part will be distinctly visible during its progress from the beginning to the completion. The impression of the head now finished in the model is magnificent.

## NEW PUBLICATIONS.

*The Prodigal's Return.* Painted by E. Prentiss; Engraved by J. Scott. Ackermann and Co.

FROM the time at which we first saw it in the Exhibition of British Artists, we have always considered this as one of Mr. Prentiss's most able and interesting works. It is the scriptural story judiciously modernised. The emotions of the various actors in the domestic drama, the utter prostration of the penitent, the irresistible yearnings of the mother's tender heart, the slowly-yielding implacability of the father, the affectionate entreaties of the sister, and the anxiety of the old nurse, are all admirably depicted. Mr. Scott has done himself great credit by the manner in which he has engraved this beautiful and impressive composition.

*Views in the Department of the Isère and the High Alps.* Lithographed by Louis Haghe, from Sketches by the Right Hon. Lord Monson. Dalton.

It is very pleasing, and the more so on account of the rarity of the occurrence, to see a man of rank, property, and influence, not only amusing himself with his pencil, but submitting his productions to the observation and criticism of the public. With honourable candour, Lord Monson declares, in his Introduction, that these drawings "owe their sole merit to the incomparable skill and ability, in their transfer to the stone, of that accomplished artist Mr. Louis Haghe." No doubt they have derived the greatest advantage, in every respect, from having passed through the masterly hands of Mr. Haghe, at whose surpassing talents, and at whose indomitable industry, we are equally, and every day more and more, astonished; but, after making every just and fair allowance on that account, it is evident, were it simply from his choice of subjects, and of their points of view, that the noble lord has educated his eye to a very discriminating appreciation of the picturesque, both in form and in effect. However all that may be, the happy result is the publication of a series of the most charming lithographic drawings conceivable. They are twenty-two in number; are chiefly intended to illustrate "The Memoir of Felix Neff, by Dr. Gilly;" and comprehend a variety of scenes of contrasted beauty, sublimity, fertility, and desolation, the interest of which is greatly increased by Lord Monson's accompanying narrative (in French and English) of the memorable events of which those scenes were the localities.

*Illustrations of the New Testament.* By Frank Howard, Esq. Darton and Clark. THIRTEEN compositions, designed on stone, and intended for the use of schools and

domestic instruction; with texts and references to adapt them to a regular series of lessons in Scripture history. Although Mr. Howard does not seem to be perfectly familiar with lithographic materials, he is sufficiently so to communicate great expression and spirit to his drawings. Several of them,—for instance, "The Sermon on the Mount," "The Wise Men from the East," "Little Children brought to Christ," "The Last Supper," and others, if, after the parts had been carefully studied from nature, they were painted, of the size of life, would make admirable altar-pieces. How is it that it does not occur to some of our noble and opulent connoisseurs, who talk of their disposition to cherish and encourage native talent, to give a few orders of that description? Surely the clergy of the present day, whatever they might have been in the times of Reynolds and Barry, are too intelligent to decline the acceptance of such works.

*Lithographic Views of Military Operations in Canada, under His Excellency Sir John Colborne, G.C.B. &c., during the late Insurrection.* From Sketches by Lord Charles Beauclerk, Captain Royal Regiment. Accompanied by Notes, Historical and Descriptive. Flint.

WITHOUT advancing any pretensions to distinction as works of art, these views convey a very clear and intelligible idea of the operations in question; and their interest is much increased by the historical and descriptive notes.

*Heath's Waverley Gallery of the Principal Female Characters in Sir Walter Scott's Romances and Poems.* From Original Paintings by eminent Artists. Part I. Tilt. THE volumes of Scott furnish inexhaustible materials for the pencil of the artist. The present publication is to consist of twelve parts, each containing three engravings. Our favourite in the part under our notice is "Alice Lee," engraved by H. Robinson, from a drawing by J. W. Wright.

## ORIGINAL POETRY.

## MODERN ROMANCE OF MATRIMONIAL SPECULATIONS.

JEMIMA, love, just close the door,  
I've fifty things to do and recollect  
Be serious, dear, and recollect  
You're twenty-three to-day.  
Now, though I do not blame you for 't,  
I never thought to see  
Jemima Tompkins spiffster still,  
So late as twenty-three.  
Sir Harry Jones—I always thought  
You would be Lady J.;  
It was extremely singular  
You let him get away.  
Then Mr. Edwin Smith was warm—  
A fortnight at the least;  
He danced with you, and talked with you,  
But there the matter ceased.  
And now there's Captain Stevenson,  
His figure is most striking—  
Examine him next time you wait,  
I'm confident you'll like him.  
His father is a baronet,  
And he's the eldest son;  
He likes you—so, if you like him,  
The business will be done.  
The captain is a bold young man,  
And, maybe, never woo'd,  
So, pr'ythee, if he kisses you,  
Jemima, don't be rude.  
Of course you need not kiss again,  
For modesty has charms;  
You'd best contrive to faint away,  
But do it—in his arms.  
But don't be long in coming to,—  
And do it gently then;  
Perhaps you may encourage him  
To come and kiss again.  
Come,—you and I must practise this,  
For every body knows,  
It is a very useful plan  
To make the men propose.

Hark!—is not that the captain's knock?  
His cab is at the door.  
There, pr'ythee don't be flurried, love,—  
What would you wish for more?  
Sit in a pretty attitude—  
There's your canary,—feed it,—  
Or, stop—I know he loves Petrarch—  
Here's "Dobson's Memoir,"—read it.

S8602.

## THE BRIDE'S FATHER.

THE last kiss is given,—the last adieu sighed,—  
The bridegroom's away with his beautiful bride;  
Alone sits the father,—alone in his years,—  
The mansion is silent,—the old man in tears!—  
He thinks of her sweetness which soothed every care,  
And he fondly looks up as expecting her there!—  
Ah, when was the time he such sorrow had shewn,  
And she came not?—but now the old man weeps alone!  
And could she remember his fondness that threw  
Fresh flowers o'er her path every moment she knew;  
That granted each wish her light heart could prefer,  
Who in the wide world had but her—only her!  
Oh! Nature, how strange and unfeeling appears  
This breaking of all the affections of years,  
For one, who a summer ago was unknown!  
Yet that one has her heart!—the old man weeps alone.  
No, not for a crown,—as an emperor's bride,—  
Had I quitted a father's affectionate side;  
I'd thought on his evenings long, lonely, and dim,  
And prized not a love unconnected with him,  
Deem'd the one who'd have soothed not my father's decline—  
How'er he might love me—unworthy of mine!  
Nor changed the affections 'neath which I had grown,  
Nor left a fond father, old, cheerless, and lone!

C. SWAIN.

## THE DRAMA.

*Italian Opera.*—Thursday night was signalised after the opera of the *Puritani* (sweetly sung by Grisi, Rubini, and Lablache), by the occurrence of an O. P.-ra row, which lasted till past one o'clock, and prevented a single step of the ballet or the new dancer, Madame Cerito, from being executed. The cry of the audience, headed by persons of high rank, was for the engagement of Tamburini; the subscribers being of opinion, that where the highest prices are extorted from them, the highest talent ought to be engaged to amuse them. To this Mr. Laporte (or rather, the parties behind the curtain who speculate in the Opera House, and whose representative he is) demurred, and half-a-dozen attempts were made to speechify and shuffle the public out of this just demand. But they would not endure the further encroachment, after the many that have been suffered; and the contest was continued till the curtain dropped, with a fair prospect of its being renewed with aggravated force and fury to-night. Indeed, when we consider the great profits, pretty well known to have been on the opera of last year, it does seem most shabby treatment of liberal supporters to retrench their pleasures in almost every possible way. Except F. Elssler, there has been no ballet, and this is May. The prices are raised, the entertainments lessened, and the number of nights limited. This would not be tolerated in any city in Europe, except in London, where the drama has been so long trodden down in every branch that we have got quite accustomed to ill usage, and like it as the eels like being skinned. The Opera managers, however, now that they are not only plumply pitted but firmly boxed, must yield to the general voice, or they will find reason to repent of their greed and obstinacy. It was ludicrous, but very tiresome, to see the *corps de ballet* for an hour and a half on the stage in their fantastic garbs, each individual,

"Apollo and the rest,"

looking like Patience on a monument, and waiting for the periodical return of Laporte to endeavour to evade the question. But nothing would do, and nothing was done.

Covent Garden.—On Tuesday, *Love in a*

*Village* was produced here, with a good cast, and well-dressed. Farren, Harrison, Fraser, Keeley, Mrs. C. Jones, and Miss Rainforth, supported the principal parts. The theatre, we are told, will shut about June 1.

On Thursday, the *Merry Wives of Windsor* was played with Mr. Bartley as *Falstaff*, and the dresses of the period of Queen Elizabeth, which appears to be rather anomalous. They were, however, very effective on the scene where her majesty's royal ancestry fought; and the two merry wives got through merrily. Some songs were introduced, as has been the custom heretofore, and though very agreeable in themselves, the custom is more honoured in the breach than in the observance.

At the *Haymarket* we have only to record continued and deserved success, and that our old friend Fitzwilliam has issued a bill of unusual attractions for his annual benefit on Monday next.

*Olympic*.—On Monday, and during the week, a laughable absurdity has been played with success. It is a sequel to the popular *Ladies' Club*, and entitled *The House of Ladies*. Fancy, indulged by Time, gets a peep at 1845, when the country is under petticoat government; and the dames who managed the husbands so well in the previous piece have extended their influence to managing the country, and become members of parliament, racers, gamblers, &c. &c.—in short, all that men are now. In the end, however, they break their charter by disagreement among themselves upon the rouge-taupe question, and some innuendo about ages, and return to their old position as the piece concludes. There is a good deal of fun in it, particularly in the *ad libitum* dressing. No doubt it will keep its place till the dissolution of the house—in Wych Street.

*The Prince's Theatre*.—The German operatic company opened on Monday, with the *Frey-schütz*; and we hear that, together with several good singers, and a band well disciplined to play in concert, there is so sad a poverty in the getting up and *ensemble*, that it is not likely these performances will become very popular in London.

#### VARIETIES.

*The Art-Union*.—At the annual meeting in Mr. Rainy's rooms, in Regent Street, on Monday, we were so distant from the platform proceedings, that we could not make out the details. The Marquess of Northampton presided, and apparently a very satisfactory report was read, from which we gathered that the number of subscribers had risen to nearly 2000, and the amount of subscription to about 2250*l*. Some unimportant discussion ensued as to the mode of drawing the prizes, &c.; and, finally, the lottery for the year was submitted to the blind goddess (represented on this occasion by a young lady with very good eyes), and thanks having been voted to this fair dame for the trouble she had taken; to Mr. Rainy, for the use of his spacious gallery; and to the noble chairman for his judicious presidency, the meeting separated.

*Photography*.—Professor Dr. Berres has, after a series of experiments, discovered not only a way to fix for ever the heliographic or photographic images, delineated by means of the daguerrotype, on the prepared silver plate, but likewise an extremely simple method by which impressions of them may be taken. The new discovery is of incalculable importance to the arts, for by this means an object may be taken, fixed, and prepared for printing, in one hour's time. Dr. Berres will shortly publish an account of his discovery.—*From Vienna*.

*St. Petersburg, 14th April*.—Both Russian and foreign periodicals have frequently spoken of the interesting experiments of Professor Jacobi, to apply electro-magnetism as a moving power: his discovery of a means to obtain metallic impressions is likewise generally known. The galvano-plastic method, as he calls it, which dissolves the copper by a galvanic current, fixes it on different bodies, and forms models or casts of all possible productions of the arts, of engravings, &c. with such accuracy as cannot be attained in any other manner. He has applied for a patent for ten years, presenting a detailed description with the necessary drawings. The Board of Manufactures has decided that he is fully entitled to such a patent. But the Minister of Finance, who had already had an opportunity of applying the process of Professor Jacobi with great success in an imperial institution, being convinced of its great importance to the arts, has, after consulting Professor Jacobi, suggested to his majesty the emperor whether it might not be better to grant the discoverer, instead of a patent, the sum of 25,000 silver roubles, as a recompense for the service he had rendered to the sciences, arts, &c., on condition of his publishing a detailed account of his discovery, with the necessary drawings to illustrate it. His majesty has approved of this suggestion, and ordered the above sum to be paid to M. Jacobi. The account of his discovery, with all the present applications of it, will be shortly printed, and all the applications of it which M. Jacobi may make in future will also be published.

*Antiquities*.—On Tuesday last another of those interesting Roman remains, the Bartlow Hills, was explored under the direction of their noble proprietor, Lord Maynard, and afforded the usual rich treat to antiquarian research. A variety of beautiful sepulchral remains, some in fine preservation, were found, the particulars and descriptions of which we are promised next week. Lord and Lady Braybrooke with a large party, Professors Sedgwick, Henslow, and Whewell, and a large assemblage of ladies, were present on this interesting occasion.—*Cambridge Chronicle*.

*Sir R. Seppings*.—This distinguished naval architect died on the 25th, at a good old age. Many important improvements in the construction of vessels are due to his genius and indefatigable exertions.

*Portrait of Prince Albert*.—We are glad to hear that Prince Albert has become the proprietor of Minasi's pen-and-ink portrait of his royal highness, of which we spoke so favourably in a late *Literary Gazette*.

*King's College*.—At the Annual Meeting on Thursday a very favourable report was made of the flourishing condition of this excellent establishment.

*Skating*.—Notwithstanding the summer weather, we are told that a party of amateur skaters had a meeting on Monday, and exercised their graceful art on a piece of water sufficiently extensive, and frozen by artificial means.

SWEET Poesy, who cheereth many a one,  
Hath many shapes. To him whose death is nigh—  
Hoar age—who sorroweth for youth gone by,  
She is a fair-haired infant. To the lone  
And sadden'd hermit, who with man hath done,  
She is a bird, whose constant melody  
Teacheth him love and wisdom. To the eye  
Of eager youth she seemeth as his own  
Sweet love—her face his chosen, most prized book,  
And ever cometh she for good. The light  
Is she that glideth all things—the clear brook  
Feeding thought's flowers—the brightest of the bright  
Among the throned stars, to which men look  
To find their fate among the gloom of night.—D. O. H.

#### Epitaph in Penhurst Church, Kent.

Here lyeth Wylm Darknelle Pson of this Place  
endure his Ministeri even this day of Grace  
his Father and Mother, and Wyves 2 by name  
80 84 46 60  
John Jones and 3 Margarets all lived in good fame  
thirte several ages who lyeth to knowe  
over each of their names the figures do shewe  
the somes and Daughters now sprongef of this race  
are Fyve score od in every place.

#### LITERARY NOVELTIES.

Mr. B. E. Pote announces immediately the "Shepherd Kings,—time of the Exodus, and Concordance of Manetho with Herodotus and Diodorus;" the delay in publication having arisen from the destruction of the original papers for the work.

#### LIST OF NEW BOOKS.

A Treatise on Shells and Shell-Fish, by W. Swainson, F.R.S., &c. fcap. 6s.—The Rural Life of England, by W. Howitt, Esq. 2d edition, 1 vol. 8vo. 91s.—Dictionary of the Art of Printing, by W. Savage, No. 1. 8vo. 1s. 6d.—Illustrated Biblical Chart of the Worship of God. 8vo. 6s.; or coloured, 10s.—Penmanship for Young Ladies: Letters in French, English, and Italian, 4to. 5s.—The Schoolboy's Holiday Companion, by T. Kentish, 16mo. 1s. 6d.—Sketch of Chemistry, Practical and Applied, by J. Murray, fcap. 7s. 6d.—The Hieroglyphics of Harappo Nilous, by A. T. Cory, post 8vo. 7s. 6d.—Poems, chiefly Dramatic, edited by T. Hill Lowe, 12mo. 6s.—The History of the Holy War, by T. Fuller, new edition, fcap. 6s.—Illustrations of the Doctrine of the Church of England, fcap. 5s.—Godson, the Law of Patents, 2d edition, 8vo. 16s.—Bishop Cosin's History of Popish Transubstantiation, new edition, by the Rev. J. Brewer, 12mo. 6s.—Knox's Liturgy of the Church of Scotland, new edition, by the Rev. J. Cumming, 12mo. 5s.—Robinson Crusoe, illustrated by Grandville, 8vo. 15s.—Ingliston, by Grace Webster, post 8vo. 11s. 6d.—Bentham's Works, Part XIV., 8vo. 9s.—Lessons in Geography, by Mrs. J. Slater, 12mo. 6s.—Divine Breathings, 32mo. 1s.—The Sportsman in Ireland and Scotland, 2 vols. post 8vo. 18s.—The Interdict, a Novel, 3 vols. post 8vo. 1*l*. 11s. 6d.—Essays on the Church, new edition, fcap. 5s.—The School-Girl in France, a Narrative addressed to Christian Parents, fcap. 6s.—Jardine's Naturalist's Library, Vol. XXVII.: Fishes, 6s.—Review of Lord Brougham's Translation of Demosthenes on the Crown, post 8vo. 7s. 6d.—Tweddle's Library of Medicine, Vol. 11. 10s. 6d.—Humble's Bible Questions, 3d edition, 12mo. 4s. 6d.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

W. P.'s "Ode to Spring" has some novel ideas, but we have not room, though she does come in a heavenly garment.

"Of budded beauty—bleach'd by the airs  
Of tranquil moonlight,"

and with

"a band  
Of network woven to conceal her eye,"

We are reluctantly obliged to postpone our sixth letter on the Exhibition at the Louvre, our Geological report, and one or two other articles intended for this *Gazette*.

Mr. Spencer, by referring to *Lit. Gaz.* No. 1203, will find that our report of the proceedings of the Royal Institution explicitly states the period of the publication of his pamphlet, and directs attention to the original views and experiments therein contained. We commend Mr. Spencer for his generous spirit in regard to a patent for his invention, and congratulate him upon the successful application of voltaic agency to practical gliding, silvering, platinising, &c., an account of which, together with that of any improvements in the process, we should be happy to receive. The brown-paper diaphragms have been already noticed in our columns.

"Jock o' Hazeldean" we never heard a doubt of being written by Sir Walter Scott.

We have again to repeat that few matters sent so late as Thursday can be attended to, and we are surprised at the disregard of this intimation (so often given) by old correspondents and publishers. Dr. Van Oreen's letter on the persecution of the Jews is of no avail this week, in consequence of having been delayed till Friday morning.

**TO LITERARY CAPITALISTS.**—Any Gentleman whose attention has been devoted to General Literature may possess himself of an important and interesting Literary Property, identified with the National Literature, and now ranking with the oldest standard Periodicals of the day, yielding an income amply sufficient to reward the person whose sole attention may be devoted to it. Apply, prepaid, N.Y. care of Mr. Lewis, 185 Fleet Street.

**TO BE SOLD—THE LITERARY GAZETTE.** Complete from its Commencement in 1817 to 1830, all clean, and half bound in calf, neat, 18 vols, only 4s. 4s. The early part of this valuable Journal is now becoming very scarce.—The above has also a Catalogue of Ancient and Modern Books, with their Prices, published Gratis every Month. May be had of G. Willis, 37 Princes Street, Leicester Square.

**INDIA, PERSIA, and CAUBUL.**—WYLD'S MAP of all the COUNTRIES lying between TURKEY and BURMAH; comprising Asia Minor, Persia, and Arabia, and including the Black, Caspian, and Red Seas, particularly constructed to show the overland route to India, and the relative position of Russia to the Anglo-Indian possessions, with Enlarged Plans of the Dardanelles and Bosphorus. Four Sheets, 11s.; Case, 17. 10s.

Map of India, constructed with great care and research from the latest authorities, and intended more particularly to facilitate a reference to the Civil and Military Stations, with a Polymetrical Table of Reciprocal Distances. One large Sheet, 15s.; Case, 17.

An Index to Wyld's Map of India, containing the Names of many Thousand Places, with their Latitude and Longitude, 8vo. 10s.  
 Published by James Wyld, Geographer to the Queen, Charing Cross East, four doors from Trafalgar Square, London.

**AT A MEETING OF THE BOARD OF DEPUTIES OF THE BRITISH JEWS, and others, held at the residence of Sir Moses Montefiore, Grosvenor Gate, Park Lane, on Tuesday Evening, the 21st April instant,**

Present.  
 Joseph Gutterer Henriques, Esq. President.  
 Baron De Rothschild  
 Messrs. Moses Mocatta  
 I. L. Goldsmid, F.R.S.  
 Jacob Montefiore  
 Isaac Cohen  
 Henry H. Cohen  
 Samuel Benussan  
 Dr. Lowe  
 Louis Lucas  
 A. A. Goldsmid  
 Louis Cohen  
 H. De Castro  
 Haim Guedalla  
 Sir Moses Montefiore, F.R.S.  
 Messrs. Simon Samuel  
 Hyam Hyams  
 Joel Data  
 David Salomons  
 Abraham Levy  
 Jonas Levy  
 Lawrence Myers  
 Solomon Cohen  
 Bernard Vanover, M.D.  
 S. J. Waley  
 F. H. Goldsmid.

The following Resolutions were unanimously adopted:—  
 That this Meeting has learned, with extreme concern and disgust, that there have been lately revived in the East those false and atrocious charges so frequently brought against the Jews during the middle ages, of committing murder, in order to use the blood of the murdered as an ingredient in the food eaten during the religious ceremonies of Passover; charges which, in those times, repeatedly served as a pretext for the robbery and massacre of persons of the Jewish faith, but which have long disappeared from this part of the world, with the fierce and furious prejudices that gave them birth.

That this Meeting is anxious to express its horror at finding that, on the ground of these abominable calumnies, numbers of Jews have been seized at Damascus and at Rhodes; that many children have been imprisoned, and almost totally deprived of food; that, of the adults seized, several have been tortured till they died, and others have been sentenced to death, and, it is believed, executed, although the only evidence against their guilt was pretended confessions, wrung by torture from their alleged accomplices.

That this Meeting earnestly requests the Governments of England, France, and Austria, to remonstrate with those Governments and to rebuke these atrocities have taken place, against their continuance.

That this Meeting confidently relies on the sympathy and humanity of the British nation to exert its influence and authority to stay such abominable proceedings; and that the President, Joseph Gutterer Henriques, Esq., Isaac Cohen, de Rothschild, de Almon Montefiore, and Messrs. Isaac Lyon Goldsmid, Jacob Montefiore, David Salomons, A. A. Goldsmid, and J. H. Goldsmid, do form a deputation to request a conference on the subject with her Majesty's Secretary of State for Foreign Affairs.

That these Resolutions be sent in the newspapers.  
 J. G. HENRIQUES, President.  
 A letter was read from the Rev. Doctor Hirschel, Chief Rabbi, expressive of his regret that his infirmities prevented his attendance at the Meeting, and declaring his concern at the revival of such false and calumnious assertions, and his horror at such atrocious cruelties.

The Meeting was attended by Monsieur Crémieux, the celebrated French Advocate, and Vice-President of the Consistoire Central des Israélites Français, who addressed the Meeting most eloquently in the French language, expressing his concurrence and sympathy in its proceedings.

**MR. CARLYLE'S LECTURES ON**  
 HEROES, HERO-WORSHIP, and the HEROIC, in HUMAN HISTORY. Six Lectures, to be delivered at 17 Edward Street, Portman Square, at 3 o'clock p.m., on Tuesday, May 5, and the succeeding Tuesdays and Fridays: Lecture I. The Hero as Divinity; Lecture II. as Prophet; Lecture III. as Poet; Lecture IV. as Priest; Lecture V. as Man of Letters; Lecture VI. as King. Subscription to the Course, One Guinea. Syllabus and Tickets to be had of Mr. Fraser, Publisher, 215 Regent Street; and at the Lecture-Room.

**WINDSOR CASTLE, illustrated by the**  
 late Sir JEFFRY WYATVILLE, R.A. F.R.S. &c.  
 Dedicated, by express permission, to Her Majesty the Queen.  
 The First will appear in May, the Second in October, and the concluding Part in January.  
 Proofs ..... 24 14 6 each Part.  
 Prints ..... 8 12 6 each Part.  
 It will be edited (at the request of Sir Jeffry's Son-in-Law and of his Executors) by Henry Ashton, Esq. 50 Brook Street.  
 Published by Mr. Weale, 60 High Holborn.

**SALES BY AUCTION.**  
**The Unrivalled Collection of Prints and Drawings of the late William Esdaile, Esq.**

By Messrs. CHRISTIE and MANSON,  
 At their GREAT ROOM, King Street, St. James's Square,  
 On MONDAY, JUNE 28, and many following Days.

This wonderful Collection, which occupied so many years of tasteless research and the most acute judgment, during the life of that distinguished connoisseur William Esdaile, Esq., will be found to contain the entire Lawrence Collections of Drawings of Titian, Claude, and Rembrandt; besides his own very rich Collection of Specimens of all the Schools, made many years before these great acquisitions. The Prints include almost unique series of the works of M. Antonio, his School, and other Italian Engravers; the matchless assemblage of the works of Rembrandt, and other Dutch Masters, German, French, and English.

Catalogues are being prepared.

**The Prince Poniatowski's Collection of Ancient Drawings, Engravings, a few Pictures, Greek Coins, and Medals.**

By Messrs. CHRISTIE and MANSON,  
 At their GREAT ROOM, King Street, St. James's Square,

"Two stars keep not their motion in one sphere."  
John Oliver, Publisher, 50 Pall Mall. Skelpton.

## MR. COLBURN'S NEW PUBLICATIONS.

NOW READY.

I.  
WOMAN AND HER MASTER.

By LADY MORGAN.

2 vols. post 8vo.

"Lady Morgan has imparted to history the charm of romance. We have read her series of rapid but brilliant and vigorous sketches, with an interest which many a novel fails to excite."—*Weekly Chronicle*.

"Lady Morgan has in these volumes undertaken to investigate one of the most important elements of social science,—the position which woman should occupy, both in the order and progress of society. She has sought in the records of the past, guidance and direction for the future; she has subjected the pages of history to a vigorous moral analysis, testing their facts with the skill of a critic, and deducing results with the wisdom of a philosopher."—*Athenaeum*.

II.  
PRECEPTS AND PRACTICE.

By THEODORE HOOK, Esq.

Author of "Sayings and Doings."

3 vols. post 8vo. with Portrait of Mr. Hook, and numerous Illustrations by Phil.

III.  
THE SPORTSMAN IN IRELAND, AND IN THE HIGHLANDS OF SCOTLAND.

2 vols. post 8vo. with Illustrations, 18s. bound.

IV.  
In 2 vols. 8vo. with Portraits and Autographs.MEMOIRS OF THE PRINCESS DASCHKAW,  
LADY OF HONOUR TO CATHERINE II.

Written by HERSELF.

To which are subjoined, numerous Letters of the Empress Catherine, and other Distinguished Personages.

"The memoirs of a woman who at eighteen headed a revolution, was the cherished companion of Catherine, for twelve years the president of the Academy of Arts and Sciences, who travelled over the principal countries of Europe, and corresponded with its most eminent scholars and statesmen—with Voltaire, Diderot, Robertson, Prince Kaunitz, and Bishop Talleyrand; who exhibited talents for governing and improving mankind equal to those of her imperial mistress; who was banished by Paul and recalled by Alexander; who made the woman-hating Frederick of Prussia stand bareheaded in the presence of his troops, complimenting her for a quarter of an hour; and drew the 'invalid of Fernay' to the supper-table, when his doors were closed against the most illustrious personages and brilliant wits of Europe: the memoirs of a being so versatile and various, and who passed through so many vicissitudes, cannot but be eminently interesting."—*Conservative Journal*.

New ready, in 2 vols. post 8vo.

## Lights and Shades of Military Life.

Edited by Major-General Sir Charles Napier, K.C.B.

"To say nothing of the pathetic narratives, piquant anecdotes, and personal adventures, with which this work abounds, the comments of the editor—sometimes profound, sometimes playful, and always original—will be found fraught with instruction for officers of every rank."—*Sun*.

"This work consists of two distinct narratives, written by two different individuals who served in the armies of France, and whose military recollections are here combined with an introduction and observations by Sir Charles Napier. In literary characteristics, these French writers immeasurably excel our English military authors. The Count De Vigny imparts to his narrative the interest of a romance, and M. Blaze has such a happy talent for the picturesque, that one might suppose he was telling some agreeable, half-historical tale, with the most consummate art of the poet and the artist. M. Blaze's portion of the work is the most sketchy and amusing: crowded with light and sunny traits, and bringing before us so graphic a picture of life in the various vicissitudes of military experience, that it is possessed of a fascination which has rarely before been imparted to such subjects. We like these volumes because they give us fresh views of the soldier's life, and because, written by soldiers, they speak out of the fulness of thought and knowledge."—*Atlas*.

## BURKE'S EXTINGUISHED PEERAGE, NEW AND ENLARGED EDITION.

New ready, in 1 vol. of 800 pages, closely printed in double columns, with an embellished Titlepage, Portrait, &c. 22s. bound.

MR. BURKE'S GENEALOGICAL AND HERALDIC  
Dictionary of the Peerages

Of England, Scotland, and Ireland, Extinct, Dormant, and in Abeyance. A Companion to all other Peerages, comprising—

1. Peerages of England extinct by failure of Issue, Attainder, &c. alphabetically, according to Surnames—2. Baronies by Writ, England: in Abeyance, and still vested probably in existing Heirs—3. Extinct and Abeyant Peerages of England, according to Titles—4. Charters of Freedom—Magna Charta—Charter of Forests—5. Roll of Battle Abbey—6. Peerages of Ireland extinct by failure of Issue, Attainder, &c. alphabetically, according to Surnames—7. Baronies by Writ, Ireland, in Abeyance—8. Peerages of Ireland, Extinct and Abeyant, alphabetically, according to Titles—9. Peerages of Scotland extinct by failure of Issue, Attainder, &c. alphabetically, according to Surnames—10. Extinct Peerages of Scotland, alphabetically, according to Titles.

\*\*\* This Work comprises exclusively the Extinct Peers of Ireland and Scotland, which are now submitted to the public in detail, each article entering fully into the origin and transmission of each respective Title, and bringing the descent down to some existing family, in every case where so desirable and interesting an object could be accomplished.

JUST READY.

### REVIEWS OF NEW BOOKS.

*Goethe's Theory of Colours.* Translated from the German; with Notes by Charles Lock Eastlake, R.A. F.R.S. 8vo. pp. 423. London, 1840. Murray.

"ENGLISH writers (observes the translator in his preface) who have spoken of Goethe's 'Doctrine of Colours,'\* have generally confined their remarks to those parts of the work in which he has undertaken to account for the colours of the prismatic spectrum, and of refraction altogether, on principles different from the received theory of Newton. The less questionable merits of the treatise, consisting of a well-arranged mass of observations and experiments, many of which are important and interesting, have thus been in a great measure overlooked. The translator, aware of the opposition which the theoretical views alluded to have met with, intended at first to make a selection of such of the experiments as seem more directly applicable to the theory and practice of painting. Finding, however, that the alterations this would have involved would have been incompatible with a clear and connected view of the author's statements, he preferred giving the theory itself entire, reflecting, at the same time, that some scientific readers may be curious to hear the author speak for himself even on the points at issue. In reviewing the history and progress of his opinions and researches, Goethe tells us that he first submitted his views to the public in two short essays entitled 'Contributions to Optics.' Among the circumstances which he supposes were unfavourable to him on that occasion, he mentions the choice of his title, observing that by a reference to optics he must have appeared to make pretensions to a knowledge of mathematics, a science with which he admits he was very imperfectly acquainted. Another cause to which he attributes the severe treatment he experienced, was his having ventured so openly to question the truth of the established theory: but this last provocation could not be owing to mere inadvertence on his part; indeed the larger work, in which he alludes to these circumstances, is still more remarkable for the violence of his objections to the Newtonian doctrine. There can be no doubt, however, that much of the opposition Goethe met with was to be attributed to the manner as well as to the substance of his statements. Had he contented himself with merely detailing his experiments, and showing their application to the laws of chromatic harmony, leaving it to others to reconcile them as they could with the pre-established system, or even to doubt in consequence the truth of some of the Newtonian conclusions, he would have enjoyed the credit he deserved for the accuracy and the utility of his investigations. As it was, the uncompromising expression of his convictions only exposed him to the resentment or silent neglect of a great portion of the scientific world, so that for a time he could not even obtain a fair hearing for the less objectionable or rather highly valuable communications contained in his book. A specimen of his manner

of alluding to the Newtonian theory will be seen in the preface. It was quite natural that this spirit should call forth a somewhat vindictive feeling, and with it not a little uncandid as well as unsparing criticism. 'The Doctrine of Colours' met with this reception in Germany long before it was noticed in England, where a milder and fairer treatment could hardly be expected, especially at a time when, owing perhaps to the limited intercourse with the continent, German literature was far less popular than it is at present. This last fact, it is true, can be of little importance in the present instance, for although the change of opinion with regard to the genius of an enlightened nation must be acknowledged to be beneficial, it is to be hoped there is no fashion in science; and the translator begs to state, once for all, that in advocating the neglected merits of the 'Doctrine of Colours,' he is far from undertaking to defend its imputed errors. Sufficient time has, however, now elapsed since the publication of this work (in 1810) to allow a calmer and more candid examination of its claims. In this more pleasing task Germany has again for some time led the way, and many scientific investigators have followed up the hints and observations of Goethe with a due acknowledgment of the acuteness of his views. It may require more magnanimity in English scientific readers to do justice to the merits of one who was so open and, in many respects, it is believed, so mistaken an opponent of Newton; but it must be admitted that the statements of Goethe contain more useful principles in all that relates to harmony of colour than any that have been derived from the established doctrine. It is no derogation of the more important truths of the Newtonian theory to say, that the views it contains seldom appear in a form calculated for direct application to the arts. The principle of contrast, so universally exhibited in nature, so apparent in the action and reaction of the eye itself, is scarcely hinted at. The equal pretensions of seven colours, as such, and the fanciful analogies which their assumed proportions could suggest, have rarely found favour with the votaries of taste,—indeed they have long been abandoned even by scientific authorities. And here the translator stops: he is quite aware that the defects which make the Newtonian theory so little available for æsthetic application, are far from invalidating its more important conclusions in the opinion of most scientific men. In carefully abstaining, therefore, from any comparison between the two theories in these latter respects, he may still be permitted to advocate the clearness and fulness of Goethe's experiments. The German philosopher reduces the colours to their origin and simplest elements; he sees and constantly bears in mind, and sometimes ably elucidates, the phenomena of contrast and gradation—two principles which may be said to make up the artist's world, and to constitute the chief elements of beauty. These hints occur mostly in what may be called the scientific part of the work. On the other hand, in the portion expressly devoted to the æsthetic application of the doctrine, the author seems

to have made but an inadequate use of his own principles. In that part of the chapter on chemical colours which relates to the colours of plants and animals, the same genius and originality which are displayed in the 'Essays on Morphology,' and which have secured to Goethe undisputed rank among the investigators of nature, are frequently apparent. But one of the most interesting features of Goethe's theory, although it cannot be a recommendation in a scientific point of view, is, that it contains, undoubtedly with very great improvements, the general doctrine of the ancients and of the Italians at the revival of letters. The translator has endeavoured, in some notes, to point out the connexion between this theory and the practice of the Italian painters. The 'Doctrine of Colours,' as first published in 1810, consists of two volumes in 8vo. and sixteen plates, with descriptions in 4to. It is divided into three parts, a didactic, a controversial, and an historical part; the present translation is confined to the first of these, with such extracts from the other two as seemed necessary, in fairness to the author, to explain some of his statements."

The outline of Goethe's system is, as Mr. Eastlake remarks, to be found in the following paragraphs:—

"The highest degree of light, such as that of the sun, of phosphorus burning in oxygen, is dazzling and colourless: so the light of the fixed stars is for the most part colourless. This light, however, seen through a medium but very slightly thickened, appears to us yellow. If the density of such a medium be increased, or if its volume become greater, we shall see the light gradually assume a yellowish hue, which at last deepens to a ruby colour. If, on the other hand, darkness is seen through a semi-transparent medium, which is itself illumined by a light striking on it, a blue colour appears: this becomes lighter and paler as the density of the medium is increased, but on the contrary appears darker and deeper the more transparent the medium becomes: in the least degree of dimness short of absolute transparency, always supposing a perfectly colourless medium, this deep blue approaches the most beautiful violet."

At this time of day, and with our limited space, it would be absurd to enter into a critical examination of the comparative merits of Newton's and Goethe's theories. But we can assure those of our readers to whom Mr. Eastlake's able and perspicuous translation affords for the first time the means of rendering themselves fully acquainted with the opinions of the German philosopher, that, however widely they may differ on some points from him, they will find much in the volume to gratify and instruct them. Mr. Eastlake's notes also, especially those which are applicable to the practice of the fine arts, are exceedingly valuable and interesting. They are, indeed, such as might have been expected from a highly intelligent man and accomplished artist, who has had ample opportunities of studying the works of all the great masters, and the principles on which those works have been produced. A few extracts will give a taste of their quality.

\* "Farbenlehre"—in the present translation generally rendered 'Theory of Colours.'"

After quoting Fresnoy's lines,  
 "Know first that light displays and shade destroys  
 Refulgent nature's variegated dyes."

Mr. Eastlake says that this notion "is much too positive and unconditional, and is only true when we understand the 'displaying' light to comprehend certain degrees of half or reflected light, and the 'destroying' shade to mean the intensest degree of obscurity. There are degrees of brightness which destroy colour as well as degrees of darkness. In general, colour resides in a mitigated light, but a very little observation shews us that different colours require different degrees of light to display them. Leonardo da Vinci frequently inculcates the general principle above alluded to, but he as frequently qualifies it; for he not only remarks that the highest light may be comparative privation of colour, but observes, with great truth, that some hues are best displayed in their fully illumined parts, some in their reflections, and some in their half-lights; and again, that every colour is most beautiful when lit by reflections from its own surface, or from a hue similar to its own. The Venetians went further than Leonardo in this view and practice; and he seems to allude to them when he criticises certain painters, who, in aiming at clearness and fulness of colour, neglected what, in his eyes, was of superior importance, namely, gradation and force of chiaroscuro. That increase of colour supposes increase of darkness, as so often stated by Goethe, may be granted without difficulty. To what extent, on the other hand, increase of darkness, or rather diminution of light, is accompanied by increase of colour, is a question which has been variously answered by various schools. Examples of the total negation of the principle are not wanting, nor are they confined to the infancy of the art. Instances, again, of the opposite tendency are frequent in Venetian and early Flemish pictures, resembling the augmenting richness of gems, or of stained glass.\* Indeed, it is not impossible that the increase of colour in shade, which is so remarkable in the pictures alluded to, may have been originally suggested by the rich and fascinating effect of stained glass; and the Venetians, in this as in many other respects, may have improved on a hint borrowed from the early German painters, many of whom painted on glass. At all events, the principle of still increasing in colour in certain hues seems to have been adopted in Flanders and in Venice at an early period; while Giorgione, in carrying the style to the most daring extent, still recommended it by corresponding grandeur of treatment in other respects. The same general tendency, except that the technical methods are less transparent, is, however, very striking in some of the painters of the school of Umbria, the instructors or early com-

\* "Absolute opacity, to judge from the older specimens of stained glass, seems to have been considered inadmissible. The window was to admit light, however modified and varied, in the form prescribed by the architect, and that form was to be preserved. This has been unfortunately lost sight of in some modern glass-painting, which, by excluding the light in large masses, and adopting the opacity of pictures (the reverse of the influence above alluded to), has interfered with the architectural symmetry in a manner far from desirable. On the other hand, if we suppose painting at any period to have aimed at the imitation of stained glass, such an imitation must of necessity have led to extreme force; for the painter sets out by substituting a mere white ground for the real light of the sky, and would thus be compelled to subdue every tone accordingly. In such an imitation his colour would soon deepen to its intensest state; indeed, considerable portions of the darker hues would be lost in obscurity. The early Flemish pictures seldom err on the side of a gay superabundance of colour; on the contrary, they are generally remarkable for comparatively cool lights, for extreme depth, and a certain subdued splendour, qualities which would necessarily result from the imitation or influence in question."

panions of Raphael. The influence of these examples, as well as that of Fra Bartolommeo, in Florence, is distinctly to be traced in the works of the great artist just named, but neither is so marked as the effect of his emulation of a Venetian painter at a later period. The glowing colour, sometimes bordering on exaggeration, which Raphael adopted in Rome, is undoubtedly to be attributed to the rivalry of Sebastian del Piombo. This painter, the best of Giorgione's imitators, arrived in Rome, invited by Agostini Chigi, in 1511, and the most powerful of Raphael's frescoes, the Heliodorus and Mass of Bolsena, as well as some portraits in the same style, were painted in the two following years. In the hands of some of Raphael's scholars, again, this extreme warmth was occasionally carried to excess, particularly by Pierino del Vaga, with whom it often degenerated into redness. The representative of the glowing manner in Florence was Fra Bartolommeo, and in the same quality, considered abstractedly, some painters of the school of Ferrara were second to none."

In a subsequent note, Mr. Eastlake states:—"One effect of Goethe's theory has been to invite the attention of scientific men to facts and appearances which had before been unnoticed or unexplained. To the above cases may be added the very common, but very important, fact in painting, that a light warm colour, passed in a semi-transparent state over a dark one, produces a cold, bluish hue, while the operation reversed produces extreme warmth. On the judicious application of both these effects, but especially of the latter, the richness and brilliancy of the best-coloured pictures greatly depends. The principle is to be recognised in the productions of schools apparently opposite in their methods. Thus the practice of leaving the ground, through which a light colour is apparent, as a means of ensuring warmth and depth, is very common among the Dutch and Flemish painters. The Italians, again, who preferred a solid under-painting, speak of internal light as the most fascinating quality in colour. When the ground is entirely covered by solid painting, as in the works of some colourists, the warmest tints in shadows and reflections have been found necessary to represent it. This was the practice of Rembrandt frequently, and of Reynolds universally, but the glow of their general colour is still owing to its being repeatedly or ultimately enriched on the above principle. Lastly, the works of those masters who were accustomed to paint on dark grounds are often heavy and opaque; and even where this influence of the ground was overcome, the effects of time must be constantly diminishing the warmth of their colouring as the surface becomes rubbed and the dark ground more apparent through it. The practice of painting on dark grounds was intended by the Carracci to compel the students of their school to aim at the direct imitation of the model, and to acquire the use of the brush; for the dark ground could only be overcome by very solid painting. The result answered their expectations as far as dexterity of pencil was concerned, but the method was fatal to brilliancy of colour. An intelligent writer of the seventeenth century relates that Guido adopted his extremely light style from seeing the rapid change in some works of the Carracci soon after they were done. It is important, however, to remark, that Guido's remedy was external rather than internal brilliancy; and it is evident that so powerless a brightness as white paint can only acquire the splendour of

light by great contrast, and, above all, by being seen through external darkness. The secret of Van Eyck and his contemporaries is always assumed to consist in the vehicle (varnish or oils) he employed; but a far more important condition of the splendour of colour in the works of those masters was the careful preservation of internal light by painting thinly, but ultimately with great force, on white grounds. In some of the early Flemish pictures in the Royal Gallery at Munich, it may be observed, that wherever an alteration was made by the painter, so that a light colour is painted over a dark one, the colour is as opaque as in any of the more modern pictures which are generally contrasted with such works. No quality in the vehicle could prevent this opacity under such circumstances; and, on the other hand, provided the internal splendour is by any means preserved, the vehicle is comparatively unimportant. It matters not (say the authorities on these points) whether the effect in question is attained by painting thinly over the ground, in the manner of the early Flemish painters, and sometimes of Rubens, or by painting a solid light preparation to be afterwards toned to richness in the manner of the Venetians. Among the mechanical causes of the clearness of colours superposed on a light preparation may be mentioned that of careful grinding. All writers on art who have descended to practical details have insisted on this. From the appearance of some Venetian pictures it may be conjectured that the colours of the solid under-painting were sometimes less perfectly ground than the scumbling colours (the light having to pass through the one and to be reflected from the other). The Flemish painters appear to have used carefully ground pigments universally. This is very evident in Flemish copies from Raphael, which, though equally impasted with the originals, are to be detected, among other indications, by the finely-ground colours employed."

Mr. Eastlake's observations on the nature of vehicles, or liquid media, to combine with the substance of colours, are likewise pregnant with information, but we must refer our readers for them to the book itself.

*Lights and Shades of Military Life*, Edited by Major-General Sir Charles Napier, K.C.B. 2 vols. 12mo. London, 1840. Colburn.

THESE volumes are from the French of Count Alfred de Vigny, author of the historical novel of "Cinq-Mars," and *M. Elzéar Blaise*; upon whose performances the editor has bestowed a certain proportion of desultory notes, not only applicable to their statements and opinions, but introducing a number of his own *de totidem rebus*, if not *de quibusdam aliis*. We like both parts. The Frenchmen are piquant and entertaining; and De Vigny, in particular, is a fair exemplar of the style and character of our neighbours' literature; whilst Sir Charles is quite as characteristic in his slapping, off-hand manner of treating all the points it has pleased him to pass in review. Both authors were soldiers, and their sketches refer to transactions in which they partook; and the editor, referring them to affairs in which the British military have been concerned, dwells on the differences that exist between the two services. These are, however, questions of too grave a nature to induce us to choose from them such specimens as we can give of this publication; and we trust our readers will better like the following. A story of a flat flat-bottomed boat manoeuvre of the Boulogne flotilla is worthy of Basil Hall:—

"The generals (we are told) were still

making the false movements of an ardour which they did not feel. They continued to send to sea a few miserable vessels, disdained by the English, and sunk by them from time to time. A command was given to me in one of these vessels, the very day after my arrival. On that day there was but a single English frigate at sea. She tacked with slow and majestic motion; she sailed to and fro, she inclined first to one side and then to the other, she looked at herself in the watery mirror, she glided along, she stopped short, she sported in the sun, like a swan that is bathing herself. The miserable flat-bottomed boat—a new and wretched contrivance—had ventured out pretty far, with four others of the same kind; and, having held on our course ever since morning, we began to be proud of our hardihood, when we discovered all at once the peaceful gambols of the frigate. They would, no doubt, have appeared to us extremely graceful and poetical, beheld from the shore, or if she had merely amused herself by playing her pranks between England and us, but it was, on the contrary, between us and France. We were above a league from the shore. This made us thoughtful. We set all our wretched sails, and plied our still more wretched oars; and, while we were exerting our utmost efforts, the peaceful frigate continued to take her sea-bath, and to describe a thousand pleasing figures around us, changing her pace and her direction like a well-trained horse, and making esses and zeds upon the water in the most delightful manner. We remarked that she had the good-nature to let us pass several times in front of her without firing one of her guns; nay, all at once, she drew them back, and closed her ports. I really imagined at first that this was a purely pacific manoeuvre, and was puzzled to account for such politeness. But a sturdy old seaman roused me by nudging my elbow, 'That looks bad,' said he. In fact, after she had suffered us to run a good way ahead of her, like mice before a cat, the amiable and beautiful frigate bore down upon us in full sail, and, without deigning to fire, dashed against us with her prow, as a horse with his chest, smashing, crushing, sinking, and passing merrily over us, leaving a few boats to pick up the prisoners, of whom I was one, and the tenth out of two hundred who had left Boulogne in the morning. The name of this beautiful frigate was the *Naiad*, and, to keep up the good old French habit of punning, we afterwards never called her any thing but the *Noyade*."

A few bits from M. Blaze, and we remit these entertaining *Lights and Shades* to the public as being well-deserving of perusal.

"At the battle of Ratisbon, one of my comrades was dreadfully wounded by a cannon-ball, which hit him precisely on the muscular part on which it is customary to sit. The surgeon cut, and carved, and pared away not less than four or five pounds of flesh; in short, the whole was gone—the whole moon, to use the expression of the Vicomte de Jodelet. Now, before that wound, this officer was five feet high at most; after his cure he measured six. People did not know him again. He had to tell his name to all his former acquaintance; for, not only had he grown so much taller, but he had filled out in proportion. Few men are so tall and stout as he became. I give this receipt for the benefit of all those who wish to increase their stature, and I guarantee its efficacy. Besides, it is not difficult of execution; a cannon-ball, duly applied, is sure to do the job. \* \* \* We were at Courbevoie. The emperor was reviewing a regiment

of the young guard, which had recently been reinforced by numerous conscripts. His majesty questioned one of these young men. 'And you, where do you come from?' said Napoleon to the left-hand neighbour of a friend of mine, then sub-lieutenant, now receiver-general. 'Sire,' replied the conscript, 'I come from Pezenas, and my father had the honour to shave your eminence when you passed through our place.' At these words the emperor became man, decorum was forgotten, and I do not think that Napoleon ever laughed so heartily, even while at the school of Brienne. Laughter is contagious, the review terminated merrily; the expression flew from rank to rank; from right to left, every one was bursting; and the native of Pezenas was proud of having been the maker of so much mirth."

Napier shall furnish us with but one extract.

"The observations made upon the French republicans are very good. Many of those gentlemen are alive, and may defend their conduct against the sarcasms of the writer, if they can. I believe that Carnot remained the most free from reproach; but, able as he was, and honest as he is said to have been, he acted in conjunction with the assassins of the 'reign of terror,' and finally he took the title of 'count' from Napoleon. How republican giants dwindled into pigmies in the hands of that commanding mind! The first must remain a stain upon Carnot's character for ever. The last, as he pretended to be a 'stern republican,' was pitiable or laughable, or what the reader pleases. Republicans are fond of being 'stern.' One was 'stern,' and put his own son to death. Another was 'stern,' and assassinated his benefactor, if not his father; being a usurer, he was also 'stern,' especially with his debtors—so 'stern' as to starve a cityful; for Brutus did these things by wholesale, just as the French republicans used grape-shot at Lyons. Sometimes Whigs, Tories, and Radicals, are 'stern path-of-duty men,' as Cobbett called them. But why men should pique themselves on being truculent instead of just I know not; but so it is, that republicans seem to rejoice (to use a newspaper word) in the title of 'stern.' Malesherbes was not 'stern,' though he was bold, when he defended Louis XVI., yet posterity will hold his character in higher estimation than that of the 'stern' Carnot. Men should be 'stern' to their enemies, but not to their countrymen; and, above all, not to those who are in their power. To be called 'stern path-of-duty men' seems to gratify some men; they seem to consider it as a virtue: so the men described by M. Blaze were, no doubt, 'stern' republicans, till the great Napoleon came, who was, I may say, bred in a republic; but no sooner did he get power enough to save his head from the guillotine, than he put an end to all that bloody work, and sterns were turned into prows, or, at least, figure-heads bedecked with coronets. Finally, they have finished by being objects of ridicule to the writer and other sensible men; and, in a few years more, will only be remembered, as other executioners are, by those who rummage history to find out the disgusting transactions of the age."

#### MEMOIRS OF ROMILLY. [Third notice.]

WE concluded our last Number with a remarkable criminal case, which we cannot more appropriately follow up than by quoting a brief notice of Romilly's observation on the administration of the law in France:—

"Sept. 11.—Attended again at the Tribunal Criminel; six men were tried together for for-

gery. There was no jury. The trial by jury for the *crimen falsi*, and likewise for the crimes of setting fire to barns of corn, &c., was taken away by a law made last May, or *Floral*. Till then, crimes of this description were tried by what was called a special jury, consisting partly of persons who by their profession were most likely to understand the subject (a sort of *experts*). The reasons given for superseding juries, as to these crimes, were, that the crimes had become very common, were extremely dangerous to society, and ought to be suppressed without delay. But, in truth, all crimes ought to be suppressed as speedily as possible; and if the trial by jury does not tend to the due execution of justice, and consequently to the prevention of crimes, the trial by jury ought to be abolished universally. The men I saw tried were, according to the last law, tried by six judges; their judgment must be unanimous to condemn. After every witness was examined, an examination took place of the prisoners by the judges. This would have much shocked most Englishmen, who have very superstitious notions of the rights and privileges of the persons accused of crimes. It should seem, however, if the great object of all trials be to discover the truth, to punish the guilty, and to afford security to the innocent, that the examination of the accused is the most important, and an indispensable part of every trial. I observed one objection to it, however; which is, that the judges often endeavour to shew their ability, and to gain the admiration of the audience, by their mode of cross-examining the prisoners. This necessarily makes them, as it were, parties, and gives them an interest to convict. They become advocates against the prisoners; a prisoner who should foil the judge by his mode of answering his questions, particularly if by that means he should raise a laugh from the audience, would have little chance of obtaining a judgment from him in his favour. Having heard a sentence of a man who was to be executed at the Place de Grève cried about the streets, I walked thither. The scaffold was erected, and the guillotine ready; a great crowd of persons were assembled, principally women. The ideas which the guillotine must awaken in every body's mind naturally render it an object of horror; but, independently of those ideas, the large slanting axe, the hole through which the neck of the sufferer is placed, smeared round of a different colour, and seeming to be yet stained with the blood of former malefactors, the basket placed to receive the head, and the large wicker chest in which the body is afterwards thrown, render it altogether a most hideous instrument of death. It seems to answer very well the idea of Montaigne, who, I think, somewhere recommends as the most proper public punishments those which make the strongest impression on the spectators, but inflict the least pain upon the malefactor. From the Place de Grève I walked back towards the Palais; and I there saw the prisoner brought out to be led to the place of execution. A small party of dragoons attended him; he was placed in a cart, his body naked, with a red cloak (or, according to the terms of the law, *une chemise rouge*) tied round his neck, and hanging loose over his shoulders. He had been convicted of a murder and robbery."

A week later, this Parisian journal contains an amusing anecdote:—

"At Notre Dame all the crucifixes and statues were removed, while public worship was prohibited, and the church was called the Temple of Reason. In the great choir is a mosaic pavement, with the arms of France, the fleurs-

de-lis, and a crown over them. This was not removed, but the following inscription is engraved upon it:—"Sous le règne des loix, la liberté, après avoir écarté tous les objets qui pouvoient blesser les yeux républicains, a conservé ce pavé par respect pour les arts."

A good *mot* is told hereabouts, that "the church would not bury Voltaire, for he had buried the church."

Again, of Buonaparte, first consul:—

"Sept. 23. 1 Vendémiaire.—Anniversary of the republic. Talleyrand sent me word, by Charles Fox, that I might be presented to-day to the first consul, together with Erskine, at his levee at the Tuileries. I had been disgusted at the eagerness with which the English crowded to do homage at the new court of a usurper and a tyrant, and I made an excuse."

It is very curious to consider what France is, to recollect what it has been during the last fourteen years, and to speculate upon what it is likely to be. A more absolute despotism than that which now exists here France never experienced: Louis XIV. was never so independent of public opinion as Buonaparte is: the police was never so vigilant or so well organised. There is no freedom of discussion; the press was never so restrained, as at present, under Louis XIV. and XV.; the vigilance of the police in this respect was eluded, and books, published in other countries, containing very free opinions, were circulated at Paris: but that is not the case now. Among other restraints, all English newspapers are prohibited; and it is said that even the foreign ministers are not permitted to receive them by the post. An opinion is entertained, whether with or without foundation I do not know, that persons of character, and who mix in good society, are spies employed by the police, and, consequently, that a man is hardly safe any where in uttering his sentiments on public affairs. It should seem, however, that few persons have any desire to utter them. I have been in several societies in which there was certainly the most perfect security, and where politics seemed the last subject that any body wished to talk upon. It may seem at first very wonderful by what means Buonaparte can maintain so absolute a power. It is not by the army; for if he is popular with the soldiers, it is only with those he has commanded: he does not seem, however, to have been ever very popular even with them. His character is of that kind which inspires fear much more than it conciliates affection. He is not loved by any of the persons who are about him, not even by the officers who served with him; while Moreau is universally beloved by all who have served with him. It is impossible to say that it is by the force of public opinion that Buonaparte reigns. There is certainly an opinion very universally entertained, highly favourable to his talents both as a general and as a politician: but he is not popular; the public have no attachment to him; they do not enjoy his greatness. Buonaparte seems, indeed, to despise popularity; he takes no pains to gain the affections of the people. All the public works which he sets on foot are calculated to give a high opinion of himself, and to immortalise his name, but not to increase the happiness of the people, or to alleviate the sufferings of any particular description of them. To increase the beauty and magnificence of the city, to build new bridges, to bring water by a canal to Paris, to collect the finest statues and pictures of which conquered nations have been despoiled, to encourage and improve the fine arts, are the great objects of Buonaparte's ambition in time of

peace. That he meditates the gaining fresh laurels in war can hardly be doubted, if the accounts which one hears of his restless and impatient disposition be true. His literary taste may serve to give some insight to his character; Ossian is his favourite author. When the Bastille was stormed by the mob of Paris, there were not found in it I think more than five or six prisoners; and to those the Bastille served as an hospital, rather than a prison, for they were advanced in age, and without friends. I am assured that there are, or at least very lately were, more than seventy prisoners confined in the Temple, the bastille of the present day; persons of the most adverse principles and opinions, some of them violent Jacobins, others emigrants and aristocrats. As persons of the most opposite opinions are subject to persecution, so are they, as indiscriminately, objects of favour. Fouché, who till a few days ago was minister of police, and was supposed to have the confidence of Buonaparte, was at Nantes one of the most violent revolutionists, in the very spirit, it is said, of Carrier. It is reported of him that he used at one time to wear in his hat the ear of an aristocrat, in the manner of a national cockade. What strikes a foreigner as most extraordinary at Paris, is that the despotism which prevails there, and the vexations and trifling regulations of the police, are all carried on in the name of liberty and equality. It was to establish liberty and equality on their true basis, according to Buonaparte's own declaration in the legislative assembly at St. Cloud on the 18th Brumaire, that he commanded his grenadiers to charge the assembly with fixed bayonets, and obliged most of the members to seek their safety by escaping through the windows. Liberty and equality are still sounded as high, and displayed in as conspicuous characters, as ever. In the front of the Tuileries, one of the most magnificent palaces of Europe, the most sumptuously furnished, filled with the finest pictures, continually surrounded with guards, and inaccessible but to those who are connected with the first consul, who makes it his place of residence, is displayed the word *Egalité* in large letters. You attempt to pass through an open passage, and you are rudely stopped by a sentinel, who, with the voice of authority, halloo out, 'On ne passe pas par ici.' You turn your head, and for your consolation behold, inscribed in characters which seem indelible, *Liberté*. And has it been only for this, and in order that a number of contractors, of speculators, of persons who have abused the military or civil authority they have possessed, may enjoy securely their ill-gotten wealth, that rivers of blood have been shed, that numbers of individuals, who by their talents and acquisitions were the ornaments of one of the most enlightened nations in the world, have perished on the scaffold, that the most opulent families have been reduced to misery, and languished out their wretched lives in exile! Such an exclamation is very natural. It is, however, to all these horrors of the revolution that Buonaparte owes his power. If public opinion is not strongly expressed in his favour, it is strongly expressed against every thing in the revolution which has preceded his consulate. The quiet despotism, which leaves every body who does not wish to meddle with politics (and few at present have any such wish) in the full and secure enjoyment of their property and of their pleasures, is a sort of paradise, compared with the agitation, the perpetual alarms, the scenes of infamy and of bloodshed, which accompanied the pretended liberties of France. Buonaparte is said

to entertain a very bad opinion of mankind, at least of the nation he governs. In consequence of that opinion he distrusts every body, and does every thing himself."

We now return to the Correspondence for a few further illustrations; and here is a remark on an early number of the "Edinburgh Review," which suits our literary columns:—

"Dear Dumont,—It is vain to wait for a moment of leisure; I may as well write to you, therefore, now that I have not an instant to spare, as at any other time. Anne told you, I believe, that there is no mention of you in the third number of the 'Edinburgh Review.' I don't think you have any reason to be sorry, unless you think it would be of use to your book\* to have it abused. The editors seem to value themselves principally upon their severity, and they have reviewed some works, seemingly with no other object than to shew what their powers in this particular line of criticism are. They begin their account of 'Delphine' with these words:—'This diabolical trash has nearly dislocated the jaws of every critic among us with gaping.' Of Fievée's 'Letters,' they say, 'It is some advantage to have this kind of standard of pessimism, to see the utmost extent to which ignorance and petulance can go;' and of Dugald Stewart's 'Life of Dr. Robertson,' which, upon the whole, they treat with comparative indulgence, they say at the conclusion, that a life of Robertson is a work yet to be written. There are, however, many articles in the last number of great merit; and it is, I think, upon the whole, very much superior to the second number."

The frequent offers of a seat in parliament to Romilly afford curious examples of the working of the borough system before the Reform-act. He was of opinion that a seat bought with your own money was the most independent of any. The Prince of Wales's favour seems to have been directed towards him, in order that he might secure an able and honest lawyer to investigate the famous Douglas evidence, &c., against the Princess; of which there is a great deal in these Memoirs. But we have not room to touch on the subject, excepting only one note:—

"July 1. Again at Lord Grenville's on the same business. The Prince had put into my hands several original letters of the Princess to himself, and to the Princess Charlotte. I took them with me; and, upon a comparison of the hands, no one of the four lords had any doubt that the anonymous letter, the inscriptions upon the obscene drawings, and the directions upon the envelopes in which the drawings were inclosed, were all of the Princess's own handwriting."

In 1806, Romilly was appointed solicitor-general, and his "Parliamentary Diary"† commences. Upon this he states,—

"I was this day sworn in, together with Piggott, the new attorney-general; and we attended the levee at the queen's house, and kissed the king's hand on our appointment. His majesty was pleased to knight us both, greatly against our inclination. Never was any city trader, who carried up a loyal address to his majesty, more anxious to obtain, than

\* "Traité de Législation Civile et Pénale."

† The purity of election is sweetly illustrated by his return for Queenborough, for he tells us:—"In less than four days after my election, I received applications from two of the electors to procure places for them; and of these, one, whose name is B—, had tired me, when I was at Queenborough, with long conversations, to explain to me the politics of the borough, and to state the grievances of the freemen; in the course of which he told me twenty times that he was speaking for his brother freemen only, and did not at all consider himself."

we were to escape, this honour. We applied to Lord Dartmouth, the lord in waiting; to Lord Grenville, Lord Spencer, and every body on whom we thought it might depend, to deprecate the ceremony which awaited us. But the king was inflexible. For the last twenty years of his reign, it has pleased his majesty to knight all attorneys, and solicitors-general, and judges, on their appointment, though for the first five-and-twenty years he had never seen the necessity or propriety of it; and now, every man who arrives at these situations must submit to the humiliation of having inflicted on him that which is called, but is considered neither by himself nor any other person, an honour. Perceval, the last attorney-general, had been permitted to decline knighthood because he was an earl's son."

Hear, also, what he says of "all the Talents," of which ministry he had become a branch:—

"Although the new administration has been formed in general of the public men of the greatest talents and highest character of any in the country, yet there are some few appointments which have been received by the public with much dissatisfaction, and none with more than that of Erskine to be lord-chancellor. The truth undoubtedly is, that he is totally unfit for the situation. His practice has never led him into courts of equity; and the doctrines which prevail in them are to him almost like the law of a foreign country. It is true that he has a great deal of quickness, and is capable of much application; but, at his time of life, with the continual occupations which the duties of his office will give him, and the immense arrear of business left him by his tardy and doubting predecessor, it is quite impossible that he should find the means of making himself master of that extensive and complicated system of law which he will have to administer. He acts, indeed, very ingenuously on the subject; he feels his unfitness for his office, and seems almost overcome with the idea of the difficulties which he foresees that he will have to encounter. He called on me a few days ago, and told me that he should stand in great need of my assistance; that I must tell him what to read, and how best to fit himself for his situation. 'You must'—these are the very words he used to me—'you must make me a chancellor now, that I may afterwards make you one.'"

Of Erskine he gives a characteristic description elsewhere (in 1808):—

"I dined to-day at Lord Erskine's. It was what might be called a great opposition dinner. The party consisted of the Duke of Norfolk, Lord Grenville, Lord Grey, Lord Holland, Lord Ellenborough, Lord Lauderdale, Lord Henry Petty, Thomas Grenville, Tierney, Piggott, Adam, Edward Morris (Lord Erskine's son-in-law), and myself. This was the whole company, with the addition of one person; but that one, the man most unfit to be invited to such a party that could have been found, if such a man had been anxiously looked for. It was no other than Mr. Pinkney, the American minister: this, at a time when the Opposition are accused of favouring America to the injury of their own country, and when Erskine himself is charged with being particularly devoted to the Americans. These are topics which are every day insisted on with the utmost malevolence in all the ministerial news-

papers, and particularly in Cobbett. If, however, the most malignant enemies of Erskine had been present, they would have admitted that nothing could be more innocent than the conversation which passed. Politics were hardly mentioned; and Mr. Pinkney's presence evidently imposed a restraint upon every body. Among the light and trifling topics of conversation after dinner, it may be worth while to mention one, as it strongly characterises Lord Erskine. He has always expressed and felt a great sympathy for animals. He has talked for years of a bill he was to bring into parliament to prevent cruelty towards them. He has always had several favourite animals, to whom he has been much attached, and of whom all his acquaintance have a number of anecdotes to relate; a favourite dog, which he used to bring, when he was at the bar, to all his consultations; another favourite dog, which, at the time when he was lord-chancellor, he himself rescued in the street from some boys who were about to kill him, under pretence of its being mad; a favourite goose, which followed him wherever he walked about his grounds; a favourite mackaw, and other dumb favourites without number. He told us now, that he had got two favourite leeches. He had been blooded by them last autumn, when he had been taken dangerously ill at Portsmouth; they had saved his life, and he had brought them with him to town; had ever since kept them in a glass; had himself every day given them fresh water, and had formed a friendship with them. He said he was sure they both knew him, and were grateful to him. He had given them different names, Home and Cline (the names of two celebrated surgeons), their dispositions being quite different. After a good deal of conversation about them, he went himself, brought them out of his library, and placed them in their glass upon the table. It is impossible, however, without the vivacity, the tones, the details, and the gestures of Lord Erskine, to give an adequate idea of this singular scene."

With this we conclude for the present, and hope to wind up with one other paper.

#### BENNETT'S VOYAGE ROUND THE GLOBE.\*

[Third notice.]

WE proceed with our notice of a coral formation.

"The entire island does not exceed five miles in circumference, and is composed of several small circular peninsulas, arranged in a crescentic and nearly circular form, and each connected to the other by a low isthmus of sand, shingle, or dry reef, which, judging from its appearance, might at one time have given passage to the sea. A capacious lagoon, belted by a sandy beach, occupies the centre of the land, and is protected on its eastern or weather side by a barrier coral reef, against which a heavy surf breaks constantly. The peninsula that forms the southern extremity of the land is much larger than any of the others; and it was on the broad and sandy isthmus which connects this to the adjoining peninsula that we landed. The boat was borne by her crew across this sandy tract and launched upon the lagoon, for the purpose of ascertaining if there was any navigable communication between its waters and the ocean. No trace of such a convenience was visible, however, excepting at the barrier-reef, where we discovered an aperture which was sufficiently broad to permit the boat to pass into the open sea and to return, without difficulty, although a surf of extreme grandeur and impetuosity

broke on the rocks within two oars' length on either side. The lagoon-sea is for the most part very shallow, though there are some narrow channels in which it is several fathoms deep. It sleeps in the embrace of the land, unruffled by the slightest wave, and is nearly surrounded by vegetation. Its shallower waters contained myriads of small fish; and in its greater depths, many species of large size, gaudy colours, and often of very strange forms, could be seen moving slowly through dense groves of tree-coral. On its shoal reefs, *bêche-de-mer*, star-fish, *sepia*, and many varieties of shell-fish, were scattered in great profusion. But few objects in nature present a more interesting and animated picture than a coral-reef in tranquil water, and no reefs we had seen could compete with those of Caroline Island for novelty and beauty. The structure of this island offers no material but coral, in all its various forms. Its elevation nowhere exceeds five feet; while its shelving shores and coral rocks, arranged as terraces each above the other, denote the gradual recession of the ocean from the land it had so materially assisted to raise. The interior of the island is a surface of sand, mingled with coral debris, as well as with decayed vegetable and animal matters, which give it an increasing fertility. Each peninsula is covered with vegetation of a highly verdant and pleasing character, some of the loftier trees attaining the height of twenty feet. No collection of fresh water is to be found here; though, doubtless, as in many other of the low coral islands, much of good quality may be procured by excavating the sands.

This island is very seldom visited, although it is usually 'sighted' by South-Seamen, when on their way from the Society Islands to the North Pacific. About seven years previous to our visit, Captain Stavers had landed on its shores and left some hogs, but no traces of the present existence of those animals were visible to us. That some ship had lately touched here was evident, however, from several of the cocoa-nut trees having been recently cut down to obtain their fruit—a practice often dangerous when these trees afford important land-marks to navigators, and one at all times selfish and mischievous, and more particularly so here, where cocoa-nut palms, although increasing in number, are as yet but few. The only quadrupeds we saw here were rats of a red-brown colour. Amphibious birds were exceedingly numerous. Myriads of frigate-birds, engaged in fishing at a short distance from the coast, followed our boat, and hovered as a dark cloud over the island. Their curiosity (and no creatures could better express that feeling by their actions) induced them to approach us very closely, wheeling round our heads with inquiring attitudes, which plainly demanded who we were? and what was our business on their domain? One of them, knocked down by a boat-hook, after struggling a few minutes in the sea, again rose and renewed its flight, notwithstanding the prevalent opinion amongst nautical men, that these birds are equally incapable of rising from the surface of the water as from level land. Small white terns (*Sterna nivea*) were also as numerous and familiar as the former birds, and flew so close to us that we captured them with ease. Their appearance is delicate and beautiful. They are rather larger than a snipe; their plumage, snow-white; their eyes, dark and full; their beak and legs, of a light-blue colour; their cry is shrill, short, and frequently repeated. The greater number of trees on the island were occupied by boobies,

\* "Before the great seal was given to Erskine, it had been offered to each of the two chief justices. Mansfield declined it on account of his age; and Lord Ellenborough because his office is almost as lucrative, and is held for life; and perhaps because, being unaccustomed to courts of equity, he thought himself unfit for the office."

engaged in building their nests or in hatching their eggs. In plumage and paint these birds are peculiar. Their garment is dull-grey, darker on the back and wing-coverts than on the abdomen; the tail and rump are perfectly white. Their beak is blue, and encircled at its base with a rose-coloured paint; the naked skin of the cheeks is also blue, while that below the lower mandible is black; the legs are brick-red. We obtained examples of both sexes, but could observe no appreciable difference in their appearance. Their nest consisted of a circular layer of dried herbage. Some trees had six or eight nests on their branches; but to build in republics is not the invariable practice of this bird, since a few trees had each only a solitary nest. Most of the nests contained a single egg, of a greenish-white colour, and about a third smaller than that of the domestic hen. We found no newly-hatched birds, although all the eggs we examined were far advanced in incubation. The boobies employed in building their nests were much more shy than I had anticipated, flying away on the slightest alarm; but those that were 'setting hard,' as the schoolboys say, erected their crest, screamed and threatened on our approach, and remained firmly on their nests until removed by force, when they went off to sea much discontented. The other birds of the coast were a kind resembling a coot, curlews, and a species of *Totanus*, similar to that we found at Raiatea, with the exception that its legs are lemon-colour, while in the Raiatean species they are blue. They frequent the reefs and feed upon small crabs. The inland thickets contained a great number of small pigeons, with white head and neck, and the rest of their plumage of a rich brown colour. Fish are abundant around the coast, and also in the lagoon. One example (a species of *Sparus*), taken in the lagoon, weighed upwards of seventy pounds. Sharks were exceedingly numerous, and differed in appearance from any we had elsewhere observed: they are of a light grey colour, each of the fins being tipped with black, and the black apex of the dorsal fin having a broad white band at its inferior border. They proved very annoying to our boat's crew, for, not contented with gorging the hook baited for other and more savoury prey, they eagerly grasped the fish that were hooked, and devoured them before the fisherman could secure his prize. Eels without pectoral fins (*Gymnothorax*), of immense size, and speckled black and white, basked in the pools of the reefs; and when disturbed, displayed so much fierceness as rather to resemble serpents than fish. We observed no lizards or other land amphibia; nor any insects, beyond two species of butterfly; the one of small size and white, the other resembling the purple *papilio* of Tahiti. The entire island was covered with hermit-crabs, or 'land-lobsters' (*Canobita Sp.*), occupying the shells of *Turbo argyrostoma*. They bore a general resemblance to the largest species of *Pagurus* we found in the reef-waters of the Society Isles, but differed essentially from it in generic character, as well as in possessing terrestrial habits. The anterior and crustaceous portion of the animal (or that usually protruded from its tenement) is bright red, while the posterior and covered part of the body is flaccid, and of a yellow colour. The left forceps claw is larger than the right, though both are shorter than the first pair of legs; the eyes (ophthalmic peduncles) are long, and admirably adapted to afford a wide range of vision when the *canobita* is closely retracted within the shell it inhabits. Their odour is

peculiar and disagreeable. They were for the most part assembled in dense crowds, beneath bushes, or in shallow excavations at the roots of trees; though some of them, notwithstanding the cumbrous shells they carried, were clustered on the branches or in the crevices of trees. It is evident that, with the assistance of their forceps claws, they could climb a perpendicular height with great facility. It is a curious fact, that the most unique and elegant univalve sea-shell in my collection was gathered from the branch of a tree, whither it had been conveyed by one of these creatures. When alarmed they retreated, bearing their shells with them; but if touched they shrunk into the cavity of their dwelling and remain motionless. They sometimes, though very rarely, used their forceps in self-defence. When irritated they produce a shrill croak, alternating with a rapid succession of sipping sounds. We preserved several of them alive for many weeks. They ate both animal and vegetable substances, as fish, land-crabs, yams, and cocoa-nut. It was amusing to see them feed, nipping off, with much nicety, a portion of the food with their forceps, and carrying it to their mouth, where it was received by the two small appendages in front of that organ. Night was their most busy time. When removed from their borrowed tenements they easily regained them, and resumed their former position; while the vast number of empty shells strewn over the land indicated how frequently they changed their habitation during their progress to a mature growth. Amongst the many interesting shells strewn over the reefs and beach, we noticed the wing-shell (*Pinna*), and a few imperfect specimens of that rare and valuable species the orange-cowrie. The deepest parts of the lagoon contained some pearl-shells; and *bêche-de-mer*, of the black variety, was scattered in great profusion upon the reefs. We attempted to capture a large cuttle-fish, which we found imprisoned in a pool of sea-water; but the instant it was approached the animal obscured the water by emitting an inky fluid, and retreated beneath a block of coral, to which it adhered so firmly by the suckers on its arms that all our attempts to dislodge it were vain. The vegetation of this island is surprisingly luxuriant, when compared with the arid soil it covers. It is chiefly of a littoral character, and clothes the peninsulas with verdure, almost to the water's edge. The Society Islanders we had on board recognised, in all its examples, plants familiar to their own shores. Cocoa-nut trees obtain only on the southern side of the land, on the verge of the lagoon: they are of dwarf stature; and although the quantity of food they produce is great, the nuts are small, and the fluid they contain has often a brackish taste. On other parts of the island, as yet unoccupied by these useful trees, we noticed several ripe cocoa-nuts cast on the beach, and already beginning to germinate; while amidst the original groves the number of vigorous seedlings fully confirmed Capt. Stavers's statement, that these palms had increased greatly since his last visit to the spot."

And thus are new lands formed, and, ultimately, being prepared by animals, peopled!!! We have only to append to the description a curious note of incubation:—

"The snowy terns, so conspicuous on Caroline Island, were equally numerous here, and afforded us many examples of their eggs. It is a remarkable feature in the economy of this bird, that it does not even pretend to construct a nest, but simply deposits its solitary egg upon

the bough of a tree; selecting for this purpose shrubs destitute of foliage, and a branch of horizontal growth. Notwithstanding the exposed situation of these eggs, they are, in fact, very difficult to find; and it was not until long after the solicitude of the parent birds informed us that their spot of incubation was near, that we could solve the mystery which attended their nursery. Each egg is the size of a pigeon's, and marked with chocolate-coloured spots. Considering the slenderness of the branches on which they are deposited, it is remarkable that the eggs (which appear to be at the mercy of every passing breeze) should retain their extraordinary position during incubation, while what may be the habits of the newly-hatched birds we had no opportunity of learning, as none of the latter came under our observation."

View of the Coral Island.

## MISCELLANEOUS.

*Lays and Legends of Kent: Sir Robert de Shurland.* Edited by the Author of "The Sea Wolf." 4to. pp. 23. 1840. London, Ball and Arnold; Canterbury, Ward.

OUR provincial legends are always curious and interesting, that of *Sir Robert de Shurland*, of the Isle of Sheppy, has lately been made so popular by the humorous pen of the immortal Ingoldsby (see "Bentley's Miscellany"), that the present edition seems a little tame. But we like the plan well, and hope to see it followed up with spirit. Kent is rich in stores.

*Dodd's Church History of England: with Notes, Additions, and Continuations.* By the Rev. M. A. Tierney, F.G.S. Vol. III. London, 1840. Dolman.

THIS volume is addressed to the time of Elizabeth, and the barbarities of the religious and political executions are detailed with frightful fidelity. There is an appendix of documents, &c., occupying nearly half the volume; and as much done as can be done to make out the Romish persecuted faith.

*Hawkwood; a Romance of Italy.* 3 vols. London, 1840. Saunders and Otley.

THIS is a long narrative of the wars in Italy during the dominion of the Viscontis. As a novel, or romance, it possesses little interest: there

was a murderous struggle for supremacy, and who lost or who gained, where all were base, must be a matter of indifference to the novel reader. As a history of the time and manners of the then harassed people it furnishes a faithful picture.

*The Rural Life of England*, by W. Howitt. (London, Longman and Co.)—A second edition of this pleasing work justifies the opinion we had the satisfaction of giving on its appearance.

*A General Volume of Epitaphs, Original and Selected; with a large Selection of Striking and Appropriate Tests of Scripture, and an Historical and Moral Essay on the Subject.* By a Clergyman.—The author has penned epitaphs for almost every station and circumstance in life or death, and wishes to supersede the homely, and often grotesque, epitaphs which teem in our churchyards. We cannot very well make up our minds whether the variety and natural expression of some of the latter do not compensate for the whimsicality and oddity of the rest.

*A Letter from Abel Knockdunder, Lieutenant H.P., to Mr. Luke Tinto, Haberdasher in Glasgow, &c.* Pp. 40. (Edinburgh, A. and C. Black.)—A cleverly written epistle on a schism which has arisen in Edinburgh relative to the proceedings of the Association for the Promotion of the Fine Arts in Scotland. One party maintains that the pictures ought to be bought annually only from the Exhibition of the Scottish Academy; whilst the other contends for the purchasing also from the Exhibition of Artists in St. Andrew's Square. The first appear to act most agreeably to the original constitution of the Association; and in all such cases we are certain of opinion that the true object ought to be the encouragement of high art, and not of inferior productions, which it is merely a charity to take off the walls.

*Mrs. Charles de Havilland's Outline of the History of Ancient and Modern Rome* (Houlston and Stoneman) has, we observe, reached a second edition, and is considerably improved. It is an instructive little book for youth.

*Tales of the Kings of England, &c.*, by Stephen Percy. (London, Tilt.)—Another nice book for children, and well devised to entice them into historical reading. The stories from the olden writers are well told and very tastefully illustrated.

*Cost Too Good.* No. I. (London, Cunningham.)—We are always ready to signalise the entry of new periodicals, and to give the most favourable opinion we can of their promise: in this instance, however, we are prevented, from not being able to understand the writer's plan or object. Perhaps he may develop as he goes on?

*Knight's English Classics.* Part I. (London, Knight.)—This very neat small quarto of 128 pages (double columns), is the first of an edition of celebrated English authors, and gives the *past* to Goldsmith's "Citizen of the World." It is prettily adorned with woodcuts, and the series, if equally well selected and executed, will deserve a wide popularity.

*Knight's English Miscellanies. The English Causes Célèbres.* Part I. (London, Knight.)—Similar in form and price to the foregoing, this series is announced to comprehend many varieties of literature, such as biographies, familiar letters, old travels, &c. &c., and being unembellished with cuts, will contain a larger proportion of letter-press. The trials of Count Königsmark, Colonel James Turner, and other distinguished criminals, occupy the opening pages.

*Wilson's Remarkable Trials of all Nations and Eras.* 8vo. (London, Clow.)—This is a weekly and monthly issue of similar matter; and, in the part before us, we have the trials of Jack Sheppard, Robert Emmet, Richard Gould, &c., and some translated from the French. The public appetite runs on such food just now, and the late horrible and undiscovered murders of Mr. Templeman and Lord W. Russell are calculated to whet it.

## ORIGINAL CORRESPONDENCE.

### PENSECUTIONS OF THE EASTERN JEWS.

To the Editor of the *Literary Gazette*.  
25 Broad Street Buildings, April 29, 1840.

SIR,—In your Journal of the 18th instant, you inserted a letter from a correspondent in the East, detailing the horrid and disgusting accusations which had been brought forward against the Jews of Damascus, fully accrediting the whole calumny, and almost vouching for its truth.

This account you say "will be acceptable to your readers;" and, again, "if the authority were not beyond all doubt, it would appear almost incredible." You gave currency to this vile libel without any examination into its probability, or a single line expressive of your own disbelief in it; and yet, according to the shewing of your credulous correspondent, it rested on no better authority than the confessions wrung by torture from the accused. When I was first informed that an article so contrary to the accustomed tone of the Journal, so adverse to common sense, so disproved by

the history of past ages, and so opposed to the Mosaic laws and the spirit of the Jewish religion, had been published in the *Literary Gazette*, I did not give credence to it. I believed that Journal would have been the first to repudiate, with indignant disgust, the revival of the long-forgotten falsehoods of the middle ages, and that it would have perceived at once that the only true object of such accusation must have been plunder; but, to use the words of your correspondent, "I found it too true."

In your Number, too, of the 25th instant, whilst you give insertion to a letter from Paris disproving the whole statement, and placing it on its true footing, you express some surprise that no one of the Jews of London had taken up the refutation in your Journal; I might reply to you, sir, that whilst the Jews of London have not been idle in endeavouring to protect their Eastern brethren, they did not think of refuting a tale which, although fully told by all the chief French and English journals, had been disproved by some of them, and by all indignantly disavowed, except by the *London Literary Gazette*. It is, however, not yet too late. Allow me to request your powerful aid in the cause of suffering humanity to pluck off the mask from the oppressors of the Eastern Jews, and to hold them up in their true colours; not as persons seeking justice for outrages committed against human nature, but as avaricious and blood-thirsty tyrants, anxious to injure and despoil those whom they hate, and of whose wealth they covet the possession.

You, sir, are too well acquainted with the history of past persecutions to doubt the origin of this; and that it is going on at a distance from this country, and amongst those who are strangers to you alike in blood, in language, and in faith, will, I trust, be no reason with you for withholding your exertions, "Homo es, et humani nihil a te alienum puto." Afford me then, sir, as an humble advocate for the oppressed, a short space in your columns—not to deny nor to disprove the atrocious charge, for I should hold it to be an implied insult to my fellow-countrymen, your readers, to presume for a moment that here and at this time there could be found a single person of sound mind capable of believing that, in order to perform the ceremonies of the passover correctly, murder must be annually committed by the Jews in every place wherein they reside, and the blood of the murdered individual be mixed up with their food to be then eaten. Yet this, sir,—false, gross, abominable, and incredible as it is—is the charge advanced against the Jews of Damascus and Rhodes; and on which charge, unsupported by any evidence worthy of even the slightest credence, they have been, and perhaps are still, cruelly, mercilessly tortured, and destroyed.

I fully agree, sir, with the sentiments of our respected chief rabbi, Dr. Hirschell, who, in a letter addressed to the Board of Deputies of British Jews, says, "I feel the greatest disgust and indignation at the revival, for vile purposes, of such forgotten calumnies against a religion which is so far from approving such a crime as the shedding of human blood, that the slightest admixture of the blood of any animal would pollute the common food of man, much more would human blood desecrate and render abominable a religious rite;" but, sir, if there should be any one of your readers so insane as to incline in the least to believe such terrible accusations, I beg to refer him for a full and complete refutation to the lan-

guage of the celebrated Menassah ben Israel, addressed to Oliver Cromwell, to the well-known work by Dr. Tovey called "Anglia Judaica," where he will find this subject fully examined; and then, sir, if he desire to investigate further, I request him to turn to our own English chronicles, to the annals of our Richards and our Henrys, where he will read enough, and more than enough, to stain the records of their reign, of the persecutions the Jews of that time suffered under this and similarly foul and false calumnies; where he will learn how each proud baron often tortured any unoffending Jews he could get into his power under any pretext, or sometimes without any pretext, to wring from them their hard-earned wealth; how the poor sufferers found nowhere protection, save from the crown; and how this protection was but too often of the same kind that we afford to the sheep against the wolf, that we may fatten the animal for ourselves to rob it of its fleece, or slaughter it when it may suit our own purposes. Or, sir, he may purchase, for a couple of shillings, at any bookseller's, the whole of the ceremonies of the passover, in Hebrew and in English, minutely set forth and explained, in the manner they are practised by Jews throughout the world. They consist of various ceremonies and relations commemorative of God's goodness in redeeming his chosen people from the servitude of Egypt, of earnest thanksgiving to the Almighty for past protection, and of pious prayers for the future: these are the Jewish ceremonies and proceedings in the passover—*none other*.

In this happy country, sir, where liberal sentiments are not nominal, but practical; where Britons, although they may differ in faith and hope, unite in all offices of charity and loyalty where the Christian of every denomination joins readily with us to relieve the distressed of suffering Jews; to heal the sick, to feed the hungry, and to clothe the naked; and where the Jew, whether foreign or British born, rejoices to add his mite to the purely Christian charities of his adopted country; where all unite in amity and love, loyal to their sovereign and obedient to the laws, and contending only in the glorious race for distinction in commercial, philanthropic, or literary pursuits;—in this country, sir, such calumnies need not be refuted, they cannot be believed; but, sir, the voice of the British press is like the power of Britain—gigantic, all-pervading, extending to the utmost verge of the known world, respected wheresoever it extends. It is on this voice that I call for the defence of my poor, tortured brethren; and as the Christians of the East have been made in some degree the excuse of those cruelties, I call on all British Christians, on all true professors of a religion which abounds in sentiments of charity, and teaches peace and goodwill to all men, to avow at once their total disbelief of such vile and execrable accusations, and to extend the powerful protection of their humane interference to snatch the suffering Jews of Damascus and Rhodes from the oppressive grasp of the too-cruel monsters.

Let this country, which proudly boasts universal toleration throughout its dominions, which endures not that the existence of slavery should pollute the air of any of its possessions, whose arm has been stretched forth in the cause of suffering humanity in Greece, in Spain, in Hindostan, and in Africa, add this one more triumph to its many previous ones in the same good cause. So shall the Jews of this and every age praise and bless the intercession of Britain, and the great and good throughout

the world approve and extol, and the governors of this land find in the approval of their own consciences their best and purest reward. I am, &c. BARNARD VAN OWEN, M.D.\*

To the Editor of the Literary Gazette.

Paris, May 6th, 1840.

SIR,—It was not my intention to have again intruded on your attention any remarks relating to the Jews, but I have just found in the "Annales de la Propagation de la Foi" a report, dated March the 5th, from a Capuchin monk of Beyruth, sent to Damascus by order of his superior at Beyruth, to examine into the accusations against the Jews. He adopts the prejudices of the people *in toto*; and further states, that he himself had the supposed bones of Father Thomas, which were found in the sewer of the town (those very bones which the Austrian consul at Beyruth says have been ascertained to be animals' bones, which had lain in the sewer a very long time), put in a coffin, and transported to the house of the French consul: that all the Christian clergy of Damascus followed chanting hymns in the procession: that the British consul also formed part of this procession; and that, after having performed solemn mass over the coffin at the French consul's house, he had it carried to the Capuchin church at Damascus, and laid by the altar of St. Elias, until a monument with a commemorative inscription should be raised over it. He represents the French consul as having been the most active in the proceedings against the Jews, instead of protecting them; and hints at all the consuls having been on the same side. I think, sir, you will agree with me that here is a pretty strong case to be laid hold of by the British government, the character of the nation being involved in the conduct of its consular agent; and that a very strict inquiry must, at all events, be set on foot. I have this morning learned from Smyrna that at Rhodes, where a similar accusation has been got up against the Jews, on occasion of the disappearance of a Greek boy, the Turkish authorities wished to let the matter drop, and took little or no notice of the absurd rumours that circulated; but that all the consuls came forward, and demanded that the Jews should be interrogated (we have seen how the word *interrogation* may be sometimes understood in the East); that the pacha declined doing so; and that the consuls themselves proceeded to the interrogation of the Jews: but that they ultimately abandoned all further proceedings against them, at least for the present. Have we a consul at Rhodes? and was he one of these interrogators?—I humbly suggest that these are questions which the Foreign Office should be held bound to deliver a categorical answer to within the shortest possible delay. I have only one more question to ask:—When Europeans go to eastern countries, what is it that they do with their humanity

\* Our feelings in the cause induce us to give this letter a place in the *Literary Gazette*, though we cannot but think that it takes an unfair view of our conduct. The only way to elicit Truth is to hear all that can be said on all sides; and it is not by concealing what an enemy alleges that we can meet and defeat him. It is, besides, our duty as public journalists to state frankly the facts communicated to us; and upon these, whether *pro* or *con*, to give our candid opinions. Never entertaining an idea that the enlightened Jews of England or France could be compared with their ignorant and slavish brethren in the East, we deemed it only right to insert the correspondence, which reached us from a respectable source; but no one can rejoice more than we do to see these tyrannical and bloody pretences for oppression and murder overthrown, and we gladly lend our arm of the press to that object. We also rejoice to learn that Mehemet Ali has interposed to save the Jews from further persecutions, and secure them an impartial trial on the charges brought against them.—Ed. L. G.

and their good sense?—I remain, sir, your most obedient servant, PHILEATHES.

## ARTS AND SCIENCES.

### SOCIETY OF ARTS.

[By accident this, the last illustration, was omitted at the proper time.]

MR. GODDARD, of the Royal Gallery of Practical Science, 'On Double Refraction, and the cause of the Colours exhibited by Crystals in Polarised Light.'—Mr. Goddard commenced by briefly explaining the nature of polarised light; he then observed that all transparent media consisted of two kinds, one possessing single refraction, and another that divided a pencil of light passing through them into two pencils, and was, therefore, said to possess double refraction. Crystals are arranged in six systems:—1st. The octahedral (or tessular system of Mohs); 2d. The pyramidal; 3d. The rhombohedral; 4th. The prismatic; 5th. The oblique prismatic; 6th. The doubly oblique prismatic. All crystals belonging to the octahedral system possessed single refraction; and all those belonging to the other five systems, double refraction. In explaining the nature of double refraction Mr. Goddard stated, that according to the undulatory theory ordinary light consists of a rapid succession of undulations, composed of vibrations in every possible plane, which in passing through doubly refracting media were resolved into two sets of undulations vibrating in planes at right-angles to each other. When a pencil of light is transmitted through large crystals possessing this property in an eminent degree, as in calcareous spar, the separation will be sufficient to produce a double image. But in thin plates of such crystals, although the same action takes place upon the light, the two images are superposed. When such a plate is exposed to polarised light, which consists of undulations or vibrations in one plane, there are found to be two lines crossing the crystal at right-angles to each other, which, when either of them coincide with the plane in which the vibrations of the polarised light take place, it will be transmitted unaltered without being doubly refracted; but when these lines are inclined at an angle of 45° to the same plane, the light is doubly refracted, and, on emergence, consists of two sets of undulations, vibrating in planes at right-angles to each other. These are afterwards, by the analysing plates of mica, each of them again resolved into two others, constituting four sets of undulations, originating from one and the same set of undulations in the polarised pencil. Two of these are reflected, and being brought into the same plane, will necessarily interfere; and the other two, which are refracted, being also brought into the same plane, but at right-angles to the plane of reflection, will likewise interfere. Mr. Goddard then shewed, that in whatever degree this interference takes place, in one case the undulations would conspire, and in the other oppose. The colours produced will therefore be complementary, which was a necessary and beautiful consequence of the undulatory theory. Mr. Goddard illustrated the subject by many beautiful and original models which he had invented, some to represent the different systems of crystals, and explain their action upon light, and shewing the directions in which they should be cut to exhibit their optical phenomena; and concluded by shewing a number of splendid experiments by means of his improved polariscope, amongst which were some curious and beautiful phenomena of composite, or tessellated and twin crystals.

### LINNEAN SOCIETY.

THE Bishop of Norwich in the chair.—Mr. Janson exhibited beautiful flowering specimens of the *Linnea borealis*, *Chrysosplenium alternifolium*, and *Dolichos Lubia*, from his garden at Stoke Newington. Read, a continuation of Mr. Smith's paper 'On the Genera of Ferns.' Read, likewise, 'Additional Observations on some New Plants allied to the Natural Order *Burmanniaceae*,' by Mr. Miers. The paper chiefly refers to the relative disposition of the several floral organs in that family; the great peculiarity of which is, that the placenta are placed opposite to the stamens and to the inner segments of the perianth.

### ELECTRICAL SOCIETY.

TUESDAY, 5th May.—Read, a paper by Mr. Walker, entitled 'Results of an Experimental Survey of an Electro-Magnetic Coil.' Great perseverance, untiring industry, and extensive calculations, have been employed to produce the "results." The various data appear to have been very carefully obtained, and every precaution taken to cause them to be correct representations of the angles, &c. they profess to record. The tabular arrangement, and the absence of diagrams, prevent our entering at length into the details of the survey, which will, however, be published in the Society's "Journal." The general conclusions Mr. Walker deduces from his experiments are that the electrical energy existing in each layer of a coil is equal to that of any other layer, whether towards the centre or towards the circumference; and that the chord of the arc of the needle's deviation is a measure of a condition in a coil not easily estimated by any other mode. One of the tables represented the place of a single force, calculated to produce the same effect as the whole coil; and Mr. Walker observes, "Should this position stand the test of Ampère's formula, then the opinion advanced in favour of the equal distribution of the power would be established beyond doubt." The opinion more familiarly stated is, that electricity in motion is *equally* distributed along the whole line or path of its transit.

### ROYAL INSTITUTION.

FRIDAY, 1st May.—Mr. Griffiths, 'On the History, Sources, and Uses, of Sulphuric Acid.' From Basil Valentine, in the middle of the 15th century, to the present day, the various improvements in the manufacture of this most important compound, the key to many treasures as Boyle called it, were traced and most clearly described and illustrated with models, diagrams, &c., on a large scale. The two principal modes of procuring the sulphuric acid of commerce are, the one conducted at Nordhausen, in Germany, and that in England, as also now generally on the Continent. The former is by the decomposition of the protosulphate of iron, by heat and by subsequent repeated distillation; the latter by the combustion of sulphur and nitre. But, as this involves a more complicated natural process, and discloses the wonders and beauties of chemical affinity, we will endeavour to describe briefly the changes that occur after the gaseous products of the furnace have been sent into the leaden chamber, into which also steam is passing, and the bottom of which is covered with a thin stratum of water. The ingredients then present in the chamber where these changes occur are sulphurous and nitrous acid gases, watery vapour, and atmospheric air. These gases, when dry, of themselves have no inclination to unite, but the presence of watery

vapour determines their union; the result of which is the decomposition and resolution of the nitrous acid gas into nitric oxide or the deutoxide of nitrogen, by the loss of one of its equivalents of oxygen, which has combined with a portion of the sulphurous acid gas to produce solid anhydrous sulphuric acid; and this white crystalline substance, falling into the water at the bottom of the chamber, is there dissolved and retained. The free deutoxide now plays an important part; it mingles with the atmospheric air, which it robs of, and greedily unites with: a portion of its oxygen becoming thus again nitrous acid gas, which again combines with the sulphurous acid gas to be re-decomposed, to produce more sulphuric acid. The deutoxide is, as it were, a carrier of oxygen from the air to the sulphurous gas, itself being converted into the nitrous gas during the intervals of change; and this goes on so long as there may be sulphurous acid gas, watery vapour, and atmospheric air present. When the water layer is sufficiently acidulated, it is drawn off into evaporators, and afterwards concentrated by distillation in platinum retorts. In England alone, annually, 60,000 tons are manufactured.

#### ELECTRO-MOTIVE POWER PRACTICALLY APPLIED.

WE were invited, on Tuesday last, to a private view of an electro-magnetic machine, now exhibiting at the Colosseum, Regent's Park, and for which a patent has been taken by an American gentleman named Taylor. An inspection of this machine convinced us that the problem of the practical application of electro-magnetism to the production of an efficient motive force, is much nearer solution than we previously conceived. The apparatus consists of a wheel two and a half feet diameter, on the circumference of which are set a number of pieces of soft iron (we believe seven), and of four stationary horse-shoe magnets, attached to the frame in which this wheel revolves: by means of a contact breaker concentrically fixed to the wheel, and formed of alternations of copper and ivory, these soft-iron cores of the electro-magnets alternately acquire and lose their magnetism; while, in the former state, one of the pieces of soft iron on the wheel is attracted until it arrives opposite the magnet, when the latter, losing its magnetism by breach of battery contact, the former is carried on by momentum, and another arrives opposite the sphere of attraction just as the magnetism is again acquired, and so on in rotation. The dogs, which press by means of springs against the contact breaker, are irregularly placed, so as to have one of the four horse-shoes always magnetised, and thus the force is continuous and uniform. By an ingenious contrivance, these dogs are capable of being shifted so as to stop or back the wheel. The motive-power employed was one of Grove's batteries, containing a series of 5·4-inch square plates, and occupying a very small space. To the wheel was connected a lathe, in which articles were turned—wood, ivory, or iron—by an assistant; and, with this drawback, it performed 150 revolutions in a minute. Considering the extreme infancy of the science of electro-magnetism (it is only twenty years old), and the rapid strides it has made within the last few years, we can now, without doubt, hail as fast approaching the period when this power will be generally employed in the arts. Although, as contrasted with steam, it may be in its present state somewhat expensive, yet it admits of application to minor machinery, such as printing-

presses, turners' and cutlers' lathes, &c., to which steam-power would be impracticable; and it has the great advantages of extreme simplicity of construction, ease of management, and absence of danger.

#### PARIS LETTER.

Academy of Sciences, May 5, 1840.

IN consequence of the lamented decease of the President, M. Poisson, no sitting was held on the 27th of April. The funeral of this gentleman took place with great ceremony, all the leading men of science in the capital, deputations from all the academies and scientific bodies, the Chambers of Peers and Deputies, the Ecole Polytechnique, and the Ecole Normale, headed by the Minister of Public Instruction, and accompanied by H. R. H. the Duc de Montpensier, following the funeral cortege to the cemetery of Père la Chaise. M. Arago, M. Pontecoulant, and other savans, pronounced some animated harangues over the grave; a student of the Ecole Polytechnique added a few simple but affecting words, and M. Cousin, Minister of Public Instruction, gave a worthy termination to the ceremony by an elaborate oration, in which he pronounced the most fitting eulogium on the deceased, by styling him "the most illustrious geometrician of Europe."—The Academy has just sustained two other severe losses: one in the person of M. Robiquet, the eminent chemist; the other in that of M. Turpin.

The annual public sitting of the Five Academies of the Institute, viz. the Académie Française, the Académie des Inscriptions et Belles Lettres, the Académie des Sciences, the Académie des Sciences, Morales, et Politiques, and the Académie des Beaux Arts, took place on the 2d of May: M. Huyot, the eminent architect, and member of the Académie des Beaux Arts, in the chair. His opening discourse turned upon the mutual advantages and encouragements caused to each other by all the branches of science and art. M. Jaubert, of the Académie des Inscriptions, then gave an account of several works sent in to compete for the Linguistic prize, founded by Volney. The gold medal proposed was not awarded, and only "honourable mention" was decreed to each of four essays. One of these, M. Fallot's "Researches on the Grammatical Forms of the French Language in the Twelfth Century," was spoken of in terms of considerable praise. Notice was given of a gold medal for 1841, for the best essay on Comparative Philology; and instructions were issued not to make it too exclusively devoted to general grammar, but rather to the historical analysis of various languages, or dialects: the essays to be sent in before 1st March, 1841. M. Volney's gold medal for the application of the Roman alphabet, with some accessory signs, to the transcription of Hebrew, and all the related languages, comprising also Ethiopic, Persian, Sanscrit, and Chinese, was declared to be still open.—M. Raoul Rochette, perpetual Secretary of the Académie des Beaux Arts, read an eloquent *monceau*, entitled "Des Encouragements aux Arts," being part of an extended work on the Fine Arts, considered in their connexion with national manners among the ancients and the moderns. The learned author attributed the fact of art existing without public succour in ancient days to the circumstance of its being used as a main accessory of religion, and employed chiefly in the decoration of temples; whereas, in modern times, the largest application of art was to purposes of private luxury and domestic life. We confess ourselves that

the professor's arguments do not appear to us very conclusive.—The Viscount le Prévost d'Iray, of the Académie des Inscriptions, read a long and exceedingly dull poetical translation of a fragment of Sallust's "Jugurthian War."—He was followed by Professor Blanqui, of the Académie des Sciences, Morales, et Politiques, who read an interesting and highly eulogistic notice of the life and labours of Mr. Huskisson.—M. Viennet then read to the assembly three new fables of his own composition, the latter of which we thought particularly good; it was as follows:—

#### "La Queue des Singes."

Dans Simipolis, des singes capitale,  
Par une mort prompte et fatale  
Venaient d'être emportés les deux bouffons du roi.  
C'était, chez la gente grimacière,  
Un poste de faveur, un éminent emploi.  
Une façon de ministère.  
Trois partis le briguaient, et le peuple en émoi  
Attendait le succès de cette grande affaire.  
Les pongos, les loris, les magots, les gibbons  
Présentaient deux jockos dont ils prônaient d'avance  
Et la souplesse et la science.  
La plus forte de leurs raisons,  
C'est qu'ils étaient sans queue, et que cette excoissance,  
Cet excédant de poil et d'os  
Ce vain prolongement de l'épine du dos  
Attestait une étroite et lourde intelligence.  
Les guenons et les sapajous.  
Les talapoins et les malbroucks.  
Singes à longue queue, affirmant au contraire  
Que, pour avoir du goût, de l'esprit, du talent  
Une queue était nécessaire;  
Que même le mérite était à l'avenant  
De cet *incrémentum* de la moelle épinière;  
Et deux makis, dont cette faction  
Appuyait la candidature  
Proclamaient hautement que, sans cette parure,  
Un singe n'était plus qu'un méchant embryon,  
Un monstre, un erreur de nature.  
Un troisième parti lutait des quatre mains  
Pour deux mandrils à face bleue.  
C'étaient les papillons, malmons et babouins.  
Ils ne contestaient pas le besoin d'une queue;  
Mais la leur était courte, et leur avis était  
Que des excès en tout il fallait se défendre,  
Qu'en un juste milieu le sage se tenait;  
Et les mandrils étaient, à les entendre,  
Les candidats qu'il fallait prendre.  
Le roi, qu'embarrassaient leurs contraires avis,  
Les prit l'un après l'autre, et, comme le pays,  
Reconnut qu'une fois investis de leurs places,  
Les mandrils, jockos et makis,  
Faisaient tous les mêmes grimaces.  
Tels sont du pôle arctique aux champs des Patagons,  
Les partis et les coteries.  
S'agit-il d'un fauteuil dans nos académies,  
De ministres ou de bouffons,  
Chacun pousse les siens, siffle ses adversaires,  
Promet beaucoup et tient fort peu.  
Le train du monde n'est qu'un jeu  
De charlatans et de comètes;  
Ce qu'on appelle queue à Simipolis,  
Ils le posent ici programmes ou systèmes;  
Mais leurs grimaces sont les mêmes,  
Et les plus amusans ne sont pas à Paris."

M. Cauchy, the eminent mathematician of the Academy of Sciences, was to have terminated the sitting by the production of a phenomenon, or *lusus naturæ*, never before witnessed—an epistle in verse of his own composition, "From a Mathematician to a Young Poet;" but time ran short, and the assembly had to break up before this worthy and much-esteemed gentleman could deliver himself of his Pegasus labours.

M. A. Jubinal, Professor of Foreign Literature at Montpellier, has just received the cross of Isabella the Catholic from the Queen of Spain, for his learned work on the royal armory at Madrid.—The King of the French has conferred the decoration of the Legion of Honour on Manzoni, the author of the "Promessi Sposi."—The papal government has just put M. Michelet's "Life and Memoirs of Luther" on the Index; this is what they call *progress* at Rome!

*Books.*—Victor Hugo's "Les Rayons et les Ombres," a new volume of poetical fragments, was published this morning; it is said to be quite equal to any other poetry he has written.—M. de Lamennais is understood to be on the

point of publishing a philosophical work, on which he has been engaged for several years; three volumes of it are said to be nearly ready.—A picturesque edition of Sismondi's "Italian Republics" is now coming out in numbers; we are not surprised at this, the works of this great historian being among the chief literary monuments of our day.—A very useful work of reference for French historical students is now in course of printing, being a reissue of the early portion of the "Moniteur" newspaper, the official paper from the first outbreak of the Revolution till the end of the Directory. It is to be thus divided:—Constituent Assembly, in 9 vols.; Legislative Assembly, 4 vols.; National Convention, 12 vols.; The Directory, 16 vols. It is to appear in cheap parts.—The most important original book that has issued from the French press for some time is Baron Walckenaer's "Life and Times of Horace;" it displays a great deal of sound and elegant scholarship, and will, no doubt, soon become known in England.

*Sciarada.*

Il primiero ed il secondo  
Sono odiati in questo mondo:  
Ma il secondo ed il primiero  
Ma non entrava nell' intiero.

Answer to the last:—Poli-fonte.

## LITERARY AND LEARNED.

### ROYAL SOCIETY.

MR. LUBBOCK in the chair.—A paper addressed to Mr. Faraday was read. It was 'On the Odour accompanying Electricity, and on the probability of its belonging to a new substance.' The phosphorous smell here alluded to is identical with that produced by lightning and the voltaic current; but it is remarkable that it is only found at the negative pole, and depends upon the metal. Gold, for example, and platinum, yield the odour more readily than the oxidisable metals.—Read, likewise, a paper, third series, 'On the Ova of Mammalia,' by Dr. Barry. The author had collected many ova from the Fallopian tube of the rabbit, and examined them with powerful lenses. His valuable details are only fit for a medical work.

### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Civil Engineers, 8 P.M.; Zoological, 8 P.M.; Medical and Chirurgical, 8 P.M.; Society of Arts (Illustration), 8 P.M.  
*Wednesday*.—Society of Arts, 7 P.M.; Geological, 8 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund, 3 P.M.  
*Thursday*.—Royal, 8 P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Friday*.—Royal Institution, 8 P.M.; Botanical, 8 P.M.  
*Saturday*.—Electrical (Anniversary), 8 P.M.

## FINE ARTS.

### ROYAL ACADEMY.

It must be gratifying to the lovers of the Fine Arts, and to the encouragers of native talent, to hear that it is the general opinion (in which we entirely concur) that the present Exhibition of the Royal Academy is the best which has appeared since the removal of that body from Somerset House. There is not only a manifest improvement in many of the individuals whose works adorn the walls, but there are more subjects of general interest than, we think, on any former occasion. Among the first in point of talent and attraction stands

125. *Milton Dictating to his Daughters*. Sir A. W. Callcott, R.A.—The subject has been often and variously treated by different artists; but, with reference to the present performance, we should say that its excellence is such as to deter any one from again attempting the same

theme. The appeal is to the heart; it is irresistible; and the sympathy of every beholder must be strongly excited towards the venerable and immortal bard. As a work of art, the simplicity of its design and execution is another powerful charm in this admirable production, which is calculated long to dwell upon the memory of those who have seen it.

174. *Banquet Scene in Macbeth*. D. MacLise, R.A. Elect.—We cannot offer a more striking contrast to the above, in every respect but talent, than this striking performance. Violence is its characteristic feature; and the expression of terror was never carried further than it is in the countenance of Macbeth. The ghost of Banquo is seated in a chair with its back towards the spectator; torch-bearers are in advance, but, though close to the object, are looking past it with the greatest alarm. The figure of Lady Macbeth is also prominent, and crowded guests, plate, and other glittering accessories, fill the canvass to repletion. But we must follow Mr. MacLise into the Middle Room, where the comedy of art is carried on with great success, in 381. *Scene from Twelfth Night*.—In the figure of Malvolio, folly has reached its climax; in that of Olivia, there is a quiet dignity and exquisite beauty, admirably contrasted by the fun and mischief in the countenance of Maria. We understand the picture is painted for Robert Vernon, Esq.; and we shall be happy to see so fine a specimen of the artist's powers in the collection of so liberal an encourager of native genius.

The numerous examples of art which meet our eye oblige us to be excursive, and warn us to be select. In his own peculiar walk Mr. Edwin Landseer has given us, 139. *Macaw, Love-birds, Terrier, and Spaniel Puppies belonging to her Majesty*.—He has grouped them with his usual felicity. The macaw, on his perch, is regaling himself with a biscuit, and manifests all the gravity and enjoyment of an epicure. While the terrier plays the beggar at the foot, a spaniel is playing with a feather of the bird above, and the whole stands out in bold relief on a light ground. In 311. *Laying down the Law*, by the same masterly hand.—A white French poodle (which we have seen, with much pleasure, in real life) in the centre enacts the judge; books, paper, and spectacles, are spread on a table before him, and he is surrounded by dogs of every kind and class, while a sharp terrier is, with his keen and intelligent look, addressing the court. In looking at this performance we could not—and why should we?—restrain our laughter, and we pity those who can see it unmoved to mirth.

292. *The Dromos, or Outer Court of the Great Temple at Edfou, in Upper Egypt*. D. Roberts, A.—We had fed our expectations with something extraordinary from the pencil of this truly able and adventurous artist, and we have not been disappointed. Different in form, colour, and effect, from any thing the English eye has been accustomed to contemplate, this vision of past ages is calculated at once to excite our admiration and to fix our attention. Another of Mr. Roberts's fine productions is 190. *The Greek Church of the Holy Nativity at Bethlehem, erected over the Stable of the Nativity by the Empress Helena*; but, with the associations connected with the humble birth of Christ, it is noways different from other gorgeous structures, whose ornaments and decorations form a striking contrast to the life and death of Him to whom they are consecrated. As a work of art, however, it is rendered highly interesting by its beautiful treatment.

10. *The Reduced Gentleman's Daughter*. R. Redgrave.—The subject is from the "Rambler," and is illustrated by the artist with great feeling. The occurrence, we fear, is too common, but the painter does his duty when he thus "holds the mirror up to nature;" and if he only mitigate the condition of one helpless dependent female, he will have his reward.

21. *Nell Gwynne*. C. Landseer, A.—This is truly a notable contrast to the above. Attractive in person, licentious in character, an object of attention to the witty and the profligate, and at last the favourite of a monarch and a gem of his court. How different from the fate of those who steal through life in virtue and obscurity! But we stop our sermonising to commend the talents of the artist in the execution of his task, and the personal beauty with which he has invested his principal character.

26. *Andromeda: Perseus coming to her Rescue*. W. Etty, R.A.; and 30. *Mars, Venus, and Attendant derobing her Mistress for the Bath*, by the same Artist. We have no remark for these pictures, but that with all their ability they are wholly unfit for a public exhibition.

31. *King Henry the First of England receiving Intelligence of the Shipwreck and Death of his only Son*. S. A. Hart, R.A. Elect.—In this, as well as in other of his performances, the artist has shewn himself well qualified for historical composition. The grief of the monarch, and the way in which the sad tidings are conveyed, are at once touching and original. The scene is well filled, and the interest kept up throughout.

41. *Stacking Hay*. W. F. Witherington, R.A. Elect.—Oh, what life, light, and freshness, does this charming picture exhibit! While the sense of sight receives its full share of gratification, rural associations of the most pleasing nature are awakened in the breast.

48. *Benvenuto Cellini presenting for the Approval of Pope Paul the Third a Silver Censer of his own Workmanship*. Sir. D. Wilkie, R.A.—And if the pope had ordered him to be hanged afterwards, Benvenuto would richly have deserved the fate, if what is related of him be true. Certain it is that the love of art in the pontiff and the skill of Cellini prevented such a catastrophe. There is nothing in the subject to excite much interest, except the character and expression depicted in the countenance of the pope.

[To be continued.]

[At the Royal Academy dinner, on Saturday, the usual loyal and artistical toasts were given; but we were particularly desirous to hear what was said by the French Ambassador when his health, together with the rest of the diplomatic body, was drunk. By the kindness of a friend, we have been enabled to translate the eloquent address of this distinguished statesman and author. M. Guizot spoke as follows:—]

MR. PRESIDENT, Gentlemen.—The diplomatic body is deeply touched by your noble and kind hospitality, and I am happy to have at this moment the honour of being the organ of its sentiments of gratitude and sympathy. Nowhere, in truth, are they more natural, or better placed, than on this spot and at this solemnity. Many ages ago, when the Emperor Vespasian conceived the design of assembling in one place all the *chefs-d'œuvre* of the arts which conquest had brought together in Rome, he chose the Temple of Peace. He wished that all the peoples, forgetting their ancient enmities, might enjoy together this fine spectacle. Nothing agrees better than Peace and the Arts. There is between them a natural and powerful harmony. Whoever may

doubt it, has only to cast his eyes on what has passed in Europe during the last twenty-five years. It cannot be said that these years have been for the Arts an epoch of grand and original creation, nor that they have produced many of those new *chefs-d'œuvre* which render an age illustrious among ages. Yet the intelligence and taste for the arts have been spreading, have penetrated into places, among men who hitherto had been strangers to them. In traversing Germany, France, and also, without doubt, England, we see rising every where, in the provinces as well as in the capitals, a crowd of monuments, great or small, ambitious or modest. The statues of the great men come to people the public resorts. If any exhibition analogous to the present is any where opened, the crowd runs to it. Painting, sculpture, music, all the arts, enter into peoples' tastes, into their manners, and become almost popular. This is a great blessing, gentlemen, at our epoch, and in the state of modern society. What would you do, what should we do, in all our countries, with all these men,—these millions of men,—who are incessantly rising to civilisation, to influence, to liberty, if they were exclusively given up to the thirst of material prosperity and to political passions? If they dreamed but of enriching themselves, or of counting about their privileges with their fellows? They need other interests, other sentiments, other pleasures. Not to turn them from the amelioration of their condition and from the progress of their liberties; not that they should be less exigent (*exigeants*) and less proud in social life; but, on the contrary, to render them capable and worthy of their more elevated condition—capable and worthy to carry higher in their turn that civilisation towards which they mount in crowds. And, also, to satisfy in them those *penchants*, those instincts of our nature, which are satisfied neither by material prosperity, nor even by the works and spectacles of political liberty. Like literature and the sciences, the arts possess this virtue: they open to the activity and enjoyment of men a fair and wide field; they spread pleasures which are brilliant and pacific; they at the same time animate and calm men's minds; they soften our manners without enervating them; they bring together and unite, in one common enjoyment, men who are otherwise very different in situation, in habits, in opinions, in desires. It is not, therefore, for yourselves alone, gentlemen, for your own pleasure only, that you cultivate and encourage the arts. The Royal Academy, its institution, its exhibitions, have a greater aim, a merit truly social. We congratulate ourselves on being associated to-day in its solemnities. We sympathise in its labours and its hopes. In such a meeting, in presence of these *chefs-d'œuvre*, under the influence of the sentiments which they inspire in us, we are your guests, gentlemen; but there are no strangers here.

SOCIETY OF PAINTERS IN WATER-COLOURS.  
[Second notice.]

177. *MASTER ISAAC WALTON*. W. Hunt.—Draw as we may for character and expression on Mr. Hunt, he will honour the draught to any amount the subject will admit of; nothing can exceed the eagerness, and at the same time watchfulness, which the young angler's look expresses while bending over his line: so intent indeed is he, that from his situation on the perpendicular fence on which he sits, it may be expected that the twitch he gives to secure the prey, will precipitate him into the

stream. 321. *Interior*, by the same.—There never was, and we will venture to say there never will be, a more perfect effect of truth and daylight, than is seen in this performance. Every object is relieved by its local colour; the bed, the toilet, the window, all appear just as they would in nature.

180. *View of the Abbey Church of St. Denis, near Paris*. F. Mackenzie.—To the careful execution and fidelity which always distinguish the works of this able artist is added a magical effect of light and colour on the figures in the fore-ground, which produces an admirable relief, and sets off the chastened tone of the beautiful structure towering above.

141. *Eton College*. W. A. Nesfield.—The interest of such scenes is necessarily enhanced when they awaken associations of school-boy days; but the view before us wants no recommendation from those or any other extrinsic feelings. It is a picture of light and beauty that must be gratifying to all who can derive pleasure from such combinations of art and nature.

247. *Eton*. W. Evans.—A more confined view of the same place; it is here seen through an opening of trees, which serve as a framework, and give interest to the spot they embellish.

198. *Fruit*. V. Bartholomew.—An admirable composition, consisting of fruits the most beautiful of their kind, surrounded by objects which harmonise with the colour under which they appear. In its execution, the present is one of the most perfect productions of this very distinguished artist. In this department of art Mr. Hunt also has many very masterly studies. Among them we were particularly struck by 43, *Fruit and Flowers*, &c., as most brilliant and sparkling.

289. *Autumn: Highlands of Scotland*. Frederick Taylor.—The artist has imparted to the two female rustics (the principal objects in his picture) a degree of grace and simplicity, which, whether natural or acquired, has charms beyond those of any meretricious or expensive ornament in costume.

267. "*A Page in Waiting*," by the same, exhibits a scene in a higher, perhaps one of the highest, grades in society, and in which diligence and the display of courtly craft might be expected. In the boy page here represented, however, nothing of that kind appears: weary with "waiting," he has fallen asleep; but a watchful hound is near him, and the youngster seems to have presumed upon the vigilance of the faithful animal.

281. *The Young Giraffe born at the Zoological Gardens, taken within Twelve Hours of its Birth*. R. Hills.—We are glad that so curious, rare, and interesting a subject should have come under the pencil of this truly able artist, alike faithful in his delineation of wild or of domestic animals. In the present instance the result is highly satisfactory. Mr. Hill's views of English pastoral under its various forms will be found, with his usual labour and finish, in 55, *Farm-Yard*; 73, *Farm-Yard*; 37, *Fallow Deer*, and other works of equal interest.

248. *At Venice*. J. Holland.—As we write the words "Venice" and "Holland," it seems as if we meant to bring into juxtaposition ideas as ill-assorted as gaiety and gloom:—but this is foreign to the subject. We have in the performance under our notice a fine display of elegance, taste, and originality in composition, of harmony in colouring, and of spirit in execution. It is very simple in its treatment. Two females

of high rank are represented as walking on the terrace of their palace, a portion of which appears on the right, and in the distance a part of the city is seen. Although this performance tells no tale, its qualities, as a work of art, are abundantly sufficient to recommend it. Another splendid production by the same artist is 201, *Piazza Signori, Verona*.

225. *The Old Pier at Burlington*. Copley Fielding.—Darkness and danger invest the scene. With the splashing waves breaking over it, we should think it as hazardous to tread

"As to o'erwalk a current roaring loud  
On the unsteady footing of a spear,"

and all we can say of the Old Burlington Pier is, that if it be in such a state, it is time there was a new one. But for the sublime in horror and desolation, depicted with extraordinary power, we refer to 13. *A View of the Island of Staffa*, by the same artist. Strange as the coincidence may appear, immediately below this tremendous scene is placed

14. *Richmond Hill*. W. Scott.—In which all is tranquil beauty. No contrast could be more striking, or more advantageous to both productions.

23. *A Forest*. D. Cox.—The scenic character of this performance is grand and imposing, and almost exclusively picturesque. Trees, the growth of ages, bending to their fall, spreading their branches right and left in decaying grandeur, impress the imagination with feelings of awe and mystery, and not unfrequently awaken ideas of peril and adventure. As a work of art this is an admirable example of the high talents of the painter.

[To be continued.]

NEW SOCIETY OF PAINTERS IN WATER-COLOURS.

[Fifth and concluding notice.]

244. ———. Edward Corbould.—The verse of an old English ballad has furnished Mr. Corbould with a subject at once of the beautiful and of the grotesque: for truly we may say of the mendicant part of his picture, there are forms of voluptuous beauty in some of the females that might grace a Turkish harem, while the dog, monkey, and sturdy beggar, might figure as drolls in farce or comedy. 256. *Rombrandt Studying an Effect*. E. H. Wehnart.—Is in itself a very clever picture, and with good character in all its qualities, but it is drawing too much on the imagination for that which is entirely out of sight. 262. *Margaret Ramsay and Lord Glenvarloch in the Tower*. John Absolon.—One of the most interesting scenes in "The Fortunes of Nigel," and embodied by the artist with great skill both in character and in chiaroscuro. 279. *The Last Man*. W. N. Hardwick.—The wreck and the raft thus represented are too dreadful to contemplate, it is death in its most appalling shape: like the martyrdoms of old, from the pencils of the first masters, the better such subjects are painted, the more painful they are to look upon.

283. *Village Fair*. G. H. Laporte.—A busy scene of life and joy is here presented to the sight. Both in general character and in individual circumstances, it abounds with objects of interest. One very striking feature is a grey horse, offered for sale, which in its drawing and beauty would not discredit the pencil of Wouvermans, or any other artist distinguished in the same line of art. 294. *Der Goldschmidt*. Henry Warren.—Our only regret with respect to this beautiful and tasteful gem of art is that it was not executed on a larger scale. The

subject is pleasing, it represents a young man encircling the head of a female with a coronet or diadem: the scene, a goldsmith's shop with all its glittering and costly temptations.

We regret that our limits and the pressure of other matter will only allow us to add the numbers and names of a few more of the works of talent in this interesting exhibition which dwell in our memory; as 164. *The Lady's Chapel, York Minster*, J. S. Prout; 179. *St. Werner's Chapel, Oberwesel, on the Rhine*, R. K. Penson; 194. *The Miniature, F. Rochard*; 230. *Interior Composition*, J. Kearns; 130. *Candle-light Effect*, T. S. Robins; 103. *Lowestoff Lighthouse, Suffolk*, G. S. Shepherd; 116. *Expectation*, L. Corboux; 129. *Rue de la Tuile, Rouen*, T. S. Boys. Others by Finninger, Maisey, Sims, Oliver, &c. &c. are subjects of attraction and worthy of attention with those already named; and we now take leave for the present year of the New Society of Painters in Water-Colours, with every good wish for their success, and for the just remuneration of their labours.

#### BELGIUM AND GERMANY.

WE have before us two specimens of "Pictorial Sketches in Belgium and Germany, by Louis Haghe, Esq.," about to be published by Messrs. Hodgson and Graves; and certainly any thing more exquisitely beautiful in any style of art, any thing so exquisitely beautiful in lithography, never before met our eye. But we will postpone particular notice of these charming prints until the whole volume comes into our possession.

#### MANIONS OF ENGLAND IN THE OLDEN TIME.

MR. McLEAN is about to publish a second series of Mr. Joseph Nash's admirable work under the above title. Three specimens lie on our table; but, at present, we shall only say of them (and it is high praise) that they are worthy of their predecessors.

#### NEW PUBLICATIONS.

*Interior View of Longstone Lighthouse, at the Fern Islands.* Engraved by C. G. Lewis, from the Original Picture painted on the spot by H. P. Parker. Ackermann and Co. The circumstances attendant on the wreck of the Forfarshire steam-ship in September 1838 have been too frequently brought before the public, in one shape or another, to render it necessary for us to say more on the present occasion than that this racy and vigorous print, which does great credit both to the painter and to the engraver, represents the kind reception and treatment of the survivors immediately after their rescue. It comprehends portraits, painted from life, of Grace Darling, and her parents; and all the little ornaments and accessories of the scene have the appearance of being faithfully indicated.

*The Young Chief's first Ride.* Painted by F. Tayler; Engraved by S. W. Reynolds. Ackermann and Co.

WHAT happiness can be more pure and perfect than that which swells the breast and laughs in the eyes of this fair and noble child; who, besides his immediate enjoyment, is, no doubt (for we are sure he is an imaginative boy), anticipating with delight the period when, released from the cautious hand which now stays and guides his steps, he shall be foremost in the hunt, the race, or the charge? The shaggy Highland pony, the back of which his tiny limbs can scarcely bestride, his affectionate

and vigilant attendant, the majestic hound stalking by his side, the coupled whelps frolicking in his path, and the wild mountains which surround him, all contribute to the effect of this interesting composition. The remarkably loose and playful style of Mr. Tayler's execution must throw great difficulties in the way of an engraver; and therefore the more praise is due to Mr. Reynolds for the masterly manner in which he has acquitted himself of his task.

*Banditti Disputing.* Painted by G. Cattermole; Engraved by T. Lupton. Ackermann and Co.

ALAS! what a contrast! Is it possible that the innocent, gay-hearted, little creature we have just described, can belong to the same species as the gloomy, vindictive, ferocious beings whom Mr. Cattermole has here grouped with so much skill and effect?

#### Findens' Royal Gallery of British Art. Part V.

Or the great variety of graphic publications that come under our notice, there is no one the appearance of a number of which on our table we hail with more satisfaction than "The Royal Gallery of British Art," anticipating as we always do, and have never yet done in vain, the highest gratification from an examination of its contents. As usual, the plates in the present part are three in number. "A Contadina Family, Prisoners with Banditti," painted by C. L. Eastlake, R.A.; engraved by E. Smith.—Although ten years have elapsed since this interesting composition was exhibited at Somerset House, we have no doubt that it remains vividly impressed on the memory of many of our readers. Indeed it would be difficult to forget the piety of the mother, the self-abandonment of the father, the shrinking modesty of the daughter, and the licentious gaze of the ruffian-guard. The varied expression of the group, and the concomitant circumstances of the scene, have been rendered by Mr. Smith with perfect fidelity, and in an exquisitely elegant and finished style of engraving. "Sir Roger de Coverley and the Gipsies," painted by C. R. Leslie, R.A.; engraved by C. Rolls.—Although we have seen works from Mr. Leslie's pencil which we have liked better, there is much piquancy in this personification of Addison's "Good Old Knight." Mr. Rolls has done it great justice. "View on the River Stour, near Dedham," painted by John Constable, R.A.; engraved by W. R. Smith.—It is no impeachment of Mr. Constable's colouring, but the reverse, to say that his performances always look well when reduced to black and white; for the fact shews that he took care to proceed on a solid foundation. It was of this picture that, when it was exhibited in the Louvre in 1824, a French artist is reported to have said to a friend whom he called to look at it,—"*Venez ici donc; voilà ce paysage par un artiste Anglais: c'est plein de la rosée.*" Mr. W. R. Smith has been very successful in preserving the breadth of the masses, without sacrificing the peculiarities of the detail.

*His Majesty, Mahommed, Shah of Persia.* Painted by J. H. Twigg, Honorary Painter to his Majesty; Engraved by J. E. Coombs. Welsh and Gwynne.

THE peculiar circumstances of the East render this well-composed and firmly-engraved portrait of the Persian monarch especially interesting at the present period. The Shah is represented seated on his throne. The expression

of his countenance is pleasing and intelligent, and his costume is splendid.

*The Landing of Mary, Queen of Scots, at Leith, in 1561.* Painted by W. Allan, R.A.; Engraved by J. G. Murray. Mrs. Parkes, Golden Square.

THIS pretty little print has been published some time, but we do not recollect having noticed it. It is full of animation and elegance.

#### THE DRAMA.

*Her Majesty's Theatre.*—The managers followed the course we pointed out to them, as the only one by which they could get out of the difficulty into which their cupidity and want of good faith had plunged them. Tamburini has been engaged, and appeared; and so the row is done, and a right lesson taught the lessees.

*Haymarket.*—On Monday, Fitzwilliam's benefit was what we anticipated it would be, and what so meritorious a public favourite deserved—a bumper. The entertainments were full of variety and amusement.

On Wednesday, a new piece by Mr. Bernard, called *The Irish Attorney*, gave Power another opportunity to display his talent in Irish character. It is an amusing picture of a frank-hearted, joyous Hibernian, united in legal practice with a Yorkshire partner (Strickland), and whose eccentricities and breaches of all professional rules, instead of ruining the concern, turn out to its advantage. The consequence is that the northern sharp, instead of desiring to get rid of him, becomes desirous of a reconciliation, and all differences are satisfactorily composed. The acting was excellent, and the piece completely successful.

*The Adelphi* closed on Wednesday, somewhat before the usual term, as it appears from Mr. Yates's farewell address, because it had become necessary to rebuild the front of the theatre. The season was stated to have been fairly prosperous, and the lessee promised to employ the vacation (as all his past exertions to please afford us assurance he will) in doing his utmost to prepare novelties for the entertainment of the public.

*German Theatre.*—On Thursday, *Fidelio* was performed; in which Madame Fischer Schwarzböck played *Fidelio*, and greatly overacted the part, but was in several parts very effective. The tenor, Florestan, was very sweet; and, with the exception of the women in the choruses, who are too shrill, these parts of the opera were excellent. The rest of the characters were well filled, and the overture quite beautiful in its execution. In the body of the house, a system of the rankest extortion and depredation, added to the utmost impertinence, is carried on by the box-keepers. Unless these worthies are bribed, there is no chance of accommodation; which is exactly measured by the extent of the fee, though many seats are unoccupied. It is the most disgraceful thing ever witnessed in a theatre; and wherever it exists it justly thins the audience, who will not go again to be robbed and insulted.

*Mr. Doulton.*—A benefit for this veteran and popular artist is announced for June 8th at the opera, and under such auspices as must command a generous subscription: such, we trust, as will gild his later years.

*Hanover Square Rooms.*—On Monday, Mr. Carte and Mr. Henry Hayward gave a grand concert, which was well attended. The novelty of the evening was an oratorio, "David's first Victory," written and composed by Miss Mary

Linwood. Of this it is only necessary to say, it contains many sweet and feeling passages; many, also, of great spirit: but, as a whole, we fear it will not become a standard oratorio. We could select passage after passage denoting fine taste and much cultivation in the writer, at the same time we are ungallant enough to express our opinion, that it is not for woman's head or hand to produce a sacred oratorio. The second part consisted of a selection of miscellaneous music. Miss C. Novello sang the "Rising of the Lark," accompanied by Mr. Carte on the flute, and "Casta diva," in charming style. Mr. Henry Hayward delighted us much by his Venetian barcarolle: he is one of our most promising violinists.

*Societa Armonica.*—The third concert, on Monday, was one of the best of the season. Grisi and Lablache were the vocal stars.

#### VARIETIES.

*The Literary Fund* observes its anniversary on Wednesday, with Sir Robert Inglis in the chair, and a good list of stewards; so that a full and beneficial meeting may be anticipated. There is no charity in the world which more deserves the general support of the public.

*Artists' Benevolent Fund.*—The anniversary of this day bids fair to do as much for this excellent Institution as was done for its compeer a few weeks ago. It is, indeed, an occasion round which artists and their friends ought to rally.

*The Dilettanti Society.*—We have just had an opportunity of looking over the last production of this Society, viz. Part III. of "Ionian Antiquities;" and it is certainly a superb and delightful volume. The very numerous engravings are admirably executed, and the letterpress descriptions display an extraordinary amount of profound research and classic learning. The subjects are, Cnidus, with its beautiful site, and the exquisite proportions of its architectural remains;—Aphrodisias (the more ancient Ninoe); and Patara, of which the vignette is extremely fine. Looking upon these, how forcibly does the pathetic eloquence of Cicero rush upon the mind! and how, in a more direct and particular manner, do they recall the buried and extinct glories of Lycia and Caria! The elegance and luxuries of a highly polished people are impressed on every stone that remains of their temples and theatres; and, especially as regards the latter, we are forced to observe in what consideration they were held by the nations of antiquity long before "Romeus was an actor at Rome." Sir W. Gell and Mr. G. Deering are the chief contributors to this striking publication, but the whole must have been diligently studied by persons of the greatest reading and information, to have enabled the Society to issue a book so full of matter interesting to the arts, to history, and to a correct acquaintance with the habits of life, institutions, and opinions of these early sections and colonies of mankind.

*Royal Exchange.*—Mr. Tite has been elected to build the Royal Exchange. The competition came to a vote in the City, and he had thirteen votes to seven against Mr. Cockerell, R.A.

*The Camden Society* held its annual meeting on Saturday, Mr. Amoyt, the able director, in the chair.—The council and officers for the ensuing year, were elected; and from a report of the past, made by Mr. Thoms, the Secretary, we are glad to find that the Society is going on successfully. Its publications have far outstripped in value the amount of the subscription, and the selection has done great credit to the taste and judgment of the selectors, as well as to the ability and learning of the editors.

*College of Civil Engineers.*—This new college has been opened under high auspices, and a profession which is every day rising in importance, as mechanical improvements and great national works make progress amongst us, has thus, at any rate, commenced a school which, if ably conducted, must produce very beneficial consequences.

*St. George's Hospital.*—The distribution of prizes took place on Monday, in the anatomical theatre belonging to this hospital, Sir C. M. Clarke presiding. In presenting the successful candidates with various books, medals, &c., he alluded to his once having been a student at St. George's himself, and complimented the scholars generally for their attention to their studies. The theatre was extremely well attended on this interesting occasion.

*H.B.'s.*—A new word might be invented for these caricatures, as for example, *Aitchbees*. Here are no fewer than four new ones, Nos. 634, 5, 6, 7. First, "Cupid taming the Elements," a hit at the foreign secretary, with nearly all the nations of the world in shadowy arms against him; next, "Apollo and the Muses," a mythological representation, in which O'Connell is the harper, and the principal members of the cabinet the fabled Nine—a very amusing design; third, "Playing at Ninepins," in which seven of the aforesaid muses take the novel form of the pins; and Sir James Graham is bowling, with Stanley keeping the score. The majority on the Irish Registration-bill is marked up. The last is "Chinese Jugglers," a whimsical sketch, ridiculing the *lengthy* papers given to parliament on the subject of the Chinese war.

*John the Baptist's Locusts.*—When the locust-tree is named, and its pods said to be a palatable article of food, an impression is very commonly made on the mind of a hearer, who has forgotten his Greek, that this vegetable locust must have been the food on which, with wild honey, John the Baptist lived in the wilderness; and people often lament their stupidity in having ever supposed that it could have been a nasty insect—but such it was—*ἡ δὲ τῆς ἀκρίδος τὸ σῶμα καὶ τὸ μέγεθος καὶ τὸ γένος.* "And his food was locusts (*akrides*) and wild honey." Bochart has proved that the insect locusts were eaten by many nations in Africa and Asia, both in ancient and modern times. There is, indeed, no doubt about the word *akris*, which means the insect; and the mistake has arisen from the English names alone. The word *אכריה*, *akreh*, or locusts of the Old Testament, is translated *akris* in the Septuagint Greek.

*Mr. Groom's Tulip Show.*—This superb exhibition of these gorgeous flowers at Wandsworth, on Wednesday, attracted a very numerous visitation; and nothing could excel their variety and beauty: some specimens were valued at a hundred guineas, and more.

*Zoological Gardens.*—Mount Hecla began its eruptions on Thursday, and with such force and fire, that the visitors were lost in amazement. As this exhibition takes place early in the evening (soon after eight o'clock), it offers a delightful lounge for the young and curious. The animals are in perfection.

*Sir Simon Clarke's Pictures.*—Messrs. Christie and Manson's Rooms were crammed yesterday for the sale of this collection, and the competition was very brisk for some of the best paintings. Rembrandt's Portrait as the Standard Bearer brought 800 guineas; and a small Karel du Jardin, "a bullock, an ass, and some figures in a landscape," of some sixteen or eighteen inches, no less than 930 guineas.

The sale proceeds to-day, and there are some noble productions of genius to come under the hammer.

*Mr. Shoberl* has been presented by the King of Belgium with a valuable gold snuff-box, as a token of his majesty's satisfaction with the work entitled "Prince Albert and the House of Saxony."

#### LITERARY NOVELTIES.

*German Literature.*—We see by a prospectus just received that Professor Hirsch, of Berlin, is about to resume his German Readings, of which we spoke so highly last year, at Willis's Rooms.

At the Royal Botanic Society's Rooms, in Pall Mall, a Series of Lectures on the Investigation, Culture, and Preservation of the Mental Faculties, commencing yesterday, is being delivered by William H. Crook, LL.D. &c. &c. A weekly Course of Six Lectures, beginning on Thursday last, on English Literature, from the earliest Period to the Close of the Eighteenth Century, by T. H. Browne, Esq. of Mellington, author of "Thoughts of the Times," is announced at the Marylebone Literary and Scientific Institution.

#### LIST OF NEW BOOKS.

Nicholson's Cambrian Travellers' Guide, 3d edition, revised and corrected by the Rev. E. Nicholson, 8vo. 2s. 6d.—Observations on the Diseases incident to Pregnancy and Childbed, by F. Churchill, M.D. 8vo. 12s.—Letter to Sir B. C. Brodie on Local Nervous Affections, by W. Goodlad, 8vo. 6s.—On the Proposed Alteration of the Scottish Poor-Laws, by D. Monypenny, 8vo. 2s.—Mrs. Stevens's Course of Prayers for Family Worship, 2d edition, 12mo. 3s.—Gregory Seventh, a Tragedy, by R. H. Horne, 8vo. 3s.—Democracy in America, Part II. by A. De Tocqueville, Vols. III. and IV. 8vo. 18s.—The Altcar Racing Calendar, 12mo. 5s.—Rudell's Modern French Grammar, 2d edition, 12mo. 6s.—Rudell's Original French Pronouncing Book, new edition, 12mo. 5s.—Buchanan's Christian Researches, new edition, 12mo. 3s.—Euripides Iphigenia in Aulide, 8vo. 6s.—The Standard of Catholicity, by the Rev. G. E. Biber, 8vo. 14s.—Treatise on Cancer, &c., by J. Müller, M.D. translated from the German, with Notes, by C. West, Part I. 8vo. 7s. 6d.—Chronological Tables of Universal History, folio, 11s. 6d. half-bound.—Roman Antiquities, by J. D. Foss, 8vo. 12s. 6d.—Smith's Selection of Leading Cases, Vol. II. Part II. royal 8vo. 10s.—Evangelical Synopsis, by J. Cobbin: New Testament, imperial 8vo. 25s.—Fulmer's History of the University of Cambridge, new edition, 8vo. 12s.—Sermons on the Sacraments, by H. Bullinger, new edition, 8vo. 7s. 6d.—Scripture Characters and Events, by the Rev. J. M. Hifferman, 12mo. 5s.—The English Mother, or Early Lessons on the Church of England, 12mo. 3s.—E. F. O'Beirne's Account of the System of Education, &c., at Maynooth College, 8vo. 6s. 6d.—The History of Jesus Christ in the Words of Scripture, edited by J. Russom, 8vo. 3s. 6d.—Hope on, Hope ever, by Mary Howitt, 12mo. 2s. 6d.—Breakfast-Table Science for Young People, 12mo. 2s. 6d.—Looking-Glass for the Mind, 20th edition, 12mo. 2s. 6d.—Preston's Illustrations of Masonry, by George Oliver, 15th edition, 12mo. 9s.—Popular Education, a Prize Essay, by the Rev. E. S. Fryce, fcap. 5s. 6d.—Justification as Revealed in Scripture, by J. Bennett, D.D., 8vo. 12s.—Lectures on St. John, 14, 15, and 16, by the late Rev. J. B. Patterson, 12mo. 6s.—Truth and Opinion, fcap. 3s.—Ford's Guide to the Lakes, new edition, fcap. 6s.—Mason's Help to Devotion, 2d edition, fcap. 5s. 6d.—The Overseer's Guide and Assistant, by C. P. Barrett, 2d edition, 12mo. 2s.—Practical Work on the Diseases of the Eye, by F. Tyrrell, 2 vols. 8vo. 36s.—Life of Socrates, translated from the German by Dr. G. Wiggers, with Notes, 12mo. 3s. 6d.—Plato's Apology of Socrates, Crito, and part of Phædo, with English Notes and Schleiermacher's Introduction, 12mo. 6s.—Law Relative to Merchant Ships and Seamen, by Charles Lord Tenterden, 6th edition, by W. Shee, royal 8vo. 30s.—Perpetuation or Extinction of the Ecclesiastical Jurisdiction, by T. Clark, royal 8vo. 9s. 6d.—The Liturgy Explained, by Mrs. S. Maddock, Vol. II. 12mo. 2s.—Outline of the History of Rome, by Mrs. C. de Haviland, 12mo. 3s. 6d.—History of Slavery, by E. Copley, 2d edition, 12mo. 6s.—Ernestine, or the Child of Mystery, 3 vols. post 8vo. 11s. 6d.—Tya's Legal Hand-Book: Personal Property, 2s.—The Last Days of a Condemned, from the French of Victor Hugo, by Sir P. H. Fleetwood, Bart., post 8vo. 7s. 6d.

In 2 vols. post 8vo.  
**MILITARY LIFE.**  
LIGHTS and SHADOWS OF  
Edited by Major-General Sir CHARLES NAPIER, K.C.B. &c.

"This work consists of two distinct narratives, written by two different individuals who served in the armies of France, and whose military recollections are here combined with an introduction and observations by Sir Charles Napier. In literary characteristics, these French writers immeasurably excel our English military authors. The Count De Vigny imparts to his narrative the interest of a romance, and Mr. Blaise has such a happy talent for the picturesque, that one might suppose he was telling some agreeable, half-historical tale, with the most consummate art of the poet and the artist. Mr. Blaise's portion of the work is the most sketchy and amusing; crowded with light and witty traits, and bringing before us so graphic a picture of life in the various vicissitudes of military experience, that it is possessed of a fascination which has rarely before been imparted to such subjects."—*Atlas*.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

In 1 large vol. 12mo. price 10s. 6d. boards,  
**A COMPENDIUM of RUDIMENTS in THEOLOGY;** containing a Digest of Bishop Butler's Analogy; an Epitome of Deane Graves on the Pentateuch; and an Analysis of Bishop Newton on the Prophecies.

In 1 large vol. 12mo. price 12s. 6d. in boards,

**THE CHRISTIAN EXPOSITOR;** or, a Practical Guide to the Study of the Old Testament. Intended for the Use of General Readers.  
By the Rev. GEORGE HOLDEN, M.A.

Though many Expositions of the Bible of great and deserved celebrity exist in our language, a Commentary sufficiently short to be read by those who have not leisure to consult learned works, yet sufficiently comprehensive to serve as a guide to the study of the Sacred Scriptures, appears to be still wanting. To supply this deficiency is the design of the present work, in which it has been the aim and study of the author to embrace, in a condensed form, such information as will enable the general reader to ascertain the real meaning of the inspired writers.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

Of whom may be had, by the same Author,  
**The Christian Expositor of the New Testament.** 2d edition, revised and improved, 12mo. 12s.

## REVIEWS OF NEW BOOKS.

*Three Years' Residence in Canada, from 1837 to 1839, &c. &c.* By T. R. Preston, late of the Government Service at Toronto. 2 vols. 12mo. London, 1840. Bentley.

No subject of the present day possesses greater public interest than the actual condition and prospects of Canada; and it is both agreeable and useful to add to our knowledge the views of an unprejudiced and intelligent person, who, without party bias, has himself enjoyed an opportunity of observing the one, and from it predicating with judgment respecting the other. Mr. Preston's volumes require no introduction; and before the reader has gone over twenty pages, it will be found that they recommend themselves. We pass, however, the account of a dangerous and disastrous voyage out, and come at once in *medias res*. Of the insurrection long in preparation, we are told—

"One palpable sign of the times, not to be mistaken, during the progress of the insurrection, was the waning influence of the Catholic priesthood over the minds of their hitherto docile flocks. Not only did the insurgents treat with contumely the remonstrances of the pastors to whose injunctions they had before been blindly subservient, but intimated to them, in many cases, that their interference might be attended with peril to themselves. This, however, so far from acting deterringly on the clergy, stimulated them to renewed exertion; for they knew and felt their interest as a body to be identified with the maintenance of British authority, which alone secured them in their possessions; while, on the other hand, they were no less sensible that, were the chain of their moral influence once broken, the success of their countrymen must entail upon them the same ruin and devastation that overwhelmed the clergy in France during the first revolution there. Just in proportion, therefore, as they became sensible of the real nature of their position, so did they direct their efforts to check the progress of the insurrection; and, upon the whole, they succeeded marvellously, considering the powerful reaction with which they had to contend. There were, nevertheless, many cases of defection in their own ranks, as was strikingly exemplified in the respective instances of the parish priests who were found combating on the side of the insurgents at St. Charles and St. Eustache; but, taken as a body, the French Canadian Catholic clergy remained ostensibly faithful to their allegiance; and, under such circumstances, it is scarcely worth while to inquire how far their national sympathies might have been enlisted on the other side had not their personal interests been at stake.

An individual instance of their mode of religious instruction is amusing. Mr. P. says,—

"Though lamenting the degrading bigotry and superstition inseparable from their state of ignorance, I have not been the less gratified at observing, in connexion therewith, the extreme propriety of conduct and demeanour which characterises them when congregated in their places of religious worship. I have, however, occasionally been much amused by the oddities

of some of their rural pastors when holding forth to them, in the vernacular, from the pulpit; and who, in their familiarity of style and diction, could not have been surpassed by any corresponding propounders of Catholicity to rural ears in even good old Ireland. I remember, on one very hot Sunday afternoon, strolling into a village church, when the *prédicateur*, a little, short, punchy man, whose rubicund countenance, just peering from above the pulpit, exhibited every symptom of an inherent aversion to Lent, was holding forth with great vehemence and gesticulation, the perspiration running the while copiously down his cheeks. Having concluded a long peroration, he was beginning a new sentence, commencing, '*Jésu Chree*,' (*Jésus Christ*), '*mes enfans, vous savez*;' when, observing the church-door to be open, which, besides admitting air, also admitted the noise of some urchins from without, he suddenly vociferated, '*Fermez cette porte là, que*—' From his manner I really apprehended he was going to add *diable*, but he left the sentence unfinished, and resumed his discourse with '*Vous savez, mes enfans, que Jésus Christ a voulu—a voulu, je vous dis*.' He had now, however, either from the interruption or the heat, or from the combination of both causes, quite lost the thread of his discourse, and could evidently proceed no further; whereupon, far from being abashed, he took out his snuff-box, still pronouncing, with a pause between almost every letter, the words '*Jésu Chree*;' helped himself to a lengthened pinch; deliberately raised his small black tongs; wiped his reverend face and forehead, and exclaimed with the utmost simplicity of manner, looking very complacently around him, '*Il fait bien chaud, mes enfans*.' The whole scene was inexpressibly ludicrous. The perfect ease and nonchalance of the preacher; his strange appearance; the mixture of the holy with the profane; the singular conclusion; but, above all, the reiteration of the Saviour's name in association with the snuff-box, so played in combination upon my risible propensities, that I was compelled, in the excess of my heresy, abruptly to quit the church, convulsed with inward laughter; though, to their credit, and to my shame, be it said, not a smile moved the muscles of the features of a single member of the Catholic auditory."

The outbreak is described with the accuracy of an eye-witness:—

"Throughout the summer and autumn of this eventful year, the public mind had been kept in an almost constant state of agitation and alarm, by the proceedings of the leaders of the French Canadian party in various parts of the country, and an apprehension of imminent but indefinable danger was beginning to be universally entertained. Impunity begetting confidence, meetings of the most treasonable character, which had been at first held secretly at midnight, were now held unconcealedly in open day. Public drills, in large bodies, next succeeded; and these were followed by weekly reviews, which generally took place on the morning of the Sabbath, after the hour of mass. Throughout Lower Canada the Sabbath is, indeed, the grand day, even in peaceful times, with the French Canadians for the transaction

of business of a public nature; and strange exhibitions take place at the church-door, where, as the congregations issue from the edifice, they are addressed by individuals charged with the duty of expounding to them the merits of sheriffs' sales, and public announcements of every kind. The agitators of the period availed themselves of this ancient usage to address their willing auditories on the palatable topics of virulent abuse of the British government and people; praise of the patriotism and disinterestedness of the immortal Papineau; plans for the advancement, in all earthly prosperity, of the incipient '*Grand Nation Canadienne*,' whereof the attentive listeners were represented as choice specimens; fierce denunciations against red-coats, accompanied with insinuations of their wearers finding, ere long, free quarters without rations in the St. Lawrence; the whole string of invectives being wound up with three cheers in favour of that very public, yet practically unknown, personage—*Dame Liberty*. Curiosity induced me frequently to visit the scenes as well of this peculiar oratory as of the drills, because at both strong points of national character were constantly elicited. Though the whole matter was becoming somewhat too serious to be made a source of amusement, I am bound to confess, that much of what I witnessed was of that ludicrous character to make me almost forget, at the moment, the danger which lurked beneath it. Some of the drill-scenes, in particular the marshalling and arraying of the recruits, and the manœuvres practised, were mighty rich; but it was not the less evident that the performers were becoming at each rehearsal more proficient in their new vocation, and might soon be converted into formidable opponents. All these proceedings, it was obvious, must end in something more than child's play; and a doubt naturally suggested itself to the minds of many, considering the great numerical disproportion between the two respective races, and the mere handful of troops then in the country, whether the approaching torrent could be stemmed. The British inhabitants, however, far from giving way to despondency, began to see that their main reliance must be upon themselves, if they would avoid the dreadful calamity which their being found unprepared would entail upon them and their families. For a long time, fruitless applications were made to Lord Gosford, or, as the French Canadians termed him, '*Milord Goose-fort*,' to sanction the formation of the loyal inhabitants into corps; nor was it until the eleventh hour that his lordship could be brought to understand the real nature of the danger, or to free entirely Sir John Colborne from the shackles in which his relative subordination placed him. When *carte blanche* was at length given to Sir John to act as circumstances might require, he immediately adopted the most vigorous measures; and the alacrity with which those measures were seconded by the gallant race of men interested in their promotion, proved how well they were aware of the difference between the ostensible and the real objects of the hostile party. As a measure of precaution, the different banks of Montreal sent down about this time their specie to

Quebec, for safe-keeping in the citadel. In the midst of all this incertitude and consternation, not the least expectation either of American interference in behalf of the insurgents, or of a simultaneous rising in Upper Canada, appeared to obtain. If any looked to these contingencies, they wisely preserved silence; for the promulgation of any fears of this kind—particularly on the latter point, as the people confidently looked for aid from the sister province—would, probably, have been attended, from the greater degree of depression it would not have failed to create, with the most fatal consequences. It would be, at best, a doubtful advantage to the French Canadians to emancipate themselves by forcible means from their present religious thralldom, without being first prepared for the rational enjoyment of such freedom by an enlightened course of education. An incidental occurrence, which took place on the 6th of November, brought prematurely to a crisis the disease I have been describing, and precipitated the designs of the French Canadian party, who had intended to defer their execution until the navigation of the St. Lawrence should be fairly closed. The day in question had been fixed upon by the rival parties each to assemble, and afterwards to walk in procession through the streets; of course with the object of a mutual exhibition of numerical strength. Justly apprehending that the peace of the city would be endangered by such a proceeding, the local magistracy issued a proclamation, warning the inhabitants generally to remain at home, and exacted privately from the leaders of either party a promise that they would exercise their influence to prevent the proposed assemblage. This promise, the British, on their part, faithfully adhered to, and their efforts were successful; but the French Canadians either violated theirs, or were ill-obeyed; since, in the course of the afternoon, a body of about two hundred of their partisans, mostly carrying sticks, converged, from various quarters of the town, towards a tavern, situated between St. Paul's and Saint James's Streets, which run parallel, and having in its rear a large stable-yard with gates opening on the latter thoroughfare, the best and widest in Montreal. In this yard they congregated, and, according to the reports of strangers who got amongst them, harangues, surpassing all former treasonable displays, were uttered, and a resort to violence, though not on that occasion, more strongly than ever recommended. Whilst this was going on, some members of the British party, incensed at the violation of the pledge given in the morning, planted themselves in front and rear of the meeting-place, and parading the Union-Jack, with jeers and shouts, defied the would-be Romans to issue forth. This, the latter abstained for a long time from doing, as the numbers of their besiegers (though not exceeding at the utmost fifty men and boys) had been so magnified that they were filled with a very terror; and, according to all accounts, so far were they from manifesting any thing like warlike ardour, that their only anxiety was to get safe home. The house in which I resided nearly faced the entrance to the stable-yard, so that I could witness in safety all that was passing; hence, being struck with the extreme folly of our people, who were by no means justified in interfering, and who, even otherwise, were too feeble to resist should they be assailed, I remarked to a friend who was standing at the window with me, that they would surely have cause to repent their temerity. I had scarcely uttered the words, when a loud shout was raised, and presently,

uttering hideous yells, out rushed the besieged, who had now learned how few were their challengers, into the open space before me, which they cleared in a twinkling, striking right and left with their sticks. By this time, my friend and I had gone down to secure the street-door; but before doing so, we half-opened it, whereupon admittance was implored by several of the fugitives, and of course granted to them, one of the individuals so sheltered just escaping a blow aimed at him with a heavy bludgeon by one of his pursuers. On resuming my station at the window, I found that the assailants had made a halt, and were conferring as to their further proceedings, sentries being placed at the corners of the cross streets, branching right and left, and hurling down them an incessant shower of stones. Never did I gaze on such an infuriated band of ruffians, and, making allowance for the difference of attire, their whole appearance and demeanour might not unaptly realise our conception of what must have been in reality the scenic-represented followers of Maaniello. Nevertheless, it was quite evident that, although elate with their petty triumph, they were very uneasy at the position in which they had placed themselves; and I am quite satisfied, from the blended expression of their countenances, betraying as they did both fierceness and anxiety, that they found it necessary to lash themselves into a state of furious excitement, in order to subdue their fears, and would have been right glad to escape without doing further battle. That they had anticipated the possibility of having at least to act upon the defensive was apparent in the first instance, from the majority of them being armed with sticks; and, had any doubt remained on this point, it would now have been removed, as weapons of a more deadly character began to display themselves; and I observed, in particular, one ferocious-looking fellow to draw from a side-pocket a most formidable two-edged knife, half twelve or fifteen inches long. Their chief leader was a very fine young man, named Desrivieres, a clerk in the Bank du Peuple, who deputed himself in a manner that would have graced a nobler cause, and whose example certainly went far to inspire his comrades with a temporary confidence. From their excited state, it required the utmost efforts, both of himself and others, to marshal them in any thing like order. After much wavering and indecision as to whether they should keep together or scatter, they at length decided on the former course; and, screwing their courage once more to the sticking place, raised another shout, and rushed tumultuously up the street towards the Place d'Armes, clearing all before them, and hurling destructive missiles at the windows of obnoxious individuals. On reaching the Place, they were encountered by a reinforcement of the British party, which, on the first defeat, had been summoned to the rescue, and a general *mêlée* ensued, during which much severe punishment was inflicted on both sides, though happily no lives were lost. Both parties claimed the victory on this occasion, and perhaps with equal justice: the French Canadians succeeding in getting home in small parties down the numerous cross streets, notwithstanding the attempt to intercept them; and the British remaining in possession of the scene of conflict, which it was evidently not the object of their opponents to retain."

Respecting the interference on the American side, there is much curious information; and an account of one of their associations will be perused with much interest:—

"Among the more prominent measures of the conspirators, were the formal appointment of officers to command their army; the nomination of a president and a vice-president for the proposed Canadian republic; and the promulgation of the prospectus of an embryo bank, the projected capital whereof, fixed at 7,500,000 dollars, or 1,687,500*l.* sterling, was to be exclusively employed in effecting the conquest of Canada, and reimbursed by the confiscation of Canadian lands, the holder of so much stock being entitled to its estimated equivalent in land. The general proceedings of the association were not conducted with so much secrecy, notwithstanding an affectation of masonic mystification, but that they occasionally transpired; and the following sketch, derived from authentic sources, will serve to shew the mode of initiating persons to the different degrees of membership of the lodges, into which, as in masonry, the association was divided, and also the nature of the so admitted Hunter's obligation. Persons about to be initiated as members were introduced into the lodge blindfolded; on which the following oath was administered to them:—'You swear, in the presence of Almighty God, that you will not reveal the secret sign of the snow-shoe to any, not even to the members of the society. You will not write, print, mark, engrave, scratch, chalk, or in any conceivable manner whatsoever, make the shape or sign of the snow-shoe to any living being, not even to the members of this society. You, furthermore, solemnly swear that you will not reveal any of the secrets of this society, which may come to your knowledge, through the president, vice-president, or his cabinet. You, furthermore, solemnly swear that you will give timely notice to any member or brother, if you know of any evil, plot, or design, that has been carried on against him or the society. You, furthermore, solemnly swear that you will render all assistance in your power, without injuring yourself or family, to any brother or member of this society, who shall at any time make the sign of distress to you. You, furthermore, solemnly swear that you will attend every meeting of your lodge, if you can do so without injury to yourself or family. This you swear, as you shall answer to God.' The first degree was called the 'snow-shoe' degree, and had four signs. The test made use of, upon which most reliance was placed, in case a stranger should become acquainted with any of the signs, was that of membership, or the snow-shoe. Should all other questions have been satisfactorily answered, the person under examination was asked if he had ever seen a snow-shoe, and required to make such sign upon paper. If he attempted to make any representation of it, he was immediately known not to be a member; since, as above stated, all were sworn not to make that sign. The first of the signs used in communication, was to lay the palm of the left hand over the back of the right, with the fingers of both hands extended and apart from each other, and then to let both hands fall carelessly in front of the body. The second sign in snow-shoe degree was used in shaking hands, when the parties took the cuff of each other's coat between the finger and thumb. The third sign consisted in the inquiry—'Are you a Hunter?' The answer was the name of the day succeeding the day of the week on which the question might be asked. The fourth sign was lifting the right hand to the ear, with the palm in front, and pressing the ear slightly forward. The signs were answered by the same sign, or by any of the signs. The

second degree was called the 'Beaver' degree; the oath pertaining thereto being:—"You swear, in the presence of Almighty God, that you will not reveal the sign of the beaver degree to any one who is not a member of the same degree with yourself." The sign of this degree was as follows:—"Do you know the beaver to be an industrious animal?" No answer was made verbally, but the left hand was lifted to the mouth—the palm nearest the face; the fingers were bent, the fore-finger being placed under the chin, and the nail of the thumb between the front teeth, which were closed upon it, to imitate the action of a beaver gnawing a tree. The third degree was called the 'Master Hunter's' degree: the oath belonging to it was similar to that last-mentioned. The sign was the interrogation—"Trouble?" and the answer thereto, 'Calme;' the right hand being at the same time moved from the right to the left side of the body, the back of the hand upwards, and the fingers and hand horizontal. The fourth degree was called the 'Patriot Hunter' degree: the oath was similar to that preceding. There were three signs belonging to it; the first of which was comprised in the question—"Do you snuff and chew?" The answer was—"I do." At the same time, if the party questioned had a snuff-box about him, he took it out, and made upon it three scratches with his nail; but if he had no such article, he put the thumb of his left hand into the left pocket of his waistcoat, and made three scratches with the finger-nail upon the waistcoat. The second sign was—"Have you any news for me?" Answer—"Some." The third sign of this degree was the sign of distress. The left hand was raised, with the palm forward; the fingers extended, but not apart; the thumb pointing to the coat-collar. There was a method of gaining admission to the lodge, exclusive of all these signs. You went to the door and gave two raps on the outside, which were answered by two on the inside. You then gave one rap on the outside, which was answered by one on the inside. You then made three scratches on the outside, and were thereupon admitted. The first, or 'snow-shoe' degree, was intended to be universal in the 'army' of the self-styled 'patriots'; the privates took this degree; the commissioned officers, two degrees; the field-officers, three degrees; the commanders-in-chief, four or more degrees. The members of the society, whether enlisted or not, always took four degrees; but they were only to use the first degree in the army if they enlisted. The object of the society was stated after the party initiated had taken the fourth degree, as also some of the plans and operations; but the whole was not communicated except to the grand masters, commanders-in-chief, and others, in whom implicit confidence was reposed. The general object of the society, or association, was stated to be 'the emancipation of the British colonies from British thralldom.' The hunters' signs, as above described, having been more or less divulged during the winter of 1838, underwent some changes in the course of the year following, when a fresh invasion of Canada was in agitation. The sign of recognition in the States was now stated to be the moving of the index-finger of the right hand with a circular motion, acknowledged by waving the left hand. In Canada, the same object was effected by one party putting either of his hands into his pocket, taking therefrom some change, and saying, 'Times are easier;' the answer being, 'Truly.' In 1839, when a person was initiated into a lodge, he beheld, after the removal of the bandage from his eyes, a man, having be-

fore him, on a table, either a dagger or a pistol, and was told that such weapon was intended to remind him of the manner of his death, should he reveal any secret to the injury of the cause he had espoused, or of a brother. In 1838, the same weapons were also laid upon the table, on similar occasions; but nothing was then said respecting them, unless the party was initiated as a 'Patriot Mason,' or 'Beaver Hunter.' It was, indeed, said, that several persons had been secretly disposed of for divulging the secrets of the association, or giving information respecting its proceedings. The judicious military arrangements made by the high military authorities, must alone be considered, humanly speaking, as having saved Canada at this crisis of its fate."

On the Maine boundary question, and the suspected intriguing of Russia, Mr. Preston supplies some novel remarks; but we must defer any further notice till our next, if we then can find room.

*The Letters of Horace Walpole. Vol. III.* 8vo. London, 1840. Bentley.

As this edition proceeds letters hitherto unpublished begin to appear in greater numbers, and add new attractions to the sprightly and witty correspondence, so entertaining and so popular without them. There are nineteen in the present volume, which includes the years 1753-9, chiefly addressed to John Chute, Esq., the Hon. H. S. Conway, and Sir David Dalrymple, the latter embracing some of the literary topics of the day. They are all pleasant and pointed; but the following extracts will enable our readers to judge of these qualities for themselves. In a letter to Conway (whom the writer flatters consumedly in all his epistles), he says:—

"Now [1756] I am in a serious strain, I will finish my letter with the only other serious history I know. My Lady Lincoln has given a prodigious assembly to shew the Exchequer House.\* She sent to the porter to send cards to all she visited: he replied, he could easily do that, for his lady visited nobody but Lady Jane Scott. As she has really neglected every body, many refusals were returned. The Duchess of Bedford was not invited, and made a little opposition-supper, which was foolish enough. As the latter had refused to return my Lady Falmouth's visit, my Lady Lincoln singled her out, visited and invited her. The dignity of the assembly was great: Westminster Hall was illuminated for chairs; the passage from it hung with green baize and lamps, and matted. The cloister was the prettiest sight in the world, lighted with lamps and Volterra vases. The great apartment is magnificent. Sir Thomas Robinson, the Long, who, you know, is always propriety itself, told me how much the house was improved since it was my brother's. The Duchess of Norfolk gives a great ball next week to the Duke of Cumberland: so you see that she does not expect the Pretender, at least this fortnight. Last night, at my Lady Hervey's, Mrs. Dives was expressing great panic about the French: my Lady Rochford, looking down on her fan, said with great softness, 'I don't know, I don't think the French are a sort of people that women need be afraid of.' Adieu!"

This little sketch of the fashionable world of our grandmothers gives a very different view from that of the reformed Exchequer chambers in our time; where it would be a thing indeed to see an "At Home," and Westminster Hall lighted up as a lobby. Here is another touch of the same lively sort in June:—

\* "Lord Lincoln was at this time auditor of the exchequer.—E."

"I have passed to-day one of the most agreeable days of my life: your righteous spirit will be offended with me—but I must tell you: my Lord and Lady Bath carried my Lady Hervey and me to dine with my Lady Allen at Blackheath. What added to the oddness of the company in which I found myself was her sister, Mrs. Cleveland, whose bitterness against my father and uncle for turning out her husband you have heard—but she is very agreeable. I had a little private satisfaction in very naturally telling my Lord Bath how happy I have made his old printer, Franklyn. The earl was in extreme good humour, repeated epigrams, ballads, anecdotes, stories, which, as Madame Sévigné says, put one in mind 'de sa défunte voisine.' The countess was not in extreme good humour, but in the best-humoured ill humour in the world; contested every thing with great drollery, and combated Mrs. Cleveland on Madame Maintenon's character with as much satire and knowledge of the world as ever I heard in my life. I told my Lord Bath General Wall's foolish, vain motto, 'Aut Caesar aut nihil.' He replied, 'He is an impudent fellow: he should have taken 'Murus aheneus.' Dodington has translated well the motto on the caps of the Hanoverians, 'Vestigia nulla retrorsum.' They never mean to go back again."

A repartee in a letter of the ensuing year deserves separate preservation:—

"My Lord Chesterfield is relaxed: he sent Lord Bath word lately that he was grown very lean and very deaf: the other replied, that he could lend him some fat, and should be very glad at any time to lend him an ear."

Again, February 1759:—

"Colonel Campbell marries the Duchess of Hamilton forthwith. The house of Argyle is content, and think that the head of the Hamiltons had purified the blood of Gunning; but I should be afraid that his grace was more likely to corrupt blood than to mend it. Never was any thing so crowded as the house last night for the Prussian cantata; the king was hoarse, and could not go to sing his own praises. The dancers seemed transplanted from Sadler's Wells; there were milkmaids riding on dolphins; Britain and Prussia kicked the king of France off the stage, and there was a *petit-maitre* with his handkerchief full of holes; but this vulgarity happily was hissed. I am deeper than ever in Gothic antiquities: I have bought a monk of Glastonbury's chair, full of scraps of the Psalms; and some seals of most reverend illegibility. I pass all my morning in the thirteenth century, and my evenings with the century that is coming on. Adieu!"

Our next quotations are of so literary a character that we copy them entirely. The first letter is dated Strawberry Hill, June 29, 1758; and addressed to Sir D. Dalrymple, which "eminent lawyer, antiquary, and historian, was born in 1726. He was educated at Eton, and afterwards studied civil law at Utrecht. In 1748 he was called to the Scotch bar, and in 1766 made a judge of session, when he assumed the name of Lord Hailes. Boswell states, that Dr. Johnson, in 1763, drank a bumper to him 'as a man of worth, a scholar, and a wit.' His 'Annals of Scotland,' the Doctor describes as 'a work which has such a stability of dates, such a certainty of facts, and such a punctuality of citation, that it must always sell.' He wrote several papers in the 'World' and 'Mirror.' He died in 1792.—E." His memoirs are indeed one of the most trustworthy and best historical works in our language; but we go to Walpole's letter:—

"Sir,—Inaccurate and careless, as I must

own my book is,\* I cannot quite repent having let it appear in that state, since it has procured me so agreeable and obliging a notice from a gentleman whose approbation makes me very vain. The trouble you have been so good as to give yourself, sir, is by no means lost upon me; I feel the greatest gratitude for it, and shall profit not only of your remarks, but, with your permission, of your very words, wherever they will fall in with my text. The former are so judicious and sensible, and the latter so well chosen, that if it were not too impertinent to propose myself as an example, I should wish, sir, that you would do that justice to the writers of your own country, which my ignorance has made me execute so imperfectly and barrenly. Give me leave to say a few words to one or two of your notes. I should be glad to mention more instances of Queen Elizabeth's fondness for praise,† but fear I have already been too diffuse on that head. Buford‡ is certainly Lord Halifax: the person at whom you hint is more nearly described by the name Bubo, and I think in one place is even called Bubb.§ The number of volumes of Parthenissa I took from the list of Lord Orrery's|| writings in the 'Biographia': it is probable therefore, sir, that there were different editions of that romance. You will excuse my repeating once more, sir, my thanks for your partiality to a work so little worthy of your favour. I even flatter myself that whenever you take a journey this way, you will permit me to have the honour of being acquainted with a gentleman to whom I have so particular an obligation."

The next is of February 7, 1759, and runs thus:—

"I think, sir, I have perceived enough of the amiable benignity of your mind, to be sure that you will like to hear the praises of your friend. Indeed, there is but one opinion about Mr. Robertson's History.¶ I don't remember any other work that ever met universal approbation. Since the Romans and the Greeks, who have now an exclusive charter for being the best writers in every kind, he is the historian that pleases me best; and though what he has been so indulgent as to say of me ought to shut my mouth, I own I have been unmeasured in my commendations. I have forfeited my own modesty rather than not do justice to him. I did send him my opinion some time ago, and hope he received it. I can add, with the strictest truth, that he is regarded here as one of the greatest men that this island has produced. I say island, but you know, sir, that I am disposed to say Scotland. I have discovered another very agreeable writer among your countrymen, and in a profession where I did not look for an author; it is Mr. Ramsay,\*\* the painter, whose pieces being anonymous, have been overlooked. He has a great deal of genuine wit, and a very just manner of reasoning.

In his own walk, he has great merit. He and Mr. Reynolds are our favourite painters, and two of the very best we ever had. Indeed, the number of good has been very small, considering the numbers there are. A very few years ago there were computed two thousand portrait-painters in London: I do not exaggerate the computation, but diminish it; though I think it must have been exaggerated. Mr. Reynolds and Mr. Ramsay can scarce be rivals, their manners are so different. The former is bold, and has a kind of tempestuous colouring, yet with dignity and grace; the latter is all delicacy. Mr. Reynolds seldom succeeds in women; Mr. Ramsay is formed to paint them. I fear I neglected, sir, to thank you for your present of the history of the conspiracy of the Gowries; but I shall never forget all the obligations I have to you. I don't doubt but in Scotland you approve what is liked here almost as much as Mr. Robertson's History; I mean the marriage of Colonel Campbell and the Duchess of Hamilton. If her fortune is singular, so is her merit. Such uncommon noise as her beauty made has not at all impaired the modesty of her behaviour. Adieu!"

We conclude with a passage from a third letter of July, the same year:—

"Can I think that we want writers of history while Mr. Hume and Mr. Robertson are living? It is a truth, and not a compliment, that I never heard objections made to Mr. Hume's history without endeavouring to convince the persons who found fault with it of its great merit and beauty; and for what I saw of Mr. Robertson's work, it is one of the purest styles, and of the greatest impartiality, that I ever read. It is impossible for me to recommend a subject to him; because I cannot judge of what materials he can obtain. His present performance will undoubtedly make him so well known and esteemed, that he will have credit to obtain many new lights for a future history; but surely those relating to his own country will always lie most open to him. This is much my way of thinking with regard to myself. Though the Life of Christina is a pleasing and a most uncommon subject, yet, totally unacquainted as I am with Sweden and its language, how could I flatter myself with saying any thing new of her? And when original letters and authentic papers shall hereafter appear, may not they contradict half one should relate on the authority of what is already published? for though memoirs written nearest to the time are likely to be the truest, those published nearest to it are generally the falsest."

#### BENNETT'S VOYAGE ROUND THE GLOBE.

[Fourth notice.]

WE must now look homewards; and changing the theme, touch at a memorable site—the tomb of Napoleon, now about to be visited for the purpose of removing his remains to France.

"The house in which the chosen Emperor of the French lived and breathed his last is now in the possession of a St. Helena farmer, who treats the building with respect, in an inverse proportion to the extent of his agricultural improvements. When I visited this venerated edifice in the early part of the year 1833, it bore the appearance of a respectable cottage. A small plot of garden-ground, enclosed by a

what embarrassed circumstances, he paid his debts. He was an excellent classical scholar, understood French and Italian, and had all the polish and liberal feeling of a highly instructed man. In Bouquet's pamphlet on 'The Present State of the Fine Arts in England,' published in 1755, he is described as 'an able painter, who, acknowledging no other guide than nature, brought a rational taste of resemblance with him from Italy.' He died in 1784.—E."

wooden fence, and a few steps, conducting to a portico covered by a light veranda, occupied the front of the dwelling; while the interior consisted of a billiard-room, and drawing-room, consecutively disposed, and a third, and more interior apartment, communicating on either side with a small closet, one of which had served as Napoleon's study, the other as his bed-room. The *sacra auri fames* had then spared the first apartment, or billiard-room, which, furnished with a table and chairs, was employed as a refreshment-room for visitors; the drawing-room, in which Napoleon expired, was more dilapidated, and contained a threshing and winnowing machine, profusely pencilled and chalked with names of persons. Now, alas! the floors of all the rooms were broken, decayed, and scarce safe to tread; the drawing-room was filled with manure; and the rest of the building devoted to stabling, or something worse;—the whole presenting a scene of filth and ruin that would scarcely bear investigation. Many rustic impediments, also, cast in the way of easy access to the building, sufficiently evinced that visitors to the spot were rather tolerated than desired. But few relics of the garden behind the house now remained, beyond a portion of the quick-turf enclosure, a tank or fish-pond, and a solitary peach-tree; which last was at this time covered with its delicate blossoms, as if in mockery of the surrounding desolation. The 'new house' erected for Napoleon, but which he did not live to occupy, is a large and handsome building, placed but a short distance from the old residence, and so sunk in a vale, as to leave little more than its roof visible from the approaches. It was, until recently, the governor's country residence; but is now occupied by a chaplain, and partly employed as a church."

The Appendix, to which we have already referred, presents a good natural history of the whale, divided into three tribes or families; a Scoresby-like account of whaling and its perils; and a well-arranged list of birds, fish, mollusca, and botany, which attracted the author's attention, and some of them quite new to us: of these we select a few specimens, as being of interest to naturalists:—

*Birds.*—"Unable to seek their prey in the water, the sea-hawks limit their depredations to fishes that leap, or flying-fish, when, disturbed by the passage of a ship, or pursued by albacore and bonita, they rise in the air to seek that security which the water denies them. The larger predaceous fish are in this manner of essential service to the frigate-bird; the latter usually taking the prey which the former have startled but failed to secure. When the ocean is turbulent these birds fare sumptuously every day. We have seen one individual take three flying-fish in the course of a few minutes; and more than that number was rejected from the stomach of another example, which we captured. When the sea is calm their fishing is less successful, and it is then that they resort to that peculiar system of plunder for which the species is so remarkable, namely, attacking other sea-fowl, as boobies or tropic-birds (whose power of diving enables them to obtain food at all times), and compelling, them by repeated blows, to disgorge the fish they have swallowed, and which, when ejected, the frigate-bird seizes with great dexterity before it falls into the sea. In the course of their own fishing, also, should the fish they have seized be placed awkwardly in their beak, they do not scruple to drop it, trusting to their power of again pouncing upon it and grasping it in a more favourable position, before it reaches the water."

**Fish.**—"Order, Chondropterygii.—The Luminous Shark. (*Squalus Fulgens*, N. Sp.) There are so few well-authenticated instances of a phosphorescent power existing in fish, as an attribute of life, that it is with some surprise we find this peculiarity inherent in the shark, a family so generally well known and described. The *Squalus* which I have to notice, is, however, a nondescript species, and one that certainly possesses a luminous power in a very high degree. Two examples of this fish were accidentally taken, at different periods of the voyage, by a net, towing on the surface of the sea. The first was obtained in lat.  $2\frac{1}{2}^{\circ}$  S., long.  $163^{\circ}$  W. and was ten inches in length. It was captured in the day-time, and, consequently, although its novel appearance attracted my attention, its phosphorescent power was not then noticed. The second specimen was taken at night, in lat.  $55^{\circ}$  N., long.  $110^{\circ}$  W. Its entire length was  $1\frac{1}{2}$  foot. Both fishes were alive when taken on board. They fought fiercely with their jaws, and had torn the net in several places. The form and structure of this shark is peculiar, and would denote that it is a species of the sub-genus *Scymnus*: the body is cylindrical, rather slender, and tapers finely at the tail. Its prevailing colour is dusky-brown; a broad black band, or collar, passes across the throat; and the fins are partially margined with white. The skin is rough, as is usual with the shark tribe. The number of gill-apertures is five on each side. The fins are short, and, for the most part, disposed to a round form: the dorsal are two in number, small, and placed far back; the tail-fin is unequally divided, the upper being the longest and largest lobe. The head is flat. The snout prominent, rather pointed, and has two nostrils at its extremity. There is, also, on each side of the upper and back part of the head, a large oval orifice, like a spiracle or nostril, provided with a valve, and communicating with a corresponding aperture in the roof of the mouth. The mouth is capacious, and the dark skin around it is incised on each side, to some extent beyond the commissure of the lips, exposing a white elastic membrane beneath. The upper jaw is armed with many rows of small sharp teeth, while the lower has only a single row of perpendicular teeth, or rather an elevated plate of bone, sharply toothed on its summit, and bearing a close resemblance to a segment of the surgical circular saw called a *trephine*. The eyes are much more prominent and dilated than is usual with sharks; the iris is black; the pupil transparent, and of a greenish colour. The example I dissected was a female. The abdomen contained six round membranous eggs, each the size of a pigeon's egg, and containing a colourless glairy fluid. The two uteri were empty and collapsed. The principal peculiarity in the anatomy of this shark is the existence of what must be regarded as a sternum, or breast-bone (which is by no means common, even in bony fishes). It is a small bone, shaped like a horse's hoof, and has two processes projecting laterally, by which it is articulated to the bones supporting the pectoral fins. The hollow of the hoof (to pursue the comparison) is closed inferiorly by membrane, and the heart, invested in pericardium, is lodged within it, as in a box or cell. When the larger specimen, taken at night, was removed into a dark apartment, it afforded a very extraordinary spectacle. The entire inferior surface of the body and head emitted a vivid and greenish phosphorescent gleam, imparting to the creature, by its own light, a truly ghastly and terrific

appearance. The luminous effect was constant, and not perceptibly increased by agitation or friction. I thought, at one time, that it shone brighter when the fish struggled, but I was not satisfied that such was the fact. When the shark expired (which was not until it had been out of the water more than three hours), the luminous appearance faded entirely from the abdomen, and more gradually from other parts; lingering the longest around the jaws and on the fins. The only part of the under surface of the animal which was free from luminosity was the black collar around the throat; and while the inferior surface of the pectoral, anal, and caudal fins shone with splendour, their superior surface (including the upper lobe of the tail-fin) was in darkness, as also were the dorsal fins, back, and summit of the head. I am inclined to believe that the luminous power of this shark resides in a peculiar secretion from the skin. It was my first impression, that the fish had accidentally contracted some phosphorescent matter from the sea, or from the net in which it was captured; but the most rigid investigation did not confirm this suspicion; while the uniformity with which the luminous gleam occupied certain portions of the body and fins, its permanence during life, and decline and cessation upon the approach and occurrence of death, did not leave a doubt in my mind but that it was a vital principle, essential to the economy of the animal. The small size of the fins would appear to denote that this fish is not active in swimming: and since it is highly predaceous, and evidently of nocturnal habits, we may perhaps indulge in the hypothesis, that the phosphorescent power it possesses is of use to attract its prey, upon the same principle as the Polynesian Islanders, and others, employ torches in the night fishing. \* \* \* **The Luminous Scopelus.**—(*Scopelus Stellatus*, N. Sp.) This is the luminous fish noticed in the *Narrative*,

upper, and both are provided with teeth. There is no evident tongue, but in its place a bundle of black rigid fibres, sent off from the bones that support the gills. Eyes, large; iris, silvery; branchiostegous rays, eight; pectoral fins comparatively long, slender, and curved; dorsal placed near the centre of the back. All these fins have numerous slender branched rays, and are spotted with gray. On the back, near the tail, there is a small transparent and elastic appendage, which may, perhaps, be considered an adipose fin. The scales covering the body are large, very compactly placed, and of a metallic-white hue. Those on the lateral line are larger and more prominent than the others, and are arranged in the peculiar manner represented in the above sketch. A row of small circular depressions, resembling the marks on dice, each silvered within and surrounded by a narrow black zone, occupies the margin of the abdomen and side of the tail; and similar depressions are also more irregularly scattered over other parts of the under surface of the body. The head is covered with large scales, or plates. These last, as well as the scales covering the body, and more especially the depressions on the abdomen and tail (and which appeared like stars) shone with a brilliant phosphorescent light while the fish was alive, but lost this power immediately after death. The examples we captured had their stomach distended with pelagic shrimps.

\* \* \* **Order, Apodes.**—The Glass-Eel, or Small-Head. (*Leptocephalus*, Sp.)—This is one of the most extraordinary and paradoxical fishes the ocean affords. In its external appearance, indeed, there is nothing but the perfect form and structure of its head that gives it any title to rank with so high a grade of the animal kingdom as it really occupies. The head is narrow and disproportionately small; the jaws, long, pointed, and provided with sharp teeth; eyes, large and conspicuously bright; iris, silvery; pupil, black; the body is long and very compressed; it widens abruptly immediately behind the head, and remains nearly the same size until it approaches the tail, when it tapers to a fine point. It is smooth, consists of a firm gelatinous structure, enveloped in a tough tunic, is colourless, and in all parts so perfectly transparent, that when laid on the page of a book it does not obscure the smallest letter. No traces of viscera interrupt its uniform transparency. A white thread-like line passes within the entire length of the body, near its upper third, and is intersected by similar slender lines, arranged obliquely and at equal distances. They resemble the rudiments of a skeleton; but are, more probably, portions of a nervous system. There are no pectoral, ventral, nor caudal fins; the dorsal is merely a thin narrow membrane, occupying the entire length of the back; and the anal, which reaches nearly to the tail, is equally insignificant. Examples of this fish, when first taken from the water, did not exhibit the slightest movement, or other sign of life, and their body retained the curve which I have given to it in the above sketch; but when they were put into a vessel of sea-water, immediately they were taken from the net, they swam actively, with a twirling or eel-like motion. All the specimens we obtained were taken near the surface of the sea. They varied much in size. The average length of the species appeared to be from seven to ten inches; though one individual we captured measured one foot three inches in length, and an inch and a half across the broadest part of the body; its head was, as usual, small, and bore no proportion to

The Luminous Scopelus.

The Glass-Eel, or Small-head.

as having occurred to us so abundantly in lat.  $43^{\circ}$  S., Pacific Ocean. The average length of the species is about three inches; the body compressed; head large and blunt; mouth capacious; the lower jaw protrudes beyond the

the increased size of the body. In the Pacific Ocean and Indian Archipelago, the species occurred to us from lat. 3° to 29° N., and from the Equator to 9° S.; and nowhere in such great abundance as in the Straits of Timor. In the Atlantic we captured one individual, in lat. 24° N. The only species of *Leptocephalus* hitherto known is *L. Morrisii*, found on the coast of Anglessea. The description and figure given of it leads me to think that it accords very closely with the exotic species we obtained. Size, geographical distribution, and some few other peculiarities noticeable in the tropical specimens, as above described, may induce us to suspect a difference, although it is difficult to detect sufficient specific distinctions in animals of so anomalous a structure. It is impossible to preserve specimens of this fish in any kind of spirit; for, when thus prepared, they invariably become opaque, swell to an unnatural size, and ultimately burst and fall into a flaccid state. I succeeded in bringing several examples to England, in a very complete state of preservation, by putting them into a saturated solution of sea-salt, alum, and nitre—a solution which answers well, also, for the preservation of pellucid and delicate molluscs.”

The Molluscs in our next.

#### MEMOIRS OF ROMILLY.

[Fourth notice: conclusion.]

As might be expected, much of Sir Samuel's Parliamentary Diary is occupied with the subject of legal reforms and the slave-trade, in which he took so strenuous an interest; and these portions will be found to contain many humane and excellent reflections. During the autumnal vacations from Courts and Commons, he wisely sought relaxation and health in country excursions, and administering his light and pleasant duties at Durham. On these occasions he burdened his mind with as little business as possible; and in 1807 we have the following “noticeable” observations respecting them:—

“I left town for the long vacation, intending to pass it at Cowes in the Isle of Wight with my family. I have some cases which I have been unable for some time past, during my close attendance in court, to answer; and these I very reluctantly take with me into the country; but I am determined not to let any fresh cases be sent after me. If I were to suffer this, I should have full occupation, and occupation of a kind extremely disagreeable to me, during the whole vacation. The truth is, that for the last two or three years I have declined, as much as I well could, the giving of opinions. It is so important that one's opinion should be right (for in many cases it has the effect of a decision to the parties, and in others it involves them in expensive litigations); and at the same time it is so difficult, in the state of uncertainty which the law is in, to satisfy one's mind upon many questions put to one; and, in many cases, it must depend so much upon the particular mode of thinking of the judge, before whom the question may happen to be brought, what the decision will be, that I have long found this to be the most irksome part of my profession.”

And this is the glorious uncertainty in which consists the perfection of human wisdom! On the subject of buying parliamentary seats, the following year furnishes a pregnant illustration. It is not inappositely dated 1st April, and runs thus:—

“Piggott took occasion to speak to Calcraft on the subject of Wareham, and this morning informed me that I might have the seat for

2000*l.*, the sum which I was to have paid for Horsham: but that, though I was to pay no more, Calcraft would receive 3000*l.*; the remaining 1000*l.* being paid out of a fund which till now I did not know existed, and which has been formed, as I understand, by the most distinguished persons in Opposition, to answer extraordinary occasions. I was staggered at the first mention of this, and stated my objections to Piggott. He told me that he did not see how I could consider it as in any respect objectionable; that the principal persons of opposition were very anxious that I should be in parliament, and only regretted that I should be at any expense at all. I cannot, however, persuade myself to accept a seat upon these terms; and accordingly, in the evening, I wrote Piggott a note in these words:—‘It is impossible to be more sensible than I am of the very kind and friendly part which you have taken for me. But, after reflecting on what was the subject of our conversation this morning, I feel a very great reluctance to consent to let the matter be arranged in the way that has been proposed. I am afraid that, after the matter is settled, I shall feel uncomfortable about it; and I had rather at once determine to be at all the expense myself. Do not ascribe this to any pretensions to an extraordinary degree of delicacy; I really have no such pretensions: but where one is in doubt, it is best to be on the safe side; and as it is only a pecuniary sacrifice that is to be made, it is a great satisfaction to be quite sure that one will not hereafter have cause to repent of what one has done. I must again and again thank you for your kindness to me, upon this and upon former occasions.’ The matter has been settled with Mr. Calcraft accordingly, and I pay the whole 3000*l.* myself.”

In 1810, on the king's illness, there is a historical statement which we do not remember to have met, so precisely at least, before. December 17th:—

“The committee made their report of the examination of the physicians, and it was ordered to be printed. The whole of the evidence, however, which the physicians gave, does not appear in the report. Several of the questions and answers were expunged by the committee before they made their report. Some of the most important facts so suppressed are, that the cause of the king's insanity in 1801 was the resignation of Mr. Pitt; and the cause of his insanity in 1804, the publication of the correspondence between the Prince of Wales and the Duke of York.”

Of the Prince Regent's grand festival, in June 1811, it is mentioned:—

“A reason given for this festival was, that it might give employment to the manufacturers; and it was desired that the dresses of all the guests should be of British manufacture. It does not seem likely, however, to gain the regent much popularity. The great expense of this entertainment has been contrasted with the misery of the starving weavers of Lancashire and Glasgow. Among the higher orders, great offence has been given by the omission of invitations, either through neglect or design. The French prince who calls himself Louis XVIII., and the other princes of the house of Bourbon, were among the company, and were received with great distinction. The policy of this is not easy to be discovered.”

From a letter to Dumont, May 26, 1814, we select the annexed passages, as bearing on matters of interest; and with these few miscellanies conclude our limited review of a publication which has greatly delighted us.

“Our prince is not quite in such high spirits as he was in a little while ago. The arrival of the illustrious visitors he expected is put off for the present, and some difficulties have arisen about the Princess Charlotte's marriage, which have made it necessary at least to postpone it. The intended bridegroom, in the meantime, is living in lodgings at a tailor's in great obscurity, and with no appearance of opulence. The Duchess of Oldenburg has fallen into great disfavour. She is supposed to have given bad advice to the Princess Charlotte; and she was guilty of the indiscretion of paying a visit to Whitbread at his brewery. The prince has since said to her, that he supposes when she goes to Paris she will make a point of seeing Sauterre. The great object of his royal highness at present is to prevent the princess going to the queen's drawing-room, and being present at any of the festivals which the different clubs are about to give upon the restoration of peace. It is hardly credible what pains he has given himself to accomplish this noble purpose. \* \* \* Bentham is, I am afraid, about to engage in a speculation respecting the mills at Lanark, in Scotland, which is to have the double object of making the fortunes of those who engage in it, and of extending education and instruction among the lower orders of the people. I endeavoured strongly to dissuade him from it, thinking that, at his time of life, and in his situation, it was great folly to embark in any concern which, by possibility, no matter how remote, might involve him in difficulty and in distress, and ultimately in ruin. All my good advice, however, only made him very angry; as if he did not know how to manage his own affairs, as if he wanted advice, or was to be treated like a child! &c. &c. I told him that the man who was engaging him in this, though very well-intentioned, was really a little mad. To which his answer was, ‘I know that as well as you; but what does that signify? He is not mad *simpliciter*, but only *secundum quid*.’ Finding nothing was to be done, I took my leave of him, contrived to make him laugh, and put him at last in good humour by telling him that, though he would not take my advice, he might depend upon it that, when he was an uncertificated bankrupt, I would not turn my back upon him.”

Mr. Owen has become more renowned since those days. In the same correspondence in August we read:—

“London has for a long time been half crazy with emperors, and kings, and shows, and illuminations, and fireworks. It has at last sunk into a dead torpor, which is very stupid to the few fashionable persons who may be still lingering in town, but which is very salutary to the lower and laborious orders of the people. The mischief which has been done to the morals and happiness of the inferior artisans by the long holidays which they have been indulged with, is hardly to be conceived. I have been assured that several pawnbrokers have declared that, while these festivals lasted, they lent, on the pledges of the clothes, and furniture, and tools of their poor customers, about ten times as much as they are accustomed to do in ordinary times. This languid season, however, has been chosen by several poets for sending their choicest works into the world. We have a new poem by Rogers, another by Lord Byron, and a ponderous quarto, in blank verse, from Wordsworth, the laborious inspiration of many years. Bulky as it is, however, it is only the fragment of a larger poem. The title explains what it is,—‘The Excursion, being a portion of a Poem entitled ‘The Re-

cluse.' The scenes are in the humblest walks of life; the hero is a Scotch itinerant pedlar. Many of the verses are as prosaic as even Wordsworth ever wrote, and there is no story, and consequently nothing to give the reader any interest in the poem. There are, however, many beautiful lines, and it will certainly be praised with enthusiasm by the worshippers of the Lake-poets."

## MISCELLANEOUS.

*The Last Days of a Condemned. From the French of M. Victor Hugo; with Observations on Capital Punishments.* By Sir P. Hesketh Fleetwood, Bart. M.P. Pp. 192. London, 1840. Smith, Elder, and Co.

FRENCH imagination and English reason are brought in this volume into battery against the infliction of capital punishment. Victor Hugo's rapid and vivid glimpses at the cell and supposed feelings of a condemned criminal are prefaced by the strong and judicious remarks of Sir Hesketh Fleetwood, who dwells on the value of human life,—that lamp which once extinguished nothing can re-illuminate; and contends that no legislation has a right to shed the blood of man. The question is one of vast importance and difficulty; and we shall only say of this effort on the lenient side, that, besides its humanity, its talent and ability render it a piece of very interesting literature.

*La Bruja: The Witch; or a Picture of the Court of Rome, &c.* Translated from the Spanish by Markophrates. Pp. 188. London, 1840. Hatchard and Son.

THIS is a curious book, written in a striking manner, and passing in review the spiritual and temporal instances of cruelty and ambition, attributed by history to the possessors of the papal chair. Though but a brief chronicle, it signalises the leading and remarkable features of this usurpation, and causes their holinesses to run the gauntlet in a style which the author could only have enabled himself to execute by the application of an acute mind to a large circle of reading and research.

*Mrs. Loudon's Ladies' Flower Garden.* No. II. London, 1840. Smith.

THE bulbous plants in this Number lose nothing in comparison with the beauties of No. I. Various *Homeria*, curious *Ferraria*, and graceful *Laperousia*, adorn the groups; and one *Anomatheca cruenta* gives a finish to the last, which is worth a levee nosegay.

*The Luctubrations and Adventures of the Quæer Bachelor's Junto*, by Tacitus Stayde. No. I. (London, Cunningham.)—A political satire about England and America, we suppose, but we have not yet been able to make out its drift.

*A History of Slavery and its Abolition*, by Esther Copley. Second Edition. Pp. 648. (London, Houlston and Stoneman.)—Would we could read the history of the abolition of slavery! but that has yet to come, and we fear generations must pass away before the stain upon humanity is wiped out of the catalogue of crimes. The present little volume contains a feeling narrative of what has been attempted and done.

*The Early English Church*, by E. Churton, Rector of Crayke, Durham. Pp. 391. (London, Burns.)—We would recommend this volume as a very impartial and interesting history of the early English church, upon which, besides consulting the best authorities, the author has bestowed some research in quarters hitherto less consulted than they ought to have been. His maps of English counties, &c. in Saxon times, add much to the pleasure we feel in reading his statements; and a vein of liberal piety pervades the whole composition.

*A Hand-book for the Churches, &c.*, by a Labourer for Peace. Pp. 191. (Edinburgh, Printing and Publishing Company; Glasgow, Smith and Son; Ogle: London, Smith, Elder, and Co.)—A conciliatory attempt to bring all sects into bonds of friendly forbearance, with only the Bible (with all its different interpretations) for their guide.

*Ford's Guide to the Lakes.* Pp. 190. (Carlisle, Thurnham; London, Tilt.)—At this season, when the weather invites to these delightful retreats, we are glad to receive a second edition of this useful volume, which is all the stranger need desire.

*The English Mother*, by a Lady. Pp. 84. (Bath, Pocock; London, Simpkin and Co.)—Lessons, agreeably to the doctrine and discipline of the Church of England, rendered applicable to children with sense and discretion.

*The Psalter: Pointed as the Psalms are to be Sung or Said in Churches.* (London, Burns.)—A pretty little edition, and grammatically and expressively useful.

*The Merits of the Whigs, &c.*, by a Member of the House of Commons. (London, Fraser.)—A hot pamphlet against the miracle of Ireland and the present ministry.

*Early Days of the Society of Friends*, by Mary Ann Kelly. Pp. 471. —Views of the persons and acts of the early members of the Society of Friends, exemplifying their merits, and the good fruits of obedience of faith.

## ORIGINAL CORRESPONDENCE.

## CARTES CATALANES.

To the Editor of the Literary Gazette.

SIR,—In your No. 1214, I observe a letter addressed to the Geographical Society, from a Mr. Holmes "of the MS. department of the British Museum," who thinks he has convicted the French scholars of a "gross error" in attributing the well-known *Cartes Catalanes* to the fourteenth century. I feel inclined to say a word in answer to this letter, because I think our neighbours are attacked on very slight grounds, and because it appears to me the writer shews some presumption in speaking too confidently on a subject with which his acquaintance is evidently very imperfect, and on a document in a language which he evidently does not understand. I presume, as it has been used by a person in the MS. department, that Buchon's lithographed copy of these *cartes* is in the British Museum: but if so, it appears that it is not yet accessible to the common reader; and I can only speak of them from the description and extracts given by Paulin-Paris, whose judgment of the age of MSS. is not to be despised. The first two *cartes* appear by this description to be covered with astronomical and cosmographical doctrines, exactly such as I should expect to find in the fourteenth rather than in the fifteenth century, when they had been superseded by a somewhat different class of such productions. Among other things we have, not as Mr. Holmes seems to think, a table in which "the calculations of Easter-day begin in 1375," and in which "it was not unusual to make these calculations backwards as well as forwards." (?) but a circular diagram and table for finding Easter in any years, with directions for its use. The composer there gives an example, and tells you how "in the year 1375 the golden number will fall" in the column marked viii.; then he says, in the place for the golden number opposite this column marked viii., you will find what it will be "in this year 1375." With some little acquaintance with scientific documents of this kind, I will venture to say that I never met with an instance where a date was thus given for an example, in which that date was not the year of the composition of the treatise in which it occurred; and this, to me, is decisive as to the date of the maps in question. Mr. Holmes says there is no dependence upon the French scholars, because some of them had given the maps to the date 1346. It is impossible to acquit him either of great disingenuousness, or of being unable even to guess at the meaning of the language in which these notices are written. In the map of Africa, opposite the cape now called Bojador, it is stated as a thing then in people's memory, that one Jacques Ferer had passed this cape "to go to the gold-river, on St. Laurence's day, the 10th of August, 1346,"—"per anar al riu de l'or [ad rivum auri], al gorn de sen Lorens, qui es a x. de Agost e fo en l'ayn [et fuit in anno] M.CCC.XLVI."

The description of the language of these *cartes*, put together in the letter to which I

refer, is remarkably indefinite and inaccurate. It is said to be "that mixture of dialects, chiefly Spanish and Italian, which was known as the *Romans*' over a great part of the south of Europe, and particularly on the shores of the Mediterranean, where much of it still remains in the *Lingua Franca*." The name *Romans* (more properly *Roman*—lingua Romana, for we call the book written in it *Romans* (liber Romanus), whence our Romance, applied to a work of fiction,) belonged to all the languages formed from the Latin. The Spaniard, the Italian, the Frenchman (whether of the Langue-d'oc or the Langue-d'oïl), the Anglo-Norman, each called his own language *Roman*; the language of these maps is a dialect, and not a mixture of dialects, and it appears to me much such a dialect as would have been spoken by the Catalans in the fourteenth century.

The general arguments adduced by Mr. Holmes amount to very little. They consist principally in supposing this, imagining that, and believing the other. Even supposing him right in most of these suppositions, all that he has discovered is that one or two of the persons who have written on the subject have fallen into an error about a date which has nothing to do with the subject. Perhaps, sir, when I can get a sight of the facsimiles, or otherwise as soon as I have an opportunity of referring to the originals, I may trouble you with a more detailed account of these curious maps of the fourteenth century; and I will then shew you that this is not the only instance of geographical knowledge existing long before the discoveries have been believed to be made on which it depended, even when those discoveries are related by contemporaries. In the meantime, I have the honour to be, with most hearty good wishes for your old and valuable journal,

ONE OF YOUR READERS.

[The foregoing communication was omitted by accident in our last week's *Gazette*. We have since received a letter on the same subject from one of the first geographers in Europe, which we insert with much pleasure, and are happy to be the channel of setting the question so satisfactorily at rest. The importance of the question will appear to every one, when it is stated that *Pinduck*, and, we believe, other points even beyond the limits of modern discovery, are indicated in these maps as known to Europeans, both by name and position, in the fourteenth century.]

To the Editor of the Literary Gazette.

Paris, May 7, 1840.

DEAR SIR,—The *Literary Gazette* has published at full length a letter addressed to the Geographical Society of London, by John Holmes, Esq., "of the MS. department of the British Museum," on the *Cartes Catalanes* in the King's Library at Paris. After having noticed what various late French writers—Malte-Brun, Buchon, Huot, Paulin-Paris, &c.—have asserted concerning the extent of geographical knowledge acquired by the navigators of the Mediterranean anterior to the pretended discoveries, for which so much honour has been attributed to the Portuguese of the fifteenth century; and after having pointed out that the priority of the Catalan voyages is indicated only by geographical charts, and is destitute of other certain historical proof, he undertakes to discuss the authenticity of these charts and their real dates.

"The charts," says Mr. Holmes, "exist in the Bibliothèque du Roi, in a MS., to which Malte-Brun assigns the date of 1346, whereas none of the facts which it is made to prove were understood to have been known until about 1420 or 1430,—a difference of three-fourths of a century. His recent editor, M. Huot, leaving Malte-Brun's original statement

untouched, describes the charts a second time, not recognising their identity, and attributes to them the date of 1374: thus making them answer a double purpose. M. Huot copies a memoir, communicated to him by M. J. A. Buchon, Inspecteur des Archives du Royaume, which had been read before the Institute, and which is the foundation also of M. Paulin-Paris's account."

Mr. Holmes confesses that "he looked at first with some suspicion upon a statement which flatly contradicted the hitherto unquestioned authority of early, if not contemporary, writers;" and the evidence upon which it was founded appeared to him inconclusive in itself, and to be in part based upon gross error. Mr. Holmes, in fact, points out in the assertions of the various authors whom he passes in review some important errors, and we cannot but admit with him that the date 1346, attributed by Malte-Brun to the Catalan Chart in the King's Library at Paris, is not that of the MS. itself; that Cyprus, possessed by the house of Lusignan until Queen Charlotte was made to give it up by the Venetians, in 1480, was not conquered by the Mussulmans in 1375; and, in fine, that there does not exist at Vienna any chart by Grazioso Benincasa dated 1370; as also that the oldest of his that we are acquainted with is of 1463. We might make some further concessions to Mr. Holmes, upon the uncertainty which sometimes attaches itself to quotations of years as examples for the calculating of Easter; upon the difficulty of discriminating between the various dialects of the Romance language of the middle ages; as well as upon the authority of the common opinion, which is in favour of the Portuguese of the succeeding century. Notwithstanding all this, I cannot adhere to Mr. Holmes's opinion as to the probability of a date posterior to 1375 being attributed to the Catalan Chart; and since I have been the first to discover and to specify this date, I cannot but explain my reason for having done so, although Mr. Holmes has had the politeness not to mix me up with the question, or at least has only done so by means of an elastic *et cætera*, for which I am much obliged to him.

As many persons may not be acquainted with all that has been published on the subject of this chart, I will first mention, in a few words, that, among contemporary writers, the first who pointed it out to public notice was Baron Walckenaer, who had compared it with that of the Pizigani of 1367, as well as with another, an anonymous one, of 1384, of which he is the possessor, and which originally came from the Pinelli Library. What he said on the subject in 1803 may be seen in his French edition of "Pinkerton's Geography," which is so much more valuable a work than the original. Malte-Brun also mentions this MS. in his "Précis de Géographie;" and Bowdich, who had seen a traced copy of it at Baron Walckenaer's, also quoted it, but as being engraved on wood, whereas it is in reality a drawing on parchment pasted upon wood. M. Jomard has also made mention of it in his "Remarques et Recherches Géographiques sur le Voyage de Caillé;" every body, up to that time, being agreed in adopting for its date the year 1346, which is indicated in it as the date of a voyage to the Gold River in Africa.

At that period I had myself examined the MS., and I had formed, as to its real date, an opinion which I had afterwards an occasion of noticing cursorily in a note read to the Geographical Society of Paris, and printed in its "Bulletin" for September 1832: my words

being "I believe that I can fix its precise date at 1375."

M. Buchon was preparing at the same time an analysis of the document, which was intended to appear in the "Notices et Extraits des MSS. de la Bibliothèque du Roi," published under the auspices of the Académie des Inscriptions; and it was on the authority of this analysis, which had been communicated to him, that M. Huot inserted a new article upon the subject in his edition of Malte-Brun's "Geography," and that M. Paulin-Paris also made use of it, in 1836, in his work entitled "Les Manuscrits Français de la Bibliothèque du Roi." However, M. Buchon had formally adopted the year 1374 as the certain date, and M. Paris seemed rather to lean to the year 1375, on account of the calculation of Easter. M. Buchon's memoir was printed, but not published, in 1837; and a revision of it having been intrusted to M. Joseph Tastu, who has made the Catalan language his special study, this memoir was reprinted in 1839 under the name of the two authors. M. Tastu has fully adopted the date 1375, which I had determined, and has explained in a note the reasons by which I had been influenced, and himself also, in preferring this number. These reasons are as simple as they are conclusive, and they leave not the smallest room for any doubt as to the certainty of the date in question. I will repeat them in all their simplicity:—

1. The writing is of the fourteenth century, and Mr. Holmes, attached as he is to the "MS. department of the British Museum," ought to be sufficiently acquainted with MSS. to know that it is enough to refer him to an attentive examination of M. Buchon's *facsimile*; which, though imperfect, presents to an experienced eye characteristics that cannot be mistaken.

2. The document itself existed in the library of Charles V. of France, of "wise" or "learned" memory, as is proved by the catalogue of Gilles Malet, his librarian, the original of which is extant at the Bibliothèque du Roi at Paris, and which has also been published by M. Van Praet; and, as Mr. Holmes knows as well as I do, Charles V. died in 1380.

3. The calculation for Easter is made for the year 1375, and some of the subsequent years; whence it follows that the author wrote, at the latest, in 1375. Now the terms themselves in which this calculation is made allow of no hesitation on the subject, and Mr. Holmes, before entering upon a discussion, very curious beyond a doubt, but not well founded, ought to have well weighed these terms printed in the book of M. Paulin-Paris, which he has quoted and criticised; he would have been convinced that, in speaking of the year 1375, the compiler used the term *aguest ayn de mccccxxv*, which is equivalent in Latin to *hocce anno mccccxxv*, or in English to *this year 1375*; while in another passage, where he speaks of the following year, he says, *aguel ayn de mccccxxvi*, that is to say, *illo anno mccccxxvi*, or *that year 1376*.

I do not think that Mr. Holmes, when he sees these proofs, will wish to curtail by a whole century the age of our Catalan Chart. As, however, he appears to have a great affection for the renown acquired by the Portuguese from their navigation along the African coasts, and that this chart irremediably destroys their pretended discoveries beyond Cape Bojador in the fifteenth century, I wish to furnish him with a little bit of consolation for the loss of his illusions on this subject; and this is, that a very learned Portuguese gentleman, the Commander de Macedo, perpetual

Secretary of the Academy of Lisbon, has undertaken to shew, by means of memoirs drawn up with as much critical knowledge as patriotic spirit, that the Portuguese did really navigate along these coasts anterior to the year 1375, and, for instance, that they visited the Canaries before the year 1336. This is the real method of preserving for the Portuguese the merit of the discoveries which common fame has so long attributed to them.

I have the honour to be, &c.

D'AVEZAC.

## ARTS AND SCIENCES.

### ROYAL GEOGRAPHICAL SOCIETY.

MAY 11. Mr. Greenough, F.R.S. President, in the chair.—Read, extracts from the following letters and papers.—1. From Professor Baer, at St. Petersburg, communicating the degree of cold experienced in the steppes by the Russian expedition to Khiva, whence it appears that in latitude 46° the mean temperatures were as follows:—

December..	—17·6	Réaumur.
January....	—13·2	.....
February ..	—16·8	.....

Mean of three Months —16° Réaumur, or —4° of Fahr.

It was, therefore, a winter far more rigorous than that of the interior of Lapland; yet, notwithstanding this excessive cold, the Cossacks of Orenburg suffered no inconvenience, and amused themselves with singing in the midst of the dreadful storms of the steppe, and with the thermometer at —40° of Fahrenheit.—2. From Governor Gawler, dated Adelaide, South Australia, forwarding a map of Mr. Eyre's route from Port Lincoln to Streaky Bay, &c. "The papers sent from time to time," Colonel Gawler says, "will shew that we are rapidly going on with discovery; and the new land found to the eastward fully compensates for the barren ground to the west and north-west. I long to push to the north by Lake Torrens and the Flinders Range; we want but money to go to Port Essington, on the north coast: with 1000*l.* at command, I would be answerable to have a party overland at that place, under God's good providence, in less than nine months. There are here three men, either of whom would do it with sufficient encouragement; they are intelligent, determined fellows, and well acquainted with the country and its peculiarities. There is nothing to fear from the natives, except when beef and mutton are the temptations: from what I have seen and heard of them, I think that six armed men might safely travel in any direction in South Australia, and that generally two would be sufficient. The natives are good tempered, intelligent, and not very daring, but, from vagrant habits, most untameable."—3. "Journey from Angora, by Kaisariyah, Malatiah, and Gergen Kaleh-si to Bîr or Birehjik," by W. Ainsworth, Esq. "After a stay of three months at Angora, in Asia Minor, during which an excursion was made to the mines of Ishik Tâgh, about forty miles to the northward of the city, and lying 4560 feet above the sea, the expedition, consisting of Mr. Rassam, Mr. Russell, and myself, quitted Angora, and travelled to the westward, to explore the Kurdish districts of Haimânah. In the course of the journey we passed through Istânos to Mislû, near the banks of the Sakiriyah, a distance of about forty-five miles; thence turned S.S.E. for fifty miles, to Kizil-jah Kaleh; again E.N.E. for fifty miles, to the Galena mines of Denek Maden, which lie 3340 feet above the sea; from this point we turned nearly south for seventy miles, through Uch Ayak and Kir Shehr to Neu-Shehr; again

north-west for thirty miles, rounding the northern end of the Great Salt Lake of Tuz Chuli, and continuing along its western shore a general S.S.E. course of eighty miles, brought us to Ak Serai. From this point we travelled by Kaisariyah, Gurun, and Derendah, and the little-known valley of the Tokmah Sü, to Malatiyah, a further distance of 200 miles; thence, in a southerly direction, passing by Beani, Gurun, Kalah-si, and Samei, by the Nushan pass, through Mount Taurus to Bir or Birehjik, on the Euphrates, completing a journey of upwards of 1000 miles, chiefly through a country very imperfectly laid down on all existing maps. The town of Istánós contains about 400 houses—50 Mohammedan and 350 Armenian; it occupies the right bank of the river, and, confined by the cliff, forms a long narrow street, which is well stoned up, like a quay, and adds to the general appearance of comfort and cleanliness. A curious rock, almost insulated from the cliff, advances over the lower part of the town. It is crowned by ruins of olden time, covered with storks' nests, and burrowed by cavernous passages, difficult to reach. Neú-Shehr is a pleasing and cleanly town, situated at the side of a bold ravine, and itself rather darkly backed by high cliffs of volcanic rocks. The Greeks, who form a considerable portion of the community here, appear to have congregated into the 'new city' for all the numerous and various troglodyte villages in the neighbourhood are now, for the most part, abandoned by their original occupants. Neú-Shehr contains 2000 houses of Mohammedans, 800 houses of Greeks, sixty houses of Armenians, two large jámis, one Greek church, nine kháns, one bath, six Mohammedan schools, and a quadrangular castle, with round towers at the angles. In a commercial point of view it is, when compared with other towns of the interior of Asia Minor, a very flourishing place. Up the ravine is the small village of Górah; and downwards, at a short distance, the picturesque troglodyte village of Már, or the pomegranate. Neú-Shehr is in latitude 38° 37', and at a mean elevation of 3940 feet. The view of the Great Salt Lake of Kóch Hisár from the entrance of the pass was very beautiful, but it wanted wood. Narrow at the north, where it is backed by low hills, it subsequently expanded almost beyond the reach of the eye; is next lost behind the hills of Inja Burnu, a small cape to the south-west; and reappears to the south as a wide and distant expanse of waters, backed by lofty summits, which are, however, in reality at a great distance beyond the extremity of the lake.

"April 18th.—In the sheltered and sunny exposure of Kóch Hisár, many flowering plants welcomed us at once to spring. The castle, from whence this place derives its name, signifying 'Sheep's Castle,' occupies the top of a hill, which is nearly isolated from the remainder of the range, and commands, according to olden ideas, the town and the entrance to the pass of Kazi Hayuk. The foundations of the castle are now difficult to trace: the loose stones are piled up into so many sheep and goat-folds, whence its modern name. The present village of Kasabah contains 130 houses, but no resident Christians. Here are saltpetre works. A mer. obs. gave its latitude in 38° 55' 50" north; approximate elevation, 2856 feet. The eastern banks of the lake are tenanted by pastoral Turkománs of quiet habits, but the western side is inhabited by Kurds, who are constantly giving trouble to the government by their predatory habits. We met with some difficulty on approaching the lake from the north-west; but once on its banks, we were

resolute in following the yet unexplored western line; in doing which we approached near to the southern acclivities of Karájah Tágh, the northern front of which we had also visited in our excursion through Haímánah. The lake, which is almost dried up in summer, was nearly at its greatest extent at the period of our visit, and consequently well adapted for an explanatory recognisance. To the north, north-east, and north-west, where it receives no large tributaries, it is entirely dry in summer, and its limits are well defined by the absence of vegetation, and the coating of salt and mud; but in its south-western and southern limits, where it receives several large streams of fresh water, which are marked on the map, the plain being, as has been mentioned, very level. Far beyond the limits of the lake the tributary waters spread themselves out, converting the whole land into extensive marshes; so that, between marsh in winter, and salt desert in summer, it is difficult to find out what may be considered as the southern boundary. But as the line of our route extended to pretty nearly the point where all the southernly rivers, except the Beyáz-sü, spread out into marshes, and that line is again connected with Kóch-Hisár, by the labours of Mr. W. I. Hamilton, as good an idea of the real extent of a lake, constantly varying in the details of its form, may be obtained, as if its exact limits to the south had been astronomically fixed. A series of barometrical observations gave for the mean height of the lake above the sea 2509 feet. The lake contains no fish, nor molluscs, nor conchiferous animals; its waters and its banks are, therefore, frequented by few aquatic birds. Although constantly on the look-out, we cannot say that we ever saw one bird on its bosom, although the story of birds not being able to dip their wings in the waters is evidently fabulous. The state of saturation is, however, very great, for the salt is collected at almost all seasons from the bottom of the lake, and washed in its waters without any sensible loss by the process. Ak-Serú contains 800 Mohammedan, and 10 Armenian houses. It derives its chief interest from its numerous Saracenic remains, some of which are of great beauty. It was evidently a considerable town, and a place of opulence under the Arabs, probably at the time when so much care was bestowed upon the great road passing by Sultán Khán. The noble mountain of Arjish, the ancient Argæus, is now clearly proved to be the loftiest eminence in Asia Minor. Almost perpetually involved in clouds, during our stay at Kaisariyah, we had only an occasional glance at its extreme summit; and at the same season of the year the snow line, descending to within a few hundred feet of its plain, put all attempts at an ascent out of the question. The structure of this fine mountain, which, like Hasan Tágh, is principally of volcanic origin, and belongs to a comparatively modern epoch of activity, will be best described by Mr. Hamilton; but the whole, in a general point of view, presents an interesting accumulation of conical, rounded, and saddle-backed hills, chiefly composed of grey friable lavas, with a basaltic base. The manner in which these various formations are dispersed about the declivities is rather remarkable, and always very distinct. The summit of Arjish appears to be about ten miles from its average base, considering it for the moment to be isolated on every side, which it is not to the south-east. This would give a mean area for the whole mountain of 300 miles, and a circumference of sixty. Its elevation, as determined by Mr. Hamilton, is 13,000 feet. The report

that both the Euxine and the Mediterranean may be described from its summit, given by Strabo (p. 538), must be received with caution, since its distance from the Euxine is 270 British miles, and from the Mediterranean 110 geographical miles, with ridges of high mountains between both. There is also a tradition that the Romans had a castle on its summit, where Tiberius Cæsar used to sit, which is not deserving of attention, except as probably connected with the adjacent summits of 'Alí Tágh or Ulánlí."

This paper was illustrated by a map of the route on a large scale, and by two sections of Asia Minor, drawn by Mr. Russell from barometrical measurements, and tinted to express the great geological features. One a longitudinal section from Constantinople, in an E.S.E. direction to the Euphrates at Bir; the other latitudinal, from Samsún, on the Black Sea, to Iakanderún, on the Mediterranean—a distance of 270 miles in a nearly north and south line. —The chairman announced that the anniversary meeting of the Society would be held on Monday, the 25th instant, when the gold medals awarded by the Council would be presented, and the President would deliver his annual address.

## BOTANICAL SOCIETY.

FRIDAY, May 1st. Mr. D. Cooper, Curator, in the chair.—Read, 'A Congratulatory Address to Her Majesty and Prince Albert, on their Marriage,' which was unanimously adopted. —Exhibited, specimens of *Hutchinsia petraea*, from Eltham, Kent, by Mr. Sansom.—Read, the second part of 'A Monograph on Ferns,' by Mrs. Riley, embracing the arrangement and classification of the British ferns, and the best assistances to their study: not suggesting any new arrangement, but shewing how they who have paid attention to the subject for years have already classed and arranged them; pointing out which of those arrangements observation has induced Mrs. Riley to think most correct; and, by comparison one with the other, shewing where differences exist. The first natural subdivision of the British ferns is that of *Annulata*, comprising the ferns which produce their fructification on the back or margin of the leaf or frond; their capsules being provided with a jointed, elastic ring, which springing open when ripe disperses the spores; and that of *Exannulata*, those which bear their fructification on a simple or branched spike, their capsules being destitute of the elastic ring. The first section consists of two families, *Polypodiæ* and *Hymenophyllæ*, and the second of *Osmundæ* and *Ophioglossæ*. After describing the other divisions, and the peculiarities upon which they depend, as formed by Ray, Tournefort, Plumier, Linnaeus, Sir J. E. Smith, Swartz, Willdenow, Sprengel, Brown, and Presl, and explaining the terms principally employed by writers on ferns, Mrs. Riley gave an analysis, shewing Smith's arrangement with Hooker's additions, and subjoined a list of their names, arranged according to Smith's "English Flora," with their synonyms, as given by Hooker and Presl. This collection, or tabular arrangement, is very conducive to an easy understanding and acquaintance with this interesting family. In pointing out the best assistances to the study of ferns, both British and foreign, after enumerating the many works upon the subject, Mrs. Riley observed that the herbarium of the Botanical Society would afford the opportunity of testing the correctness of their specific names: but the ferns alter so much

at different stages of growth, and are so susceptible of change in appearance from difference in the locality, that botanists frequently receive specimens that would seem to run half-a-dozen species into varieties of but one. Established figures are therefore the more necessary. Mrs. Riley recommended the coloured engravings of the British ferns in Smith's and Sowerby's "English Botany," for the study of this branch of the science. Mrs. Riley's paper evinced extensive research, and a thorough knowledge of the subject.

#### ROYAL BOTANIC SOCIETY.

MAY 12th. Fred. J. Jarre, M.D. in the chair.

— The tables were covered with a very numerous collection of donations of seeds, dried plants, books, &c. Mrs. Hudson Gurney. Sir Thomas Baring, Bart., John Labouchere, Esq., Sir James Clarke, Bart., and thirty other ladies and gentlemen, were elected fellows of the Society; and Mrs. Trotter, Mrs. Leake, Mrs. B. Bond, and Miss Parry, were elected members. An interesting paper was then read by Dr. Sigmond, 'On the Progressive History of Botany.'

#### ENTOMOLOGICAL SOCIETY.

APRIL 6th. The Rev. F. W. Hope, President, in the chair. — Numerous donations were announced as having been forwarded to the Society, including a splendid collection of insects, chiefly from the Neigherries, presented by Mr. Robertson. Professor Owen exhibited a *Dipterous larva* from the urinary discharge of a patient, and which had lived two days after its exclusion; another was discharged after an interval of five weeks. He considered it exceedingly difficult to account for the presence of such an insect in this situation, as it was next to impossible that it could have passed from the intestinal canal. The larva was of a species distinct from those described by the Rev. L. Jenyns, in the "Transactions" of the Society, under the name of *Anthomyia canicularis*, being destitute of the remarkable filamentous processes observed in that species. Mr. Westwood exhibited a considerable number of insect monstrosities, including a specimen of the Tortoiseshell butterfly with five wings, from the collection of Mr. Stephens; an *Aspilates gilvaria*, with the two wings on one side confluent; a *Prionus*, with eight tarsi, &c. This exhibition led to various remarks on the physiological peculiarities of the insects exhibited. Mr. W. W. Saunders exhibited the nest of a *Hymenopterous insect* made of mud, which is built on the corners of rooms of houses in Albania, sent home by Mr. G. S. Saunders. An American species of the same genus (*Polopæus*) was stated by Mr. Shuckard to be well known in the United States, under the name of *Mud-dabs*. Mr. Saunders was therefore led to doubt the correctness of the observation which he had made in India, as to the parasitic nature of these insects. Mr. Newport mentioned the case of the larva of an *Æstrus*, which had been obtained from the frontal sinus of a female patient.

May 4th. The Rev. F. W. Hope, President, in the chair. — Mr. Yarrell exhibited specimens of the larve of *Tipula olivacea*, which are destroying the grass-plots in Golden Square; and Mr. Hope stated that lime-water and the water obtained from gasometers were efficacious in destroying them. Mr. Newport exhibited a species of *Glophitus*, which had been voided from the stomach of one of his patients. Likewise a specimen of the pupa of the privet hawk-moth, which was destitute of an exerted

tongue-case. Mr. Newport having repeatedly disturbed it by touching its head at the moment of its passing from the larva to the pupa state, at which time the elongated maxillæ are developed. Mr. Hope exhibited a new species of walking-leaf insect from Neigherries. Mr. Shuckard read some extracts from a monograph, on the family *Dorylida*, now in course of publication; and Mr. Westwood some notes 'On the Peculiarities of African Entomology,' which led to an extended discussion, in which Messrs. Hope and Waterhouse stated their views on this branch of the science.

#### ELECTRO-MOTIVE POWER.

To the Editor of the Literary Gazette.

SIR,—In your last Number there is an account of an electro-motive machine exhibiting at the Colosseum, for which it is stated that an American gentleman has taken out a patent. This machine seems to owe its increased efficiency to its larger size (as compared with previous ones) and to the employment of Grove's powerful voltaic battery; but, in other respects, it appears not to differ in principle from those which have been known to the scientific world for the last four or five years. I, therefore, beg leave to inquire in what the novelty of this machine consists, or on what the patent is proposed to be sustained? A very great variety of electro-magnetic machines have been described, none of which, of course, can now become the subject of a patent, especially as working models of them have been frequently exhibited.—I am, Sir, your obedient servant,

X. Y. Z.

#### PARIS LETTER.

Academy of Sciences, May 12, 1840.

MAY 4. *Preservation of Wood*.—M. Arago read a long extract from a memoir by M. Boucherie, of Bordeaux, on the preservation of wood from decay, on the keeping of it in a state of greater or less humidity and elasticity, and on the colouring it, by the injection of pyroligneous salts, and other saline or metallic substances. M. Boucherie recommended, as the result of his experience of several years' experimentation, the pyrolignite of iron, as one of the cheapest substances and one of the most effectual for exsiccating timber, and for changing into insoluble substances the humid and soluble matters that always remain even in the longest dried wood. His method was to place a piece of timber, within forty-eight hours after it had been cut, into a pyroligneous solution, and the capillary action of the tubes of the wood immediately absorbed an immense quantity of the solution. Thus, a poplar-tree, twenty-eight metres in height, and forty centimetres in diameter, the foot of which was plunged in only twenty centimetres of pyrolignite of iron at 8°, was penetrated in every part by this liquid, and in six days had absorbed three hectolitres of it. It was not necessary that the tree should be kept upright for this absorption to take place, nor even that the tree should be cut down. M. Boucherie had found that by boring a hole through the tree, and making some lateral incisions with saws, and then, by forming a kind of trough round it, so as to allow of liquid entering the hole, the absorption went on with the same rapidity. The time for cutting trees to apply this method of injection to them, or for operating on them by means of incision, was the autumn, not the winter, as had been commonly recommended. All sorts of liquids could be introduced into timber by methods of this kind, except vegetable solutions, which many species of wood refused to absorb altogether; and, in general, the neutral liquids

were drunk up more abundantly than acid or alkaline solutions. The central parts of all timber being more close in their grain than the outer parts, never absorbed so much liquid as the latter; and among the harder kinds of wood there was a remarkable difference of their powers of penetrability. Some kinds of oak were found to be penetrated to three-quarters of their mass, others to only one-tenth. Branches of trees the moment they were cut commenced absorbing air, and M. Boucherie, by means of a simple apparatus, had ascertained that a branch would absorb five times its own volume of air. The method of injection was of use for preserving timber in a humid, and therefore elastic state: it was known that certain salts would preserve instead of destroy the soluble substances contained in timber, and the refuse-water from salt-pans had proved to be one of the most effectual substances for this purpose—a result of importance, since this water had always been considered useless. In order to prevent wood from shrinking, it was necessary that full two-thirds of the original moisture of the tree should be preserved in the timber; and by means of a deliquescent chlorure, M. Boucherie had succeeded in producing the effect desired. Wood had also been made difficult to burn by the injection of an earthy salt; and two huts having been built, one of wood so prepared, the other of ordinary wood, and then set fire to, the former was only smothering with the fire when the latter had been entirely consumed. Wood might be tinted by the injection of two liquids, one after the other, which, by their mutual action after absorption, produced a colouring matter: thus some wood had been dyed a magnificent blue, by allowing it to absorb successively a salt of iron and the prussiate of potash. This property of injection, by preserving wood from all attacks of insects, was stated by M. Arago as likely to be of immense importance in the French dock-yards, where the ravages of insects, especially the termites, were tremendous. At La Rochelle the insects had extended their ravages into the town, and forty houses had been more or less attacked by them: even the public record office had not escaped from their ravages. In Paris, too, the new galleries of the Garden of Plants were stated to be much attacked in their timber-work by insects.

M. Séguier presented a report on improvements in naval steam-engines, proposed by M. Jauffroy: the principal change consisted in giving a kind of alternating longitudinal motion to paddles, not arranged on wheels, so as to imitate the action of the webbed feet of swimming birds.—A favourable notice was read upon the *planimètre*, invented by M. Lalanne; a kind of calculating machine, useful in operations of embankment-making, canal-cutting, &c.

A letter was read from M. Bessel, stating that he had been able to determine exactly the parallax of the sixty-first star of *Cygnus*, being  $\frac{34}{1000}$ th of a second: this would give for the mean distance of this double star from the earth, 582,000 times the radius of the earth's orbit; whence it followed that the light of this star must be about nine and a half years in reaching the earth.

M. Bravais, one of the members of the last scientific expedition to the north of Europe, sent in a memoir upon certain lines indicating former levels of the sea observed in Flinmark. These lines, which he had followed for considerable distances along the coast, were neither horizontal nor parallel to each other; and from this he inferred the partial elevation of the coast at various distinct epochs.

M. Peltier communicated the results of some experiments on the atmosphere during the calm, hot days of April last, which he had made by means of a kite with a copper wire of 400 metres in length, an electroscope, and a multiplier of 3000 turns. It was only at a height of about forty metres that the multiplier began to give signs of a positive current; above 100 metres the current increased rapidly in power, and once carried the needle round to 90°. The results were uniform while the sky continued unclouded, but the intervention of clouds caused a negative zone at from 50 to 70 metres in elevation, above which a positive current was again found.

A memoir, in German, was sent to the Academy, on the nature of the odour caused by electric machines in action, and also by electric discharges from clouds in cases of storms. It was remarked, that in the voltaic battery this odour was developed only at the positive pole; and, from various experiments on the air, it was concluded, that there existed in the air an odoriferous substance, chemically combined with hydrogen, and which the decomposing power of electricity tended to set at liberty.

The second meeting of the Italian Scientific Association, the title of which is announced by the official Gazette of Turin, as "Seconda Riunione degli Scienziati Italiani," is to take place on the 15th of September, 1840, and is to last till the 30th of the same month. Turin is appointed for the meeting: the office for the admission of members will be opened there on the 10th of September: the two "assessori" of the meeting are Professor Francesco Rossi (Vice-President of the Royal Academy of Sciences of Turin, and President of the College of Surgery in that university), and Professor Angelo Siamonda (Professor of Mineralogy, and Director of the Mineralogical Museum at Turin). The notice is signed by the President-General, Count Alessandro di Saluzzo, and the Secretary-General, Professor Giuseppe Gané.

*Sciara da.*

Fuggendo crudascena il mio primiero  
Cercò nell' onda disperato morte;  
Carco d' iniqua accusa e di ritorre,  
La ritrovò il secondo nell' infero.

Answer to the last:—Empi-reo.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, May 7.—The following degrees were conferred:—

*Bachelor in Divinity*.—Rev. J. Ley, Student of Christ Church, and the late Sander Proctor.

*Masters of Arts*.—Rev. F. Menzies, Fellow of Brasenose College; Rev. W. F. Pickering, Demy of Magdalen College; Rev. W. H. Gunner, Rev. J. G. Hickey, Trinity College; Rev. J. B. Wickes, St. John's College.

*Bachelors of Arts*.—R. K. Bailey, New Inn Hall; C. H. Moncell, Worcester College (incorporated from Trin. Coll., Cam.), Grand Compounder.

CAMBRIDGE, May 6.—The following degrees were conferred:—

*Honorary Masters of Arts*.—Viscount Newport, Trinity College; Viscount Clive, Hon. G. P. S. Smythe, St. John's College; F. L. Pym, Trinity College.

*Masters of Arts*.—J. Hemery, Trinity College; S. W. Wanton, H. O. Wood, St. John's College; E. Selwyn, Catharine Hall; G. A. Clarkson, Jesus College.

*Bachelor in the Civil Law*.—E. W. Michell, Queen's College.

*Bachelors of Arts*.—H. B. Smith, C. Lawford, W. Cockburn, C. H. Wilson, G. C. Hawker, Trinity College; E. Everett, H. Maibay, Rev. F. Maul, St. John's College; A. Ghirel, Clare Hall; H. Clavdon, W. H. Child, Caius College; J. Foy, Trinity Hall; F. Williams, W. Bell, Corpus Christi College; J. Sheldon, Catharine Hall; L. A. Beck, Jesus College.

##### SOCIETY OF ANTIQUARIES.

MAY 7th. Mr. Hamilton in the chair.—Mr. Coombs exhibited a rubbing from a monumental brass in Hever Church, Kent, to the memory of Sir Thomas Boleyn, Earl of Wiltshire.—Mr. Sidney Smyrke exhibited

drawings of the Bell-tower of the Chapel of S. Gottardo, at Milan, accompanied by a description, and observations on the architecture.

—Mr. Halliwell communicated a second paper, 'On the History and Events of the Reign of Edward IV.,' from two contemporary MSS. discovered since his former communication on the same subject, at Lambeth,—part of which being read, the remainder was postponed.

May 14. Henry Hallam, Esq. Vice-President, in the chair.—Mr. John Gough Nichols exhibited a beautiful drawing of the sepulchral effigies of Richard II. and his Queen, Anne of Bohemia, in Westminster Abbey, made by Mr. Thomas Hollis, in nearly half the scale of the originals, in order to shew the singularly curious and elegant manner in which it has been discovered that the royal robes are adorned with various cognisances and other devices, as the White Hart, the Broom-plant, the Ostrich of Bohemia, &c. &c. These ornaments have been utterly unknown, from the accumulated dust of centuries. The reading was continued of Mr. Halliwell's 'Observations on the History of certain Events in the Reign of Edward the Fourth,' illustrated by various original documents. The Duke of Argyll was present at the meeting, and exhibited three bracelets of solid gold, found in Scotland. Two of them terminate in the two cup-like ends, like the larger sort of those articles found in Ireland, which Sir William Betham has classed as ring-money.

##### CAMBRIDGE ANTIQUARIAN SOCIETY.

THE first meeting of this Society was held on Thursday the 7th inst., at the lodge of St. John's College, the Rev. Ralph Tatham, D.D., Master of St. John's, and Vice-chancellor of the University, President, in the chair.—Sir Thomas Phillips, Bart., and several gentlemen not members of the University, were proposed as ordinary members.—M. Guizot, Professor Von Huber, of Marburg, and J. G. Nichols, Esq. F.S.A., were proposed as honorary members of the Society.—Presentations were announced from Sir Henry Dryden, Bart., the Newcastle Antiquarian Society, Dr. Thackeray, the Rev. J. J. Smith, and others. The following communications were read.—1. 'A List of MSS. in his Collection relating to Cambridge,' by Sir Thomas Phillips, Bart. M.A. F.R.S. 2. 'A Measurement of Part of Ely Cathedral in the 13th Century, from a MS. in the Cottonian Collection,' by Sir Thomas Phillips, Bart. 3. 'A Catalogue of the Books given to Catharine Hall by the Founder,' by the Rev. G. E. Corrie, Norrisian Professor of Divinity. 4. 'The Statutes of King's College in Latin, with an English Translation,' by James Heywood, Esq. F.R.S. 5. 'A Copy of an Abbreviated Chronicle, from A.D. 1377 to A.D. 1469, containing Curious Notices of University Proceedings,' by the Rev. J. J. Smith, Fellow and Tutor of Caius College, and Treasurer of the Society. 6. 'A Legendary Account of the Foundation of the Town of Cambridge, from a MS. in Lambeth Palace,' by James Orchard Halliwell, Esq. F.R.S. of Jesus College, Secretary of the Society. 7. 'A Poem, entitled 'Ebristatidis Compendium,' by Henry Rogers, Fellow of King's College in the early part of the 17th Century, from MS. No. 83 in the Library of the Royal Society,' by Mr. Halliwell. Mr. Deck exhibited to the Society several relics of Roman antiquities found in the neighbourhood of Cambridge. Sherman's "History of Jesus College," which has recently been published under the auspices of the Society, edited by Mr. Halliwell, the Secretary, was announced

as ready for delivery to the members. We trust that the praiseworthy endeavours of this well-planned Society, thus cheerfully commenced, will be well supported by members of the University.

##### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—Statistical, 8 P.M.; British Architects, 8 P.M.; United Service Institution, 9 P.M.; Medical, 8 P.M.  
Tuesday.—Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
Wednesday.—Society of Arts, 7 P.M.  
Thursday.—Royal, 8 P.M.; Antiquaries, 8 P.M.  
Friday.—Royal Institution, 8 P.M.

##### FINE ARTS.

##### GRAPHIC SOCIETY.

THIS agreeable Society closed its seventh session on Wednesday last, by a numerous meeting of members and visitors, and by a display of numerous drawings and sketches: the chief contributors were Mr. Stanfield and Mr. Uwins. Many beautiful drawings and studies by the former, made during his recent journey in Italy; and of the latter, were some fine drawings by the old masters—drawings made by the Sketching Society, and numerous drawings and studies of his own. Many photographs by Mr. Talbot,\* far superior to any before shewn by him; and some proofs of the application of vortatype, or electrototype, to the production of facsimiles of engraved copperplates,—impressions from both the original and the vortatype plates were shewn, and it was impossible to distinguish a difference. This will probably become one of the most important aids to art of modern discovery, for it will guarantee perfect impressions from the original plate to any extent; for, though steelplates will often produce good impressions to the amount of 5000 or 6000, it also often happens that they fail at 1000 or 2000, and require repairs. By using the vortatype plates, as soon as one betrays wear, it may be thrown aside, and a new plate, made at a trifling cost, substituted. Thus to any extent the impression may be equally good, and this cannot fail to give confidence to the public in purchasing illustrated works. We have heard that Mr. Brockedon, in his new work 'On Italy,' which we lately announced as preparing for publication, contemplates producing it by this new and beautiful process; and it is highly probable that, during the next session of the Graphic Society, many proofs will be given of the value of electrototype to the Fine Arts.

##### PHOTOGENIC DRAWINGS.

WE have been gratified by an examination of a series of photogenic drawings, which Mr. Fox Talbot has produced during his spring residence in the country; and certainly they are not only beautiful in themselves, but highly interesting in regard to art. The representation of objects is perfect. Various views of Lacock Abbey, the seat of Mr. Talbot; of Bowood; of trees; of old walls and buildings, with implements of husbandry; of carriages; of tables covered with breakfast things; of busts and statues; and, in short, of every matter from a botanical specimen to a fine landscape, from an ancient record to an ancient abbey, are given with a fidelity that is altogether wonderful. Some resemble Indian ink drawings, others sepia, and others engravings, and all are facsimiles of the subjects thus transferred to the paper. These differences arise from alterations in the chemical media; and Mr. Talbot has now succeeded in fixing them safely and permanently. Among the curious effects to be observed is the

\* Noticed elsewhere.

distribution of lights and shades. The former, in particular, are bold and striking, and may furnish lessons to the ablest of our artists. The crystal bottles on the breakfast-table are also well worthy of attention; their transparency is marked with singular truth: but, indeed, there is nothing in these pictures which is not at once accurate and picturesque. The Album, and separately framed specimens, were to be shewn at the Graphic Society; where, no doubt, they would meet the same admiration with which we inspected, and excite the same sense of their value as hints and models upon many points connected with perspective, chiaroscuro, and minute detail, combined with great general effect.

## ROYAL ACADEMY.

[Second notice.]

55. *VENICE: the Bridge of Sighs*; 71. *Venice, from the Canale della Giudecca, Chiesa di S. Maria della Salute, &c.* J. M. W. Turner, R.A.—Venice! Venice! Venice! we were about to add, *toujours perdra*! It may come to that at last, though we have too much respect for the talents of the painter to limit his choice of subject or stint the application of his powers. One thing, however, seems certain, that there has been neither stint nor limit set by our artists themselves in their sketches of this famed city; and of that liberty Mr. Turner has certainly taken his full share, and, as if in return for the favour, he has white-washed the buildings: for such is the appearance of the marble fronts of some of them, as they are here represented; and this is one of the most remarkable features of the picture. But, in 203. *Slavers throwing overboard the Dead and Dying—Typhoon coming on*, it is quite another thing; all here is on fire; the spirit of destruction is abroad, and the eyes pained and dazzled in gazing on the horrible scene: to remedy which, however, it is only necessary to look round on the quiet and intellectual subject, of “Milton dictating to his Daughters.” Connected with the subject of Slavers and Slavery, we are called upon to notice 441. *The Slave-Trade*. L. Biard.—We have said of Mr. Callcott's picture, that we think the subject is henceforth set at rest: we say the same of this able production. The dreadful circumstantiality of its details is indeed appalling. Among them is the application of the branding-iron to a newly purchased slave; the smoke is issuing from the heated instrument, while the planter-purchaser is lying at his ease, looking on with the most imperturbable apathy! In the centre of the picture there is a dispute respecting the body of a dead negro;—one is opening the mouth to ascertain the probable age of the wretched victim; another applies his hand to the heart, to discover if pulsation has wholly ceased; while the countenances of the disappointed black slave-dealers, selling their own flesh and blood as it were, express the most horrid feelings that malice and fury can exhibit. Occurrences of equal barbarity are proceeding in every part of the canvass, and are represented with a skill in the execution that renders them much too painful for contemplation.

Mr. Biard has another painting, 20. *Crossing the Line*, no less skilfully treated, but full of the savage mirth and brutal humour which are tolerated on such occasions.

197. *Titian and Irene da Spilembergo*. W. Dyce.—All here is *en couleur de rose*; brilliant and beautiful, and a fine example of the florid style of art. A quotation explains the characters of the subject, but the artist has treated it Watteau-like, or as a group in a *fête champêtre*. The fair damsel is seated on a bank, amidst

flowers and sunshine; Titian has thrown himself on the grass beside her, and is directing her attention to some object out of the picture. It is a work attractive and pleasant to look upon, but devoid of any particular interest.

288. *Leaving the Ball*. J. C. Horsley.—From Goldsmith. 'Tis early morning; the new moon is still visible; market girls with their baskets are seen in the distance; while a young and gallant officer is leading to her carriage a gay and blooming beauty. This is the bright side of the picture. On the right, and in the shade of the building, sits a disconsolate one with her orphan infant, and to whom the lines in the quotation distinctly apply; but her look of silent anguish none but the painter could give.

328. *Punch*. T. Webster.—And we shall add, “Judy,” as our readers, not seeing the picture, might suppose it to be the still-life representation of a bowl of punch; and no mixture of that kind could inspire half the mirth here represented. The population of a whole village is redolent of enjoyment, from the nightcapped grandfather to the volatile and scampering schoolboy. Laughter has infected them all. With them the cup is full: could operas or plays do more?—could they do half as much? The scenery comprises an ample space of ground, which is every where filled with pictorial objects of country life, pleasant to the eye and soothing to the mind.

230. *A Subject from the Parable of the Ten Virgins*. W. Etty, R.A.—There is not a more awful warning in the Gospel history than this parable presents;—it is equally applicable to this life and that which is to come. Mr. Etty has illustrated the passage in a very striking and original way. Nothing can exceed the imploring attitudes of some, and the prostration and despair of others, who are left without to bewail their miserable negligence. In the whole performance we recognise many of the finest qualities of art, in respect both to colouring and execution.

242. *The Orphan and his Bird*. W. Allan, R.A.—What Crabbe was in verse, Mr. Dickens is in prose; his graphic descriptions, whether humorous or pathetic, are drawn from the life. Of the latter class, Mr. Allan has availed himself with good effect. The poor orphan and his dead bird tell a melancholy tale; and the desolate character of the scene—a wild waste under the influence of fading light, is in perfect accordance with the subject.

484. *Altar-piece for St. George's Church, Leeds*. C. W. Cope.—The talents of this artist have been frequently the subject of encomium in the pages of the *Literary Gazette*. In the present instance, he has fully borne out our former commendations, and that on a very ample and extensive scale. The picture, in some respects, reminds us of the “Transfiguration,” by Raphael. Christ, in his beatified character, is represented as “making intercession for us.” The cross, emblematic of his sufferings, occupies the centre of the piece, at the foot of which is seen the figure of a female (it may be the Magdalen), clinging to, and embracing the object of human deliverance, while others are looking up with hope to the same source; and an aged man on the right is pointing out to a convert from a distant land the means of grace and pardon. The body of the cross is partially enveloped in clouds, but its complete form appears above. As a figurative representation of the consoling doctrines of Christianity, as well as an example of the British School of Painting, the picture is deserving of every praise.

482. *Prince Charles Edward and the High-*

*landers entering Edinburgh after the Battle of Preston*. T. Duncan.—We noticed this clever painting when it was privately exhibited at Mr. Moon's. The public will now have the opportunity of judging whether we did more than justice to its merits.\*

[To be continued.]

## SOCIETY OF PAINTERS IN WATER-COLOURS.

[Concluding notice.]

184. *A CONSULTATION*. J. Crisall.—Artists should remember that we Cockneys, when introduced to subjects of this kind, require something in the way of explanation. We see, indeed, a mountain pass, with herds, dogs, and drovers, climbing the rocky ascent, at the foot of which a group of peasants, young and old, appear holding a parley; but whether to consider the dangers of the route, the price of cattle, or the probable length of their absence, “A Consultation” saith not. It is, however, a clever performance by this veteran and venerable painter, partaking of both the pastoral and the romantic.

251. *David Deans*. A. Chisholm.—A Rembrandt-like effect. The interior of the old man's cottage, his venerable countenance and pious employment, suit well with the idea conceived of his character by those who have read the works of the gifted writer, whose graphic pen has furnished so vast a field of subjects for the pencil.

99. *Half-way House*. G. Barret.—It matters not to what place; the artist has gone the whole way in giving a beautiful and quiet effect of moonlight to the road scene of the half-way house: but neither morning, noon, nor night, will ever find Mr. Barret out of his way. Let the visitor look at 36. *English Pastoral*; 243. *Cattle—Afternoon*; and 269. *Fine Afternoon*, and he will be satisfied of the truth of what we say.

110. *Loch Long, Scotland*. H. Gastineau.—To one of the most sublime scenes in nature the artist has imparted a majestic and solemn effect. The moon, emerging from a dark cloud, casts a gloomy and partial light on the objects beneath. We almost fancy we can perceive her motion.

18. *The Reverie*. H. Richter.—This, among Mr. Richter's various characteristics of female grace in *contour* or countenance, is, we think, the best example, as well for its expression as for the purity of its colouring. The white drapery and flesh, which are here brought together, are in perfect harmony with the subject—clear and pure.

31. *Rhaiadr y Mawdach, North Wales*. W. Neafield.—We must certainly learn Welsh, or get an interpreter to help us out in the names of things as well as places. The picture says waterfall, as plain as it can speak; but whether the title signifies this we shall not stay to inquire, and only observe that the fall is one of the most beautiful of its kind. It does not come splashing and dashing, as some we have seen, though it may in its time have had something to do with the wear and tear of the rocks through which it now glides (quietly to the eye). We suspect, however, from the mists which rise on each side, it can make itself heard. Be that as it may, its downward path, and the clear expanse which

\* Our critique not having yet overtaken some of the noblest pictures in the Exhibition,—those painted by Stanfield,—it affords us great pleasure, meanwhile, to mention of that highly-gifted artist, that her majesty sent for him a week ago, and gave him a commission to paint two pictures for her. Our sea-girl and its naval glories could have no illustrations more worthy of royalty than his palette is sure to produce.—Ed. L. G.

receives its waters, are pleasant objects for sight or contemplation.

89. *The Portrait Gallery: Hardwick Hall, Derbyshire.* D. Cox.—Those who built this gallery must have had, or intended to have, a very, very long line of family pictures; for such is the length in its perspective appearance, that on viewing it, a game of cricket in this same hall came involuntarily into our mind as a very suitable amusement. Considering this remark to be a high compliment to the performance, we need say no more on the subject.

44. *Greenlandman bearing up to leave the Ice—full Ship.* 258. *Dover Pilot Lugger returning to Port.* G. Chambers.—We couple these performances of Mr. Chambers, as complete representations or pictures of perils by water: at least, such they appear to our lubberly apprehension. In each of them the artist has evidently been in his element, if we may judge from the skill with which both are executed.

161. *Distant View of Dover Castle.* P. De Wint.—Like all this able artist's works, distinguished by a broad masculine style of execution and a close imitation of nature, and accompanied, as in most other instances, by marked characters or objects in the foreground, which happily give value to the distance. In the present case, a timber-wagon, admirably foreshortened, is receding from the eye down a sloping road. This, and 257. *Water-Mill in Wensley Dale*, also by Mr. De Wint, are two varied and striking examples of excellence in landscape art.

77. *Castle and Town of Heidelberg from the Terrace.* W. Callow.—A very magnificent and imposing view of this celebrated city, to which the artist has given an equally grand and harmonious effect of light in sky and distance.

206. *Twilight*; 210. *Mountain Scene*; 215. *Landscape.* J. Varley.—These productions hanging in line we consider advantageous, as exhibiting the peculiar and classical style of the painter. They are nearly in one tone of colour, deep and rich; Rembrandt-like in their effect; and with almost as little of detail as we have seen in Cousin's blots: but still they are blots by an artist, and effect and design are sufficiently visible.

105. *Ferry Boat.* C. Bentley.—Judging from the stormy atmosphere and agitated water, we think this must be a dangerous trip; but it is spirited and picturesque in the highest degree.

The works of Mr. Prout, some fourteen or fifteen in number, form a prominent feature in this well-filled Exhibition. Views at Venice, on the Rhine, and in different parts of Germany, &c., are the subjects of his facile and vigorous pencil. The productions of Messrs. Glennie, Byrne, and Pyne, also add greatly to the pleasure and gratification afforded by the present Exhibition of the Society of Painters in Water-Colours; of which, with every good wish for their continued success and encouragement, we must now take leave.

#### THE DRAMA.

*Italian Opera.*—A new ballet of the *Fairy Lake*, on Thursday, is the only novelty at this theatre, and it is a very dull and heavy one. Madame Cerito dances well in it, and that is all.

*Haymarket.*—On Tuesday, a new version of a French piece, previously done at the Olympic, was produced here under the name of *Place Hunting*; which, notwithstanding the mercurial bustle of Wrench, and the clever acting of a *soubrette*, by Miss L. Horton, was not over and above successful. The situations do not

interest English feelings; and the humour, though occasionally laughable enough, is not sufficient to season the whole drama. In the *Irish Attorney*, Power mellow (literally in the drunken scene) every night; and the effects produced upon the risible muscles of the audience correspond with his exertions.

*German Opera.*—On Wednesday, a new opera by Conradin Kreutzer, called *A Night in Granada*, was produced here with great success. The music is harmonious and charming; the solos perhaps a little too long, but the choruses altogether splendid. By taking a verse off the former, the only improvement this beautiful composition needs will be accomplished. The drilling of the orchestra is perfect: the overture was deservedly encored, and a violin symphony and accompaniment to a chamber scene, of Herr Poeck (a Prince disguised as a Huntsman), are as fine as any thing we ever heard. The vocal execution of this performer is also of surpassing beauty. His organ is equally rich and flexible; and the ease with which he pours forth its treasures is quite delightful. Madame Schumann has a poor wiry voice, but with her graceful little person and musical talent got through her part very satisfactorily. The tenor deserves the commendation of being a pleasing singer, and his share in the concerted pieces added much to their effect. The whole opera affords a treat of no common order. Another operetta, called *Kosciusko*, was added; but it is sad trash, and ought never to be repeated. We were glad to notice that the box-office deprecation was reformed, and the parties attentive and civil.

#### VARIETIES.

*Royal Society of Literature.*—At the meeting on Thursday, Mr. L. H. Petit in the chair, a paper by Mr. O. Halliwell was read, 'On the Ancient Monastery of Ely.' It gave a remarkable account of the resistance of the Isle of Ely to the Conqueror for seven years after the battle of Hastings, and of William quartering forty of his warlike knights upon the monks, to keep them in order and submission. The knights and monks, it seemed, lived in excellent fellowship together, the former providing a protection to the latter. At length, when they were called away to act against William's rebellious son Robert in Normandy, the lamentations of their religious friends were loud and passionate. They accompanied them with hymns and ceremonies, denoting their affliction and their regret at the loss of such boon companions. These particulars are drawn from the introduction to a castulary of the monastery hitherto unpublished.—The next paper read was a continuation of Dr. Nolan's 'Essay on the Obelisks of Luxor and Carnac.' The first of which he considers to have been erected by Amnemes, the sister and successor of Amenophis, and the princess who rescued Moses; and the other at a subsequent period, by Mephris or Thothmes.

*Literary Fund Anniversary.*—The meeting on Wednesday was pretty well attended, including some popular literary characters. Sir R. Inglis filled the chair with ability, and was supported in the business of the day by Lord Fitzalan, Mr. Lockhart, Mr. Fraser Tytler, Sergeant Talfourd, and other gentlemen, who addressed the company. The essential result was very gratifying; above five hundred pounds was the announced subscription, independently of her majesty's annual bounty of a hundred guineas.

*Artists' Benevolent Fund.*—The anniversary,

on Saturday, was not so fully attended as we could have wished. Under the auspices of the noble chairman, the Marquess of Normanby, however, the company spent a pleasant evening, and a considerable subscription was collected.

*Berkshire Ashmolean Society.*—An antiquarian society has just been established at Reading for "The Publication of the Historical, Ecclesiastical, Genealogical, and Topographical Remains of the County of Berks," and consisting of subscribing members of one guinea annually. Mr. Richards, of Reading, is Secretary, and local secretaries have been chosen,—Mr. Bruce and Mr. J. G. Nichols, for London; Mr. Turnbull, for Edinburgh; Mr. Halliwell, for Cambridge; and Dr. Allnatt, for Wallingford. Nine works have already been suggested for publication.

#### LITERARY NOVELTIES.

In the Press.

Momentary Musings: Poems by K. D. Esq., the author (we believe) of a former vol. of poetry, entitled "Gonzalo and Alcega."

#### LIST OF NEW BOOKS.

Hippopathology, Vol. II. Part I.: The Diseases of the Horse, by W. Percivall, 8vo. 6s.—Historical Records of the British Army: The Second Dragoons, or Scots Greys, 8vo. 8s.—Morton's Veterinary Toxicological Chart, Case, 6s. on Rollers, 8s. 6d.—G. Boddington, on the Treatment and Cure of Pulmonary Consumption, fcap. 3s.—Religion and Crime, by J. M. Morgan, 2d edition, 8vo. 2s.—Treatise on the Christian Priesthood, by Hadrian Savaria, 18mo. 3s. 6d.—Bishop Bull's Vindication of the Church of England, 18mo. 3s. 6d.—Bishop Patrick's Help to Young Communicants, 18mo. 2s.—The Witch; or, a Picture of the Court of Rome, from the Spanish, fcap. 7s.—The Loss of the Tigris, a Poem, by H. Richardson, 8vo. 4s. 6d.—Cicero de Senectute, from the Text of Otto, with English Notes, 18mo. 2s. 6d.—The Poems of Schiller, Explained, by E. Bach, 12mo. 4s. 6d.—Chambers's Picture of Scotland, 4th edition, 12mo. 6s.—A Digest of Hooker's Ecclesiastical Polity, by the Rev. J. B. Smith, D.D. 12mo. 9s.—The Spanish Armada, A.D. 1588, by the Rev. T. Lathbury, fcap. 3s.—Plauti Menachmi, by J. Hildyard, 8vo. 7s. 6d.—Bede's Ecclesiastical History, translated by the Rev. J. A. Giles, 8vo. 8s.—The Anatomy of Suicide, by E. Winslow, 8vo. 14s.—Three Years' Residence in Canada, from 1837 to 1839, by T. R. Preston, 2 vols. post 8vo. 21s.—Examination of the Ancient Orthography of the Jews, by C. W. Wall, D.D. Vol. II. royal 8vo. 15s.—Life of T. M'Crie, D.D., by his Son, 8vo. 8s.—Memoirs of Mrs. Wilson of Bombay, 3d edition, post 8vo. 7s. 6d.—Hyacinth, and Lyrics, by Joseph Middleton, 12mo. 2s.—The Modern Art of Cookery, 18mo. 4s. 6d.—Cardinal Belarmino's Notes of the Church Refuted, 8vo. 7s. 6d.—Pool's Annotations on the Bible, Vol. I. Imperial 8vo. 25s.—The British Empire in the East, by Count Björnström, 8vo. 8s. 6d.—Description of British Guiana, by R. H. Schomburgk, 8vo. 5s.—Poems, Tales, and Essays, by S. C. Hooley, fcap. 4s.—Watson's General Telegraphic List of Ships' Names, 18mo. 3s. 6d.—Joan of Arc, a Play, by Mrs. J. A. Sargent, 8vo. 4s.—Christ and Antichrist, a Poem, by a Layman, 12mo. 7s. 6d.—Calvinism by Calvin, with Essay, by the Rev. R. Govett, jun., 18mo. 2s.—Sorrow and Consolation, by J. H. Grandpiere, 12mo. 5s.—Elijah the Tishbite, unabridged, royal 8vo. 4s.—Timon, but not of Athens, 2 vols. post 8vo. 21s.—Robertson's History of Scotland: Chambers's People's Edition, royal 8vo. 3s. 6d.—The Pulpit Help to Prayer, by the Rev. W. F. Radcliffe, 18mo. 3s.—The Book of Illustrations, or Scripture Truths exhibited by the Aid of Similes, by the Rev. H. G. Salter, 8vo. 10s. 6d.—The Widow's Offering; Essays, &c., by W. P. Scargill, 2d edition, 2 vols. post 8vo. 21s.—The Sacred Epistles Explained, by J. W. Dawe, fcap. 4s. 6d.

## GULLIVER'S TRAVELS, Complete in

1 large 8vo. vol.; illustrated with upwards of Four Hundred Wood Engravings by Grandville.

Handsome bound in cloth, lettered, price One Guinea.

Also, Part VIII. (completing the Work), price 2s. 6d.

Altogether this standard edition is worthy of its title."—*Spectator*.

"It is impossible to present to the public materials better calculated to strengthen their minds and set them thinking, and therefore we wish success to the publishers; and so far as that success may depend upon the merits of this edition, they are fairly entitled to it. The artist has seized the humour of the original with great spirit, and the notes throw a satisfactory light on the design of the author, and render the satire more intelligible to the modern reader."—*Athenaeum*.

"Altogether this standard edition of a standard author cannot be conceived."—*United Service Gazette*.

"The embellishments are very numerous, and their execution remarkably good; the spirit of the author being very happily conveyed by them."—*Morning Herald*.

"In the whole range of illustrated editions that have yet issued from the British press, there is not one that can compete with the one now before us, in the beauty and variety of its illustrations."—*Old England*.

"This work is in every way elegantly produced."—*Monthly Review*.

London: Hayward and Moore, Paternoster Row.

Next week will be published new editions of the

## LADIES' KNITTING and NETTING-

BOOK; being the Fifth of the First Series, and the

Second of the Second Series.

Present and Future Condition and Prospects of the Colony.

By ROBERT H. SCHOMBURGK, Esq.

Nimkin, Marshall, and Co. Stationers' Hall Court.

## A SECOND COURSE OF SERMONS for

the Year, containing Two for each Sunday, and one for

each Holiday, abridged from the most eminent Divines of the

Established Church, and adapted to the Service of the day; in-

tended for the Use of Families and Schools.

By the Rev. J. R. PITMAN, A.M.

"There is no question which the clergy are more frequently

asked, and in which they find it most difficult to give a satisfac-

tory reply, than this—What sermons would they recommend for

the use of a private family? We really think that Mr. Pitman's

work bids fair to supply the deficiency which has been so much

regretted."—*British Critic*.

A Third Edition, revised throughout, of the First Course, is just

published, same size and price as above.

London: Duncan and Malcolm, 37 Paternoster Row.

Edited by MAJOR SABINE, F.R.S.

In 1 thick 8vo. vol. with a Map, engraved from the original

Survey, by J. and W. Smith.

Prospectuses may be had of all Booksellers.

London: Longman, Orme, and Co.

## WALL ON THE ORTHOGRAPHY OF THE JEWS.

Royal 8vo. price 15s. cloth.

## THE PROPAGATION OF ALPHABETS,

and other Phonetic Systems throughout Eastern Asia;

and the vast Inferiority of Ideographic Writing, as displayed in

its effect on Human Learning. Being Part II. of an Examination

of the Ancient Orthography of the Jews, and of the Original

State of the Text of the Hebrew Bible.

By CHARLES WILLIAM WALL, D.D.

Senior Fellow of Trinity College, and Professor of Hebrew in

the University of Dublin.

Also to be had, uniform in size and price, Part I.

## An Inquiry into the Origin of Alphabetic

Writing; with which is incorporated an Essay on the Egyptian

Hieroglyphs.

London: Whittaker and Co.; Dublin: Milliken and Son.

"And where the gardener, Robin, day by day

Drew me to school along the public way,

Delighted with my bauble coach, and wrapp'd

In scarlet mantle warm, and velvet cap."—*Cowper*.

## CHILDREN and INVALIDS.—Of high

value in the Preservation or Restoration of Health.—

Children's Carriages, of a superior, light, elegant, and compact

make, and so perfectly secure and easy, that Children may be

travelling with impunity in the most careless hands. Invalids'

Wheel Chairs of all sorts; also, Self-moving ones for house and

garden, on sale or hire,—at Ingram's Furniture Warehouse, No.

29 City Road.

## CONSIDERATIONS ON THE STATE OF

THE LAW regarding MARRIAGES with a DECEASED

WIFE'S SISTER.

By a BARRISTER OF THE MIDDLE TEMPLE.

London: Longman, Orme, and Co.

Marriage Act, 5th and 6th William IV. c. 54; commonly

called Lord Ebury's Act.—Partly approved by the above

Act, which prohibits Marriages with a Deceased Wife's Sister,

are earnestly solicited to co-operate in an endeavour, now mak-

ing, to obtain its repeal. The prohibition has no foundation

either in Religion or Morality, and cannot be supported upon

any ground of rational expediency.

Communications to be addressed to A. B. care of Messrs. Wil-

son and Ogilvy, Printers, 57 Skinner Street, Snowhill.—Names

will be scrupulously concealed, if desired.

In 8vo. price 10s. 6d. boards.

DISSERTATIONS ON SOME PARTS OF

THE OLD AND NEW TESTAMENTS, which have been

supposed unsuitable to the Divine Attributes.

By RICHARD TROPEY, M.A.

Rector of Casterton Parva, Rutland; and formerly Fellow of

Oriel College, Oxford.

Rivingtons, St. Paul's Churchyard, and Waterloo Place.

\* \* \* The following are among the subjects treated of in this

volume (published in 1838).—Passages of Scripture which seem

to represent the Almighty as the cause of evil.—Passages of Scrip-

ture which seem to represent the Almighty as approving evil

(imprecations in the Psalms; alleged indecencies of the Bible).—

## FRENCH GRAMMAR FOR PRIVATE TUITION.

In 8vo. price 12s. in cloth, the 7th edition of  
**A GUIDE to the FRENCH LANGUAGE,**  
 especially devised for Persons who wish to study the  
 Elements of that Language without the assistance of a Teacher.  
 By J. F. L. BRETHON.  
 London: Baldwin and Cradock, 47 Paternoster Row.

Also, price 8s.

**A Key to the Exercises in the above Work,**  
 by means of which any person of a mature understanding may  
 acquire the elements of the French Language practically, as surely  
 as if a professed teacher were sitting by his side; and, with a very  
 superficial knowledge of it, may teach it to others. Directions  
 are given in the Key to Parents not accustomed to teach lan-  
 guages, who wish to instruct their Children with the assistance  
 of this book, how they must proceed.

Works recently published and in preparation, by  
 Mr. Van Voorst.

"I am (NOT) forbid  
To tell the secrets of the prison-house."

3 vols. post 8vo. with Illustrations.

**NEW WORKS JUST PUBLISHED:—**

I.  
**THREE YEARS' RESIDENCE IN CANADA,**

1837-1839, with Notes of a Winter Voyage to New York, and Journey thence to the British Possessions; to which is added, a Review of the Social, Commercial, and Political Condition of the Canadian People.

By T. R. PRESTON, late of the Government Service at Toronto. 2 vols. post 8vo.

II.  
NARRATIVE OF A  
**WHALING VOYAGE ROUND THE  
GLOBE,**

During the Years 1833, 1834, 1835, and 1836.  
By F. DEBELL BENNETT, Esq. F.R.S. &c.

"A work alike useful and agreeable. Mr. Bennett's education and studies have given him more extended views than the generality of visitants to distant places possess. Land where he would, he had various objects of remark, in earth, air, ocean, plants, animals, and man; and he brought to their observation a trained ability. The work presents a very succinct account of the habits of the sperm whale, as well as of the manner of conducting the fishery, and the history and statistics of the trade."—*Spectator*.

III.  
**LYRA URBANICA.**

In 2 vols. post 8vo. with Portrait of Captain Morris.  
THE SOCIAL EFFUSIONS OF THE CELEBRATED  
CAPTAIN CHARLES MORRIS,  
Of the late Life Guards, Member of the Beef-Steak Club, &c.

"The reputation of Captain Morris's lively humourous muse renders criticism superfluous. His songs are known wherever English songs are sung. Every man-of-war in the army, every genial board, every jovial company, is familiar with these flowing, merry, half-sentimental, half-roistering, lyrics."—*Atlas*.

IV.  
**THE FIRST THREE VOLUMES OF THE COMPLETE EDITION OF  
HORACE WALPOLE'S LETTERS**

Are now ready, price 14s. each, bound, embellished with Portraits (engraved by Greatbach, from the original Paintings at Strawberry Hill, &c.) of  
Sir Robert Walpole | George Montagu | Lady Suffolk  
Lady Walpole | Lady Townshend | Sir Horace Mann  
Gray (the Poet) | Duke of Argyll | Richard Bentley (the  
Duchess of Queensberry | Kitty Clive | Virtuoso)  
George Selwyn | Hon. Rich. Edgcumbe | J. Chute  
Gilly Williams.

"This Edition will be comprised in Six Volumes.  
"Walpole's letters are unequalled in the language; delightful in themselves, and a most amusing and instructive commentary on the history of parties and of the country, from 1735 to 1797. This edition is to contain not only all that have been published, but several hundred letters which have hitherto existed only in manuscript, or made their appearance singly and incidentally in other works; the whole arranged in chronological order. We look forward with pleasure to the publication of the remaining volumes, and have no doubt we shall glean from them a rich harvest."—*Athenaeum*.

**RICHARD BENTLEY, NEW BURLINGTON STREET,**

Publisher in Ordinary to Her Majesty.

V.  
**THE MAID'S HUSBAND; A NOVEL.**

3 vols.

"The title of this novel is both singular and attractive, but the contents are still more so. To shew that the career of single life may be pursued with honour and dignity by woman, is the purpose of 'The Maid's Husband.' The novel is lively, witty, full of contrast, replete with incident, and throughout there is a combination of good feeling and sound principle."—*Morning Herald*.

VI.  
**ELEVEN YEARS IN CEYLON.**

By Major FORBES, 78th Highlanders.

2 vols. 8vo. with Illustrations.

"Major Forbes is just the writer from whom the public would most willingly receive an account of Ceylon. He has all the frankness of a soldier, mingled with the taste and judgment of a scholar. Whether he recites the annals of ancient wars, describes the relics of former grandeur, exhibits the proofs of present improvement, or leads us into the forest jungles to enjoy the exciting chase of the wild elephant, we find him equally full of information. This is high praise, but it may easily be justified by reference to the work."—*Athenaeum*.

VII.  
**THE STANDARD NOVELS AND  
ROMANCES.**

The following popular Works of Fiction have recently been included in this Series:—

Mrs. S. C. Hall's <i>Buccaneer</i> , 1 vol. 6s.	Mr. Lover's <i>Rory O'More</i> , 1 vol. 6s.
Mr. Hook's <i>Jack Brag</i> , Maxwell, the	Mrs. Edgeworth's <i>Helen</i> , 1 vol. 6s.
Parson's Daughter, each in 1 vol. 6s.	Mr. Hope's <i>Anastasia</i> , 2 vols. 12s.
Mrs. Trollope's <i>Vicar of Wrexhill</i> , 1 vol. 6s.	Mr. Morier's <i>Zohrab</i> , <i>Hajji Baba</i> , <i>Hajji Baba in England</i> , each in 1 vol. 6s.
Captain Chamier's <i>Ben Brace</i> , 1 vol. 6s.	Captain Marryat's <i>Popular Novels</i> , each in 1 vol. 6s.
Sir E. L. Bulwer's <i>Last Days of Pompeii</i> , Paul Clifford, Eugene Aram, each in 1 vol. 6s.	Mr. Cooper's <i>Pilot</i> , <i>Spy</i> , <i>Last of the Mohicans</i> , <i>Prairie</i> , <i>Pioneers</i> , <i>Borderers</i> , <i>Lionel Lincoln</i> , <i>Water Witch</i> , <i>Bravo</i> , <i>Red Rover</i> , the <i>Headman</i> , the <i>Heidenmauer</i> , <i>Precan</i> , each in 1 vol. 6s.
Mr. James's <i>De L'Orme</i> , <i>Darnley</i> , <i>Philip Augustus</i> , <i>Henry Masterton</i> , each in 1 vol. 6s.

## REVIEWS OF NEW BOOKS.

*The Sportsman in Ireland, with his Summer Route through the Highlands of Scotland.* By a Cosmopolite. 2 vols. 8vo. London, 1840. Colburn.

WHY a Cosmopolite, we do not know; but as a brother of the gentle craft (unless the use of gentles were the origin of the title instead of the elegant and subtle art of fly-fishing) we fancy the members of the Walton Club, and all true anglers, will be ready to disown our author. His fishing is pot-walloping, and his means nefarious. Only think, instead of the exquisitely thrown line within an inch of the mark, and so softly that the smoothest surface of the water hardly tells of its fall, that there is a clumsy bait, sunk by a massive bullet into the boiling caldron of the cataract or stream, and till the trout or salmon lugs your tackle away, you do not know whether you are actually angling or plunging about for nothing. Protesting, therefore, against our Cosmopolite taking a place in the rank of true sportsmen, we must treat him as a tourist who saw a good deal of the country, and has described what he saw in an amusing manner. His book might have been shortened with advantage; but publishing, like his fishing, looks beyond the sport to the substance of what may be caught. Some of our readers will, we are certain, be desirous to know as soon as possible what the marvellous process was by which the author enticed, nay, as it were, compelled the scaly brood to quit their native element to entertain him with their convulsive throes upon the sod, and succulent nutrition upon the platter. List then, O anglers! to the story of two salmon captured by their enemy:—

“Although the season was getting late, and the salmon would be considered no longer the lawful spoil to the fair sportsman, I confess I prized them greatly, not for any inviting qualities they possessed for the table, but for the inestimable spawn they contained. On my arrival at a small hut, I halted with my attendant, and, having taken both the roes from the fish, I proceeded thus to cure them. The full roes were placed in a large basin of water. The particles were carefully separated, and the blood thoroughly washed from them. Having, after the cleansing, carefully drained the roe through a cloth, I put about two pounds of common salt upon them, working the salt well in by the hand. I then tied the whole in a cloth, and suspended it in the air while the preparations for my refreshment were making. In two hours I tied the mass up in a handkerchief, and placed it in my basket. The next day I potted it carefully down. This proved, on the ensuing season, some of the finest roe-bait I have ever possessed. My motive for giving this receipt here is, that whenever any of my fraternity may become equally fortunate in the capture of the fish in this state, they will be enabled at once to convert that, which is generally considered valueless, to the source of future success.”

Having let out this grand secret of the salted salmon roe bait (long used in the north, by the by, when the rivers are thick and *drumly* from rains and tempests), we revert to the beginning

of our task. There is a dedication to a distinguished general, who once, unconsciously, tasted a specimen of our sporting, such as the Cosmopolite never saw at table; and which, though certainly not relished by the gallant soldier, we may mention in the way of gastronomy as being rather delicate in a *fricassée*. Did any of our friends ever eat of hedgehog? Without his prickles he is not so bad! *Verbum Ed.*

It seems as if nobody could not go nowhere in Ireland upon no kind of pursuit whatsoever, without getting into politics. Accordingly, our author, leaving its beautiful lakes and crystal streams, tumbles into the bog, and lands O'Connell, disparages Wellington (pages 310-11, Vol. I.) praises the priests, and dispraises lords and marquesses, is pathetic on Hibernian poverty, and talks wildly of wild torrents, wild feelings, wild passions, wild freedom, wild love of justice, and other wildnesses more easily expressed than comprehended. Of the pathos, we select an example from the embarkation at Bristol:—

“See that father and mother, with their helpless race of children; behold them shivering in the bleak March blast, and now and then submitting to the spray which dashes over their half-covered limbs! That child, squalid and bare, crouching beneath the mother's scanty rags, behold her! She is human—those blue eyes seem to speak intelligence; she looks wistfully, beseechingly, yet modestly. It is for food she asks. Inquire their little history; it is the history of all. That father is strong, active, and not deficient in intelligence. You see he does not want feeling for those dependent on him; he has covered the children with his grey frieze coat, and bears the falling rain with a manly defiance. Unable to discharge the heavy imposts of his landlord and the tithe, he has been expatriated; he has sought what he imagined was the golden land; he has sought the English coast. Prejudice and the poor-laws have been his unconquerable foes. Employment was nowhere to be found; and, after a year's travelling from place to place, during which the hedge and the sheep-hovel have been his only covering, and the covering of his wife and little ones, he has at length been found guilty of being destitute, and condemned to—his native country. The surly officer, whom you saw speaking to him at Bristol, was employed to ship him and his family safely off by the packet. Their sea-store was supplied, their passage was paid. The bundle, which the enduring woman has hanging from her arm, contains potatoes; they have been already cooked, and you will see the father frequently distributing a portion among his trembling children—God help them! But their native land is now in sight. A joyous exclamation is heard among some—it is among the cabin passengers. Each runs to gain a glimpse of land—of Ireland—the place of our destination. All are pleased, except only the miserable family whose patient endurance of the long sea passage, whose hunger the lowest of human food has barely appeased;—from them, and those who surround them, no sound of delight is heard. The countenance of the oppressed

father, as he shiveringly looks down upon his children, is marked by a stern misery;—his native land is indifferent to his view; it almost excites horror. For him, alas! and his, no home is there prepared;—he has no spot whereon to lie! no store, from which the wants of his little ones shall be supplied! To him, his native shores present only the barren rocks of desolation and despair. This is strange, and its cause is worth inquiry; for a cause there must be, why the child of a free country, able and willing to labour—asking only the meaneast reward for his toil and zealous exertions—stained by no crime—should look to that free country, and demand but bread, yet be refused. There is a cause, a deep and damning one—‘if philosophy could find it out.’ The morning broke; and who that has voyaged by steam or coach does not shrink at the remembrance of the peeping morn of March? The face of the ocean presents a cold cheerlessness, which even the sluggish sunrise does not dispel; its rays seem rather to render still more visible the ravages of watchfulness or inebriety. Every face is without a smile; the features are paralysed; even the mind is benumbed and depressed, and misery looks still more miserable. The lower deck of the steamer was the parade of those who had known no other couch during the night. The wretched family I had before observed were still crouching under the packages; the father standing, in silent suffering, over them!”

Whatever of real truth may be in this picture is no doubt to be deplored; but there are other and very different views “if Philosophy could find them out.” A sudden mountain storm, of which we have an account, shews that Nature can be as violent and severe as man:—

“In the year 1832, the month of June was singularly dry. The 15th of that month put forth the appearance of a brilliant day;—the sun shone out in unalloyed splendour, and diffused heat and life around. On the banks of the Clyde might be observed the rustic dwellings of numerous humble families, and in the midst of them the mansion of a gentleman who had devoted himself to the exercise of that hospitality which is almost the distinguishing characteristic of the Irish; at least, of those who are unpolluted by the extravagance of a residence in England. On the morning of the day above-mentioned, he was surrounded by his family; the cottagers were enjoying the loveliness of the day; the cattle every where grazing on the abundant verdure which covered the slopes towards the river. Suddenly the sun became obscured—the roar of distant thunder shook the dwelling—fear started into every countenance—and, before any had time to communicate with another, a terrific cataract rushed from the mountains, sweeping all before it—bridges, cattle, houses, and their unlucky inhabitants, all hurled to an instant destruction. Such was the fury of the flood, that rocks of fifty tons weight were thrown from the bed of the river into the adjoining fields—the habitations of the poor retained no vestige of their existence—bridges, built on granite, at once disappeared, and the power of the flood reigned supreme.

In one hour all was again still. The river assumed its usual form, trickling among the rocks, and here and there forming a slight bay. The sun shone forth with his accustomed splendour; but the inhabitants, whose smiling dwellings had before given a charm to the scene, were no more heard! Every human creature, whose habitation was on the banks of the Clyde, suddenly perished, without warning, and without apparent cause."

Some of the author's aquatic exploits on the coasts of Ireland are painted in rather a Major Longbow vein; but they are diverting even from their apparent exaggeration. After performing them he left that country for Scotland, parts of the Western Highlands of which he traversed, which hardly bears out the extended phraseology of his title-page, "through the Highlands of Scotland." What he did see seems not to have impressed him favourably with the Scotch character. He accuses the innkeepers, and nearly all other classes with whom he had any dealings, with being extortioners of the rankest kind:—

"It has been," he says, "decided by her majesty's Court of Queen's Bench that, to say of an inn, 'he who stays there must have a long purse,' is no libel. I may, therefore,—as I really wish to afford useful information to my successors in the tour of the Highlands—duly premise that an ample supply of coin is the first requisite; as the Clarendon is tolerably modest, when compared not only with the inns of Inverary, but all that have been erected into such on the line called the popular tour. Time was that one could travel through the Highlands and enjoy the lowly accommodation which the modest halting-houses presented, and escape with a charge in a degree commensurate with the accommodation afforded. Now, indeed, every such hostelry has been metamorphosed into an inn of pretence; with a gentleman waiter, duly ensconced in a black suit, to lay before you dirty tablecloths, steel forks, and execrable stuff, dignified by the appellation of dinner. This is performed, too, with the conscious air of one bestowing a benefit; while the landlord awaits to receive your thanks for the kind interest he has taken in your welfare—in permitting you to be housed at all. The truth is, that the inns on the highland tour, which have been very recently erected, and let at enormous rents, are now the only places where a resting-place may be found. All who travel must stop at them; and, though it frequently happens, that parties of ladies are compelled to sleep in what is called the coffee-room, and on chairs, and sometimes even in their own carriages, the influx of tourists is still so great that the stranger is at the mercy of the landlord, who would by no means tolerate any remonstrance as to the unreasonableness of the charges. The enormous rents demanded by the landed proprietors, whose houses these all are, contribute greatly to keep up and encourage the system of extortion which will be universally complained of in a Scottish tour; there is no remedy for this, but to avoid the place. And why should it be sought, when the search brings one among persons whose only object is fleeing—whose only welcome is bought at a price of so unequal amount; while the splendid highlands of Ireland, whose inhabitants would flock to serve the stranger, and where moderation in all demands will be found, are still neglected or unknown? The gorgeous equipages which I have beheld dashing up the mountains from Inverary, burdened with the wealthiest of the wealthy sons of England, whose lavish expense enriches only the grasping

landlord, but scatters no genial good to the poor, would, had their course been directed up the still more magnificent mountains of Kerry, Connemara, or Clare, have been the means of saving many a starving family, whose real distresses and privations remain unknown to the rest of the world. I have, however, now to speak of Scotland. It is not the country for a sportsman. The landlords here, indeed, are too cannie to permit it; and it has long lived on a reputation that, I trust, every year will contribute to dissipate. I found at the inn Lord F—, Captain D—, of the Guards, and Captain F—, all good sportsmen and true. They had, however, just returned from where they had been induced, by the representations of the steward, to purchase the shooting over a considerable estate. Their expressions of disgust at the paltry imposition practised on them need not be repeated. The sum was one hundred pounds; the terms of invitation contained also assurances that the red deer were abundant. Not one found they; as, I believe, they had disappeared from the estate in question about the same time that the elk took his leave. A few, and very few, grouse rewarded a fortnight's toil, and reimbursed them for their one hundred pounds. But they had the pleasure of residing, during their short sojourn, at a small inn belonging to the same proprietor, whose landlord had not forgotten that they were persons capable of paying well for mountain mutton, since they had so liberally disbursed for a few grouse. I believe nearly every estate that can bear a long advertisement is now let in this way for the season, and the continued succession of hirers is really marvellous. On one half of the estates thus let there is not, and in the memory of man never was, any game. Yet, in the Highlands of Scotland, to be seen with a gun is an offence against the aristocracy, which they will by no means pardon. In no country in the world—not even the civilised tracts of England—is game more strictly preserved than here; and it is well to preserve it, if it be not desired that it should become altogether extinct. But the strict guard is not appointed for the generous purpose, as in other countries, of affording sport to the friends of the proprietor; true to the national character, it is looked on only as a source of gain, and a mode of boozing the wealthy English out of their money. In one instance, so gross was the imposition, and so utterly void of truth was the representation of the existence of game, that the deluded gentleman, who had absolutely paid two hundred pounds for the season's shooting, very properly called the proprietor to account, and distinctly told him that he should consider him answerable for the deception under which he suffered. The answer he received was of a character befitting the transaction;—a part of the money was returned, but with an assurance from the lord of the soil that the deputation of the manor was always placed in his steward's hands, and never directly or remotely interfered in by himself; and it could, as he observed, be hardly reasonable that the proprietor should be answerable for the acts of the steward. The delicate ignorance of the acts of the deputy, although the proceeds had doubtless found their way into the pocket of the master without inquiry, was very admirable, and excused the latter from any very personal responsibility."

How unjust a general charge such as this is we need not say. A very few instances of discontented tourists being charged more than their stingy natures relished for their accommodation at inns, and of pseudo-sportsmen disappointed

in the extent of their slaughter on the heath-covered hills, are but poor grounds on which to libel a nation eminent for its hospitality. The author did not deserve to enjoy the princely entertainment so liberally accorded by the nobility of Scotland to the numbers whom they honour as their guests; nor the more lowly, but no less warm and kindly welcome of the humbler ranks. He was a grumbler, whom no native of any country likes; and, having tasted the fruits of that disposition, he now turns round to abuse and vilify whole classes for the treatment he so worthily earned at the hands of the few with whom he came into contact. His story of a farmer's wife making him a present of a turkey, and pillaging him of eight shillings for it, we will venture to say is not the truth; and, having thus insulted his voracity, and vindicated the Land of Cakes from his aspersions, we gladly yield him and his potted salmon-roe to another Irish excursion, sincerely hoping that he will never visit Scotland again, or, if he does, take care not to make himself known there as the writer of these volumes.

*Historical Reveries.* By a Suffolk Villager. Small 8vo. pp. 117. 1839. London: Longman and Co. Sudbury: Fulcher.

THIS is a beautiful and unassuming little volume; plain in its outward attire; in a few brief words of preface; and in two or three sweet, simple verses, dedicated by the authoress to her mother. We say *her*, for it bears internal evidence of being the production of a lady. The perusal of it has afforded us much pleasure,—has refreshed our mind, by bringing us back from the mere empty jingling of rhyme to the true and natural, which alone constitute healthy poetry. True, the work is not without its faults; but even these are never of a kind to offend; for many of the errors seem to have a *naïveté* and a charm, and to strike us more strongly with the originality of the subjects. The thoughts have evidently emanated from the heart; the writer has felt what she has written; and accordingly, in return, makes us feel what we read,—one of the greatest and best tests of the goodness of poetry; and we forget her little errors, verbal or metrical, while drinking in the refreshing thoughts. Her faults are, however, such as practice will remove: would that we could say the same to all aspirants for the poetic wreath! The following extract will justify our remarks; it contains many faulty lines, but also many beautiful ones; while the feeling throughout the poem is excellent, and appeals directly to the heart: we wish it had been written in another measure:—

"Retrospection.

We skirted the green common in evening's quiet light,  
We swept along the broad road an hour before night,  
We left behind long avenues of deep and massive green,  
And nearer, nearer, nearer still the city vast was seen.

Its dim and distant spires more clearly defined grew,  
Its giant domes rose silently the misty ether through;  
And closing in around us stretch'd its lengthening shadows  
dun.

When a narrow lane-way open'd towards the setting sun.

I know not what it is, in a summer afternoon,  
In the calm of still July, or the green delight of June;  
I know not what it is, but I know the feeling well,  
Comes over me at sunset like a vision or a spell.

I know not what there should be of influence or of  
power;

In the fall of the day more than any other hour;  
But oh! I know it well, like a gleam of something gone,  
How strangely it comes o'er me as the sunset-light comes  
on.

We pass'd a narrow lane that came up from the west,  
We were sweeping through the broad road by busy feet  
impress;  
And the yellow slanting sunbeams, with an almost level  
ray,  
Stream'd down upon a boy who was running there at  
[play.]

Running, running, all alone, in an ever-changing ring,  
Round some wooden plaything which he held in a long  
string.  
And whir'd it round and round him, and ran round it  
eagerly,—  
It might be boat, or sledge, or kite, he meant that it  
should be.

Not that it was like these things, or any thing defined,  
But form and colouring live within a child's inventive  
mind;

And, unlike the hurrying passers-by, he ran round there  
at play,  
As if upon some village-green a hundred miles away.

I know not what it is, but a sad and strange delight  
Unconsciously came o'er me as I look'd upon the sight;  
And amid the quiet streets, through the long and  
thoughtful day,  
I am haunted ever since by that happy child at play.

It is even such a feeling as rises in one's breast  
At the sight of pleasant pictures, of gardens trimly drest,  
With their long, smooth, gravel walks, and their never-  
turning ways,  
Seen as they used to look in the hue of other days.

Or when one turns the pages of some great gardener old,  
Who lauds the tall sunflower and gleaming marigold;  
The spires of the hollyhock, and the scented hawthorn  
bough,  
And all those grave and stately things which are thought  
nothing now.

I am tired of the bright shows that meet me every where,  
I am tired of the hurry, I am tired of the glare;  
I wish I were again in that world of long ago,  
It seems as if I'd lived in, though when I do not know.

There are some rude old verses, about the hills of Wales,  
And a cottage buried far in the winding inland dales,  
And a grey-hair'd old woman with a quick and cheerful  
air,

And I never read those lines but I half seem to have been  
It may be a half memory of the chalky uplands wild,  
Where we play'd and gather'd wild flowers when I was  
quite a child;

And the ancient lady living where the brook ran past her  
door,

With her garden of anemones, and her neatly sanded  
Of the long shady lanes where the thick hazels grow,  
And the lone deserted lime-kilns where the wild roses  
blow,

Where thy sweet lily, Nettlestead, in other days held  
state,

And the gateway of her home stands to mind us of her  
Oh! they are gone, those changeeful times, of reckless  
pastime all,  
Save when the hasty brand was drawn, the sudden axe  
let fall;

When he who once was glad to hide in green Boscobel's  
shade,

At merry bowls in Christ-church park beneath the chest-  
nuts play'd.

When Monmouth rode, a hunter blythe, the gay knight  
of the rose,  
And Claydon's hills and rich corn-fields saw proud and  
gallant shows,

Too soon to see, like summer skies, all shapes of change  
flit by,

While he, the lily's twice false lord, was led in shame to  
Ah, well-a-day! we will not grieve for troubled years like  
these,

Nor wander from our argument to haunt those green old  
It is but through one human life our glance is stretching  
back,

And dim enough in distance lies its sunrise-gilded track.  
We were speaking, we were thinking, of the fitful gleams  
that come,

Like sudden torches lifted in a dark and starry dome,  
Where the tools of the astrologer lie scatter'd on the  
ground,

And cast may be our horoscope, and life's lost entries  
found.

It may be some faint traces of villages far hence,  
Where the broad Trent rolls his stream by the pasture-  
land's green fence;

Where by the side of Tuxford heath winding our pathway  
lone,  
With awe I used to look upon the grey rebb't's stone.

O! memory-hallow'd Ossington! sweet bower of ro-  
mance,  
Whence life, afar-off look'd on, wore a pleasant counte-  
nance;

I have not found its aspect upon a nearer view  
Like the thing it seem'd to be when in thy horizon  
blue.

In the woodpaths long and lonesome, oh! for an hour of  
play,  
Or down in the pond-garden beneath the poplars grey,  
Where we rock'd upon the willow-bough above the hill of  
moss,

With the gardener's ruin'd cottage seen the broken hedge  
across.

Oh! for an hour of hunting in the study's dusty screen,  
For a rare and untold story of what had never been;  
A gaze on the old paintings that hung the dark walls  
round,  
And led the wandering spirit o'er magic-tinted ground.

Oh! where, where, can the world be, to which memory  
pointeth back,  
I know not where to find it in life's well-beaten track:  
I have studied grave geography, and pored on map and  
chart,  
But I never found the pleasant land whose face is in my  
heart.

Oh! the present time forgets what the future was to give,  
And the further-off seems happiness the longer that we  
live;

We see it far before us, fast fleeting as the wind,  
And turning to look backward, we see it far behind.

They say, the quiet eventime of life's declining day  
Doth wear a better hue than its morning's glad array;  
I wonder if its sunset will ever bring to me  
As sweet a light as that which doth linger over thee.

Farewell, farewell, green Ossington! would mine were  
but the rhyme,

'Could give thy pleasant name in sure keeping unto Time!  
Like to some gone-by masque array'd beneath the sum-  
mer bough,

Like a dream but half returning, for ever comest thou."

*Peter Paul Rubens, his Life and Genius.*

Translated from the German of Dr. Waagen,  
by Robert R. Noel, Esq. Edited by Mrs.  
Jameson. 8vo. pp. 132. London, 1840.  
Saunders and Otley.

WE entirely agree with the fair editor. To  
constitute a great artist,—indeed, to constitute  
a great man of any kind,—the concurrence  
of genius and industry is indispensable; for,  
without a fine natural organisation, the most  
dogged labour will be unavailing; and the  
finest natural organisation, without unremit-  
ting labour, will be equally so. The attain-  
ment of celebrity requires a third ingredient—  
opportunity. Perhaps no human being ever  
lived who combined these and other advantages  
more extensively than Rubens. Nevertheless,  
the mind is still overwhelmed with astonish-  
ment on contemplating the number and excel-  
lence of his works, and the wide diffusion of  
his fame.

"With regard to Rubens," says Mrs. Jame-  
son, "there may exist a difference of taste, but  
there cannot, I conceive, be two opinions. The  
degree of pleasure we take in his works may  
depend more or less on our sympathy with, and  
comprehension of, the man, as a man: but,  
assuredly, every cultivated judgment, formed  
on just principles of art, must, consistently with  
such principles, pronounce Rubens one of the  
greatest painters in the world. We could en-  
tertain no very exalted idea of the taste of one  
who could prefer Rubens to Raffaele; but we  
should feel inclined to compassionate those who  
could not understand and appreciate Rubens.  
Pleasure, and pleasure of a most vivid kind, is  
necessarily shut out from such a mind. To  
venture to judge Rubens, we ought to have  
seen many of his pictures. His defects may be  
acknowledged once for all; they are, in all  
senses, gross, open, palpable. His florid colour,  
dazzling and garish in its indiscriminate excess;  
his exaggerated, redundant forms; his coarse  
allegories; his historical improprieties; his vul-  
gar and prosaic versions of the loftiest and most  
delicate creations of poetry;—let all these be  
granted: but this man painted that sublime  
History, almost faultless in conception and in  
costume, the 'Decius' in the Lichtenstein Gal-  
lery. This man, who has been called unpoet-  
ical, and who was a born poet, if ever there  
was one, conceived that magnificent epic, 'The  
Battle of the Amazons'; that divine lyric, 'The  
Virgin Mary trampling down Sin and the  
Dragon,' in the Munich Gallery, which might  
be styled a Pindaric Ode in honour of the  
Virgin, only painted instead of sung; and those  
tenderest moral poems, the 'St. Theresa plead-  
ing for the Souls in Purgatory'; and the little  
sketch of 'War,' in the Lichtenstein Gallery,  
where a woman sits desolate on the black, wide  
heath, with dead bodies and implements of war

heaped in shadowy masses around her; while,  
just seen against the lurid streak of light left  
by the setting sun, the battle rages in the far  
distance. In both these pictures, the moral  
and the sentiment are so exquisitely pure and  
true, and conveyed to the mind and to the  
heart with such comprehensive and immediate  
effect, that they might be compared to some of  
the sonnets of Filicaja. Look but at the thir-  
teen hundred pictures, all the product of his  
own vehement and abounding fancy; in great  
part the work of his own right hand. In these  
multifarious creations, embracing almost every  
aspect of life and nature, what amazing versa-  
tility of power as displayed in the conception of  
his subjects,—what fertility of invention in  
their various treatment! What ardent, breath-  
ing, blooming life,—what pomp and potency of  
colour and light, have been poured forth on his  
cannass! If he painted heavy forms, has he  
not given them souls, and animated them with  
all his own exuberance of vitality and volition?  
Whatever his personages enact, they do with  
all the earnestness of the soul which conceived,  
and all the energy of the hand which formed  
them. Dr. Waagen dwells on the dramatic  
power of Rubens as the first and grand charac-  
teristic of his genius; and who ever excelled  
him in telling a story?—in connecting, by sym-  
pathetic action or passion, his most complicate  
groups, and with them, in spirit, the fascinated  
spectator? And though thus dramatic in the  
strongest sense, yet he is so without approach-  
ing the verge of what we call theatrical. With  
all his flaunting luxuriance of colour, and occa-  
sional exaggeration in form, we cannot apply  
that word to him. Le Brun is theatrical: Rubens  
never. His sins are those of excess of  
power and daring; but he is ever the reverse  
of the flimsy, the artificial, or the superficial.  
His gay magnificence and sumptuous fancy are  
always accompanied by a certain impress and  
assurance of power and grandeur, which often  
reaches the sublime, even where it stops short  
of the ideal."

Again:—

"Distinct as Rubens and Titian appear in  
their works, they seem to me to have been  
kindred minds, the very contrast which they  
exhibit as artists arising, in a manner, out of  
certain organic affinities in the nature of the  
two men; they saw with the same eyes, only  
that which they saw was different—as different  
as Flanders and Venice. 'Both were painters  
of flesh and blood; by nature poets, by confor-  
mation colourists; by temperament and educa-  
tion, magnificent spirits, scholars and gentle-  
men, lovers of pleasure and of fame.' The  
difference between the glow of Rubens and the  
glow of Titian is the difference between the  
bright northern and the fervid southern cli-  
mate; between the dewy, roseate, all-involv-  
ing light of morning, and the soft, shadowy,  
mellow splendours of evening. Let us endea-  
vour to contrast in our fancy, or rather our  
memory, certain of their pictures; for in-  
stance, the 'Helena Formann' of Rubens, with  
Titian's 'La Manto,' in the Pitti Palace; the  
'Man with the Hawk,' of Rubens, and Titian's  
'Falconer'; the 'Chapeau de Paille,' and the  
'Flora' of the Florentine Gallery; can any thing  
in art or creation be more opposed? and yet,  
in all alike, is it not the intense feeling of life  
and individual nature which charms and fixes  
us? But the characteristic in which Rubens  
did indeed surpass Titian, and every other  
painter in the world, except Raffaele and  
Albert Durer, was fertility of ideas. They  
seem to have gushed forth on his canvass like  
a torrent, overpowering his judgment, confused

by their own superabundance. It is only by understanding this *superflu d'âme et de vie*, that we can account for certain anomalies in his works. That he was a learned classical scholar, yet committed the wildest anachronisms in manners and costume—that he was familiar with the grace and grandeur of the antique, and could feel and understand both, yet was guilty of the strangest solecisms in character and form—arose not from incapacity or from ignorance, but from the influence of a foregone period in art, from which he could not shake himself wholly free, Titan as he was; and yet more from certain strong elements of his physical nature, beyond the mastery of his intellect, strong as *that* was. Rubens understood himself, knew what it lay in him to do, and did it confidently, joyously, spontaneously; and therefore it is, that with all his faults he remains ever great, original, and consistent with himself."

This is as true, as it is spiritedly and beautifully expressed.

Dr. Waagen's Essay is divided into two parts. The first consists of a sketch of the life of Rubens, comprehending a full development of his personal qualities and character; the second consists of a critical examination of his principal pictures, shewing the irresistible influence which his personal qualities and character had exercised in their conception and execution. Both parts deserve the deepest attention. The life is pleasingly narrated, and forms an admirable introduction to the estimate of Rubens as a painter: but we think that we shall best consult the advantage of our readers, and, at the same time, best exhibit the merits of the treatise, by quoting from the latter portion of it a masterly passage, illustrative of the condition of painting in the Netherlands at the period when Rubens commenced his career.

"The great school of the brothers Van Eyck, which united with a profound and genuine enthusiasm for religious subjects a pure and healthy feeling for nature, and a talent for portraying her minutest details with truth and fidelity, had continued till the fifteenth century, and in some instances even later, to produce the most admirable works, combining the utmost technical perfection in touch and finish with most vivid and beautiful colouring. To this original school, however, had succeeded a perverted rage for imitating the Italian masters, which had been introduced into the Netherlands by a few painters of talent, particularly by Jean Mabuse and Bernhard van Orley. To display their science by throwing their figures into forced and difficult positions, and strongly marking the muscles, by which they thought to emulate the grandeur of Michael Angelo, and to exhibit their learning by the choice of mythological and allegorical subjects, became the aim of succeeding painters; and before these false and artificial views of art, the spirit of religious enthusiasm, and the pure *naïve* perception of the truth and beauty of nature, gradually disappeared. In proportion as the Flemish painters lost the proper conception of form, and the feeling for delicacy and beauty of outline, it followed, of course, that they became more and more removed from nature in their desire to rival each other in the forced attitudes of their figures, and in the exhibition of nudity, until, at last, such disgusting caricatures were produced as we find in the works of Martin Hemscherk or Franz Floris—artists who were even deficient in good colouring, the old inheritance of the school. Some few painters, however, whose feeling for truth and nature repelled

them instinctively from a path so far removed from both, took to portraying scenes of real life with considerable humour and vivacity, or they delineated nature in her commonest aspects with great minuteness of detail: and thus *tableaux de genre* and landscape-painting originated. Despite the great merits of many of these works, they are nevertheless deficient in unity and simplicity of character. In the conception they display a vulgar taste, and a frequent straining after singular and extravagant effects. The artists of the Netherlands in the sixteenth century appear to most advantage in portrait-painting; for here they were reduced to the necessity of copying nature: but, even in this department, few are altogether exempt from affectation and stiffness. Although a few isolated efforts to introduce a better state of things were visible towards the end of the sixteenth century, it was reserved for a mind of no common power to bring about a complete revolution in [art. Such?] a mind was that of Rubens himself. A thorough Fleming in temperament and character, he led his countrymen back to the very point whence sprang their original excellence—the lively perception of natural forms, and the development of the faculty of colour. But the spirit of the times in which he lived, and the peculiar temper of Rubens's own mind, naturally prevented these characteristic qualities from being exhibited now as they would have been in the age of the Van Eycks. It had been the aim of the latter, as far as their means allowed, in the colouring as well as in the execution of their works, so to imitate nature, that their pictures, whether looked at closely, or contemplated from a distance, should produce, as nearly as possible, the same effect; the principal thing with Rubens, on the contrary, was the general effect; and though he painted the details with the greatest truth, he contented himself with making them subordinate to the whole, so as to resemble nature at a certain distance. The means which were at his command in his own time for the accomplishment of his purpose,—a better knowledge of the laws of perspective, and of the chiaroscuro, that breadth of style first introduced by Titian and his school, and then so admirably practised by Michael Angelo de Caravaggio, and the Caracci, these he had mastered with the greatest energy during his long residence in Italy; and the more successfully, as they perfectly accorded with the nature of his own genius. But instead of that genuine religious enthusiasm, long since vanished, which had formerly inspired the Van Eycks, so as even to spread a certain solemnity over their scenes of passion, the mind of Rubens was so imbued with the love for dramatic representation, that he imparted life and movement even to subjects which properly demanded a certain calmness and repose in the treatment. A most glowing and creative fancy, inexhaustible in the conception of new forms full of life and vigour, would naturally find even the easiest method of acquiring some method of transferring its creations to the canvass in the shortest time possible. His rare technical skill, and his extraordinary faculty of colour, aided Rubens admirably in attaining this object. He obtained at once the art of placing, with a master hand, the right tones in the right places, without trying all kinds of experiments with the colours on the pictures themselves; and after he had with ease blended them together, he knew how to give to the whole picture the last finish by a few master touches in those parts which he had left unpainted for the purpose.

This mode of treatment, so characteristic of the turn of Rubens's mind, is the reason why his pictures bear the stamp of an original burst of fancy more than those of any other painter. Hence Rubens, beyond any artist of modern times, may be styled a sketcher, in the highest and best sense of the word. If the greater part of his pictures bear upon the whole the character of a cheerful, jovial spirit, undisturbed by outward misfortunes, and a strong feeling of self-complacency, still these qualities are more particularly expressed in the style of his colouring. Rubens, as a colourist, might be called the painter of light, as Rembrandt is the painter of darkness. With Rubens, every thing is imbued with the pure element of broad light; the different colours are brought close together in luxuriant contrast; but in their harmonious relation to each other they celebrate a common triumph. Thus many of his large pictures, for instance, the 'Assumption of the Virgin' in the cathedral of Antwerp, may be said to produce the same effect as a symphony, in which the united sounds of all the instruments blend together joyously, divinely, mightily. No other painter has ever known how to produce such a full and satisfactory tone of light, such a deep chiaroscuro united with such general brilliancy. Few can be compared to him in the admirable gradations in the keeping of the whole, and in the manner in which each variety of surface is distinctly pronounced; the colouring of his flesh in particular has such a vivid transparency of tone—such a glow of life—that it is easy to understand how Guido Reni should have been struck with wonder upon beholding a picture of Rubens for the first time, and exclaim, 'Does this painter mix blood with his colours?' The creative fancy of Rubens was capable of conceiving every possible variety of subject at all fitted for the pencil, and the sphere was indeed ample from which his remarkable cultivation of mind enabled him to select. Thus he painted subjects from the Bible, from the legends of saints, from ancient and modern history, and from classical mythology; portraits, and conversation pieces; battle, and hunting pieces; grotesques and landscapes. With regard to fertility of invention, Raphael and Albert Dürer are the only modern painters who can be compared with him. There is the greatest difference, however, between Raphael and Rubens in this respect, as Baron von Rumohr has well remarked; for the peculiarity of Raphael consisted principally in the perfect comprehension of his subject, and in proving on the canvass that he had penetrated into its inmost signification; whereas Rubens made every subject conform to his own most one-sided nature, and he accordingly treated all such as were foreign to it in a most capricious manner. Therefore it is, that while all the works painted by Rubens himself bear the true stamp of genius, and captivate us by the originality and freshness of thought exhibited in them, as well as by the masterly keeping, the vigour and glow of the colouring, and the talent displayed in the treatment altogether, yet the gratification we derive from them is ever in proportion to the harmony which existed between the subject and his own natural disposition. To the man's individual nature we may trace the most striking characteristics of the painter,—his turn for dramatic conception, his loose and sketchy treatment. To the jovial, buoyant hilarity of his temper, we owe his decided taste for the powerful, the coarse, the sensual, which allowed him but seldom to

approach to a finer appreciation of form, and, only in some few instances, to the dignified expression of elevated and noble, or even of soft and gentle characters. In truth, he was so little able to divest himself of those impressions of the human form which had been early engrafted on his mind in his native country, that even when he copied from other masters—for instance, from Leonardo da Vinci—he unconsciously translated all the heads in his Flemish manner, and gave to the other parts of the body that amplitude and heaviness of character which was usual to him. Generally speaking, it is impossible to derive unmixed pleasure from those works of Rubens in which the subjects are taken from the sacred writings, where so much of the effect depends on the elevated expression of moral beauty, sanctity, purity, and calm beatitude; even in the treatment of subjects from the mythology of the ancients, indelibly associated in our minds with the idea of divine gracefulness and delicacy of form, Rubens was seldom successful: not only was he naturally deficient in the perception of such qualities, but here more particularly, his rash and rapid treatment, the want of study, defective drawing in the figure, and the capricious and unquiet arrangement of the drapery, are frequently and disagreeably felt. His representations of the Madonna but seldom, and his representations of the Redeemer scarcely ever, excite those ideas which we should consider appropriate and worthy of those divine subjects."

After mentioning some noble exceptions to his last remark, Dr. Waagen proceeds to describe in detail a number of Rubens's *chefs-d'œuvre*, in the various classes of subjects in which his pencil luxuriated. The description is accompanied by valuable critical observations.

Mrs. Jameson's notes are written in a very lively style, evince her usual acumen, and communicate much interesting information, supplementary to the text. We could not help smiling at the highly characteristic comment appended to Dr. Waagen's account of the "atrocious" picture, in which Rubens has represented women defending themselves from violence "by biting and scratching." But (we end our notice as we began it) Mrs. Jameson is quite right.

*A Letter to the Right Hon. C. W. W. Wynn, M.P. &c. &c., on the Danger to which the Constitution is Exposed from the Encroachments of the Courts of Law.* By Sir Graves Chamney Haughton, K.H. M.A. F.R.S. &c. &c. Pp. 50. London, 1840. Allen and Co.

THIS is a very able pamphlet on the late struggle in which the House of Commons was engaged with the publisher of "Harriet Wilson" and his attorney; of which Sir Graves Haughton takes an enlarged and highly constitutional view. Besides its application to the question at issue, it presents some striking passages in the course of its argument, which we feel disposed to exemplify for their separate value.

"The study of law, in which the whole fiction of the feudal system is still retained, being the necessary preparation of our statesmen, they seem to be always under its guiding influence. Hence the anxiety of those who brought about the revolution of 1688 to make it appear legitimate as well as just."

The balance of power in a limited monarchy can only be kept right by a nicely poised opposition. A wise and constitutional monarch, therefore, will give each of the opposing parties its fair share of action and influence. He may feel quite assured, that whatever party is in, it will, whatever may have been its previous pledges to the contrary, lean to the interests of the crown: and, for the

same reason, the people will find their interests warmly taken up by the party in opposition. Where this principle is not attended to, the party that has been long excluded must carry on the business of government under the most adverse circumstances, and be driven to the employment of measures hostile to its own feelings, and to the best interests of the state. The alternate possession of power, therefore, by either party, should never exceed a few years. The monarch ought to feel that his own welfare, and with it that of the constitution, must be compromised, sooner or later, by a predilection for any particular party: for he would create an oligarchy, that would eventually tie him hand and foot.

The attempt to assume the right of questioning every authority in the realm, however high its station, cannot but create much confusion, as well as great impediments to public business; and that, too, at a period of considerable difficulty, as regards the foreign and domestic relations of the country. Besides, the judges of the Court of Queen's Bench should have remembered, that they had proved themselves to be no more infallible than the rest of mankind; and as so many of their decisions had been reversed, in which they were all unanimous, it was no more than became consideration men to hesitate before they assumed so new and, to say the least, so doubtful a jurisdiction.

The attempt of courts of law to extend their jurisdiction is not rare; but on all occasions should be steadfastly resisted, or public affairs would from time to time be brought into irretrievable confusion. It is not long since the then King's Court established in the town of Bombay attempted to extend its authority over the whole presidency; thereby causing the greatest alarm among the native population, and much inconvenience to the local government. In such cases, there is an *esprit de corps*, that supports and misleads those who have the hardihood to make the attempt; and the necessary fictions, by which the authority of courts of law is extended from time to time, create a perpetual craving for enlarged and real jurisdiction.

To this common failing, which may be the cause of so much mischief, we may likewise add the peculiar views that belong to a lawyer's mind, from the nature of its training. Nothing can be seen by him except through a legal medium; and when he hears of any difference between man and man, he immediately reduces it to a case of libel, of covenant, of debt, of assumpsit, or some other of the divisions of actions. He is like the calculating boy, who, when taken for the first time to the theatre, employed himself in counting the audience, instead of attending to the play. His eye distorts every form, and changes every colour; and if by any chance a ray of pure sunshine shoots athwart the gloom of his court, so unusual and unwelcome an intruder blinds him by its dazzling splendour. We occasionally find some few fortunate individuals, whose visual organs can adapt themselves to the necessities of courts of law, and to the ordinary scenes of life; but the case is so rare, that scarcely any lawyer, however eminent, has made a great statesman. The mind of a lawyer is sharp and keen enough; and may be compared to a fork, which can only take up solids of a particular kind: but it wants the universal capacity of a spoon, which can not only take up all kinds of solids, but fluids as well. Should a subject occur into which he cannot stick at least one prong of his fork, he has no means of conveying it to his understanding. He can only deal with persons; and he is, consequently, unable to discriminate between a man in his individual and his collective capacity. He knows that the members of both houses, as subjects of the realm, are amenable to the law; but he knows not that the bodies they compose cannot be considered as John-a-nokes or John-a-stiles; that is, either as plaintiff or as defendant.

The really weak spot in the British constitution consists in the encroaching spirit and contumacy that may be successfully exhibited by the judges, under circumstances like those that have just occurred; and which, so far from being checked by public opinion, may, through ignorance of the constitution and the nature of the case, be fomented by popular clamour. So much for all the cant respecting "the march of intellect in the nineteenth century!" It is clear, that what knowledge gains in surface it loses in depth."

The force of the last axiom, so happily expressed, is worth a voluminous essay. With regard to Sir Graves's main argument, it seems to us to be fallacious in this—that it treats interference with or opposition to the House of Commons as if it were the whole legislative power, whereas it is only a third portion. Thus:—

"Judges have so far forgotten themselves, as to claim superiority over the legislature! It would, indeed, be a strange confusion of right and wrong, if the Houses of Lords and Commons could be supposed to have made themselves amenable to the jurisdiction of the courts of the sovereign by their generous interference to protect such tribunals from being subject to royal caprice! If, in 1689, parliament became the judge and protector of these courts of law, how is it amenable to them in 1839?"

Lord Denman "thought, if they might judge from what was said elsewhere, the object was to insult the courts of law, as if they were not fit to be trusted with any powers which might be brought to bear against the House of Commons. Now, he asked their lordships whether the judicial authority deserved such a stigma? Here it is clear that the author of these sentiments had

totally forgotten, or supposed his hearers had, that the House of Commons was a master, and himself but a servant, and that, as such, respect and obedience were his first duties."

And, again:—

The judges "must feel that, by doing so, they can give no man occasion to blame their conduct. But fully as they are prepared to do their duty, they are bound to remember that the jurisdiction of any court appointed by the sovereign can only extend over the subjects of the realm; and that should a case occur in which a subject thinks he has reason to complain of their common master, 'the absolute, supreme power of the state,' that is to say, of the legislature, or one of its estates, the Court of Queen's Bench has no power to enter upon its consideration. Were that court fitted by the constitution for so high an office, it would then be higher than the legislature, and possess the power of questioning it in all its acts, and stand in the very contradictory position of having the power to rule it at its pleasure, and yet of being bound by the laws it frames!"

"That court has no more right to make the legislature, or any of its estates, amenable to its jurisdiction, than it has to frame the laws of the land: indeed, the attempt on its part must expose it to as much ridicule among reflecting men as if it had given judgment against the Emperor of Morocco."

But, after all, the point at issue seems to be whether the three estates having made laws, each individual of these three (or the whole triunion while the laws exist) is separately protected from their administration? We are not wise enough to solve the difficulty.

#### BENNETT'S VOYAGE ROUND THE GLOBE.

[Concluding notice.]

WE have now to conclude our review of this work, which we do with our promised extract relating to the molluscs, so interesting to natural history:—

*Molluscs.*—"Carinaria Vitrea.—Our first acquaintance with this extraordinary *Heteropod* (which would appear to hold a station intermediate to testaceous and naked molluscs) occurred off Pitcairn's Island, by the capture of two living examples near the surface of the deep blue water which surrounds that coast.

The Carinaria Vitrea.

The Pyrosoma.

We subsequently met with specimens in other parts of the Pacific, from lat. 3° to 33° N., and from 2° to 26° S.; and also in the Straits of Timor. The average length of the species is two inches. Its structure is gelatinous, sufficiently firm (being invested in a stout membrane), and semi-pellucid. The body is smooth, cylindrical, arched, and tapers to a point at the tail. It has, in its interior, an

opaque oval viscous of an amber colour. The head is chiefly to be distinguished by a circular mouth, and a black speck, planted on each of its sides, and which would appear to perform the office of an eye. The mouth has projecting lips, and contains a long, hard, and cylindrical tube, or tongue, provided on its inner margin with short rigid hooks, which are alternately projected and returned by a rapid rotatory motion: the protrusion and retraction of the hooks being attended by similar changes in the tube itself. An erect cylindrical fin arises from the posterior third of the back, and a broader fin occupies the corresponding surface of the abdomen. The dorsal fin is covered by an exceedingly delicate and beautiful vitreous shell, of small size, perfectly transparent, and shaped like a cornucopia. Some few examples of the same species, which we obtained, were destitute of this shell; and their naked dorsal fin bore no appearance of its having been recently present. I have also found the shell alone, floating empty on the surface of the sea.

"The *Pyrosome* is, strictly speaking, an aggregate tunicary, or body composed of an aggregation of small animals, perforated at both extremities, united at their bases, and enclosed in a common membrane, or tunic. I shall, however, for the convenience of description, speak of it as of one complete animal. The average size of the specimens we procured was from four to six inches in length, and from one and a half to two inches in circumference. The body is cylindrical, and rounded and impervious at one extremity, while the opposite is flat, and perforated in its centre by a circular orifice, conducting to a capacious straight tube that occupies the interior of the body. It is colourless, and its surface is studded with pearly tubercles, perforated at their apices, and spread with many papillous appendages. The structure of the body is gelatinous, and contains myriads of small brown specks, in which the phosphorescent power, for which this mollusc is so remarkable, would appear to reside. When assembled in the sea, and, as is usually the case, near the surface, these creatures present a gorgeous spectacle; their vivid phosphoric light being sufficient to illuminate, not only the extent of ocean they occupy, but also the air above, rendering all surrounding objects visible during the darkest night, and permitting a book to be read on the deck, or near the stern-cabin windows of a ship. They are occasionally collected together in incredible numbers: on two occasions, at midnight, in lats. 2° and 4° N., Atlantic Ocean (when I had the good fortune to see these molluscs in their zenith of splendour), the ship sailed over many miles of water which they had illuminated, and in which they were so densely crowded as to be taken to any amount by buckets or nets. When captured, they exhibited no signs of animation, and emitted a peculiar half-fishy odour. When kept in a vessel of sea-water, and allowed to be tranquil, their light was withheld, or only sparingly displayed; but when they were handled, or the water in which they were contained was agitated, their body instantly became one blaze of phosphoric light, which, upon close examination, could be observed to proceed from myriads of luminous dots, occupying the situations of the small brown specks noticeable in the fleshy structure of the mollusc. Upon the irritating cause\* being removed, the phosphoric light gradually expired, and the pyrosome remained in darkness until again disturbed,

turbid, when it once more illuminated surrounding objects with its vivid gleam; and this was repeated until after the death of the animal, when no luminous effect could be reproduced. When living specimens were immersed in fresh water, they not only existed for some hours, but emitted a constant light; even after they had been so much enfeebled as to cease to give light in sea-water, or after they had been seriously mutilated, their phosphorescence invariably reappeared when they were put into fresh water, which appears to act as a peculiar stimulus in reproducing the phosphoric light of these, as well as of most other marine luminous animals. The pyrosome does not communicate its luminosity to water, nor to any object in contact with it (like many luminous medusæ), its body being enveloped in a membrane that has no luminous secretion. But when the mollusc is cut open in water, some of the brown specks before-mentioned will escape, and, diffusing themselves through the fluid, shine independent of the animal: in this respect, as well as in their structure and colour, bearing some resemblance to the luminous scale on the abdomen of the small fire-fly of Bengal. When this mollusc is first removed from the sea, the orifice, or mouth, at one extremity of its body, is nearly as wide as the tube within; but, should the body be much handled, and kept long in water, this orifice closes by the contraction of a smooth membrane that surrounds it like a *sphincter*, water being at the same time retained within the cavity of the body. This contraction of the sphincter membrane is the only movement I have seen the pyrosome effect; although it is said that the creature has also the power of contracting and dilating its entire body."

With these extracts we conclude our notice of a publication which well deserves to be ranged on the shelf with our best and most instructive Voyages.

#### MISCELLANEOUS.

*Acheen, and the Ports of the North and East Coasts of Sumatra; with incidental Notices of the Trade in Eastern Seas, and the Aggressions of the Dutch.* By John Anderson, Esq. late of the E. I. C. Civil Service, Pinang, Singapore, and Malacca. 8vo. pp. 240. London, 1840. Allen and Co.

A MAP and succinct description by one who has served in these parts makes us better acquainted with Sumatra, Banca, Lingin, Billiton, &c. &c. than when they are casually mentioned in larger works; but the chief interest of this volume lies in its pointing out our past relations with Sumatra, and directing attention to the means, apparently systematically, pursuing by the Dutch government to assume an ascendancy in the Eastern seas injurious to English commerce and power.

*Moxon's Edition of Beaumont and Fletcher.* (With Mr. George Darley's Introduction).

WE have now before us eight more parts (VIII. to XV.) of this clearly printed and handsome edition. One other part completes it. Need we hint what treasures of poetry and genius are here garnered up? No! generations have acknowledged and will acknowledge them.

*Timon, but not of Athens.* 2 vols. 12mo.

London, 1840. Saunders and Otley.

WHEN we read the first few pages of this book, we at once acknowledged the talent of the writer, and looked forward to a literary and mental treat from his labours. But as we advanced the scene changed,—not that the talent failed,—but we found we were engaged on a series of fierce democratical diatribes against

the church, the aristocracy, the government, the legislature, the religious party called saints, and, in short, against nearly all existing society and established institutions. Having run this muck, we can only report that the author is a person of no common ability; and that, in the course of his work, he introduces an account of the early differences between the late Queen Caroline and George IV., which he seasons with the strongest revilings of the latter.

*The Poems of Schiller Explained; with a Glossary, &c.,* by Edmund Bach, of the British Museum. Pp. 141. (London, Black and Armstrong.)—Though purporting to be only a key to Schiller's Poems, this little volume contains much of interest for the German scholar and critic; and at the same time suggests the value of poetical thoughts and expressions which are applicable to all languages. As illustrations of the poet himself, every page may be consulted with advantage; but, perhaps, the higher use of the book will be the glimpses of insight it gives us into the copious language in which he wrote.

*Eighty French Consonants, &c.,* by J. Tournier. Pp. 68. (London, Templeman.)—A very small tome, with some useful observations on the French language.

*A Letter to the Human Race,* by a Brother. Pp. 91. (London, Wilson.)—Such a letter should be prepaid. It is meant for the lower orders, and uningles many objectionable with unobjectionable principles and opinions.

*Histoire d'Angleterre,* par M. A. Roche. 8vo. 2 vols. (London, Dulau and Co.)—This history, compiled from the best English historians, and those of France who have treated of English history, is written principally for the consideration of youth, and is, in fact, a *résumé* of the lectures which the author has delivered as Professor of History. The language is good, and the statements and opinion fairly impartial. The work, therefore, will be found serviceable for readers who desire at the same time to become acquainted with the history, and improve their knowledge of the French tongue.

*A Letter to Dr. Chambers, &c. relating to the Nature and Proper Treatment of Gout,* by Sir C. Scudamore, M.D. F.R.S. &c. Pp. 59. (London, Longman and Co.)—No one has written more effectually on the subject of gout than Sir C. Scudamore, and those who suffer from that painful disease will hasten to read this new exposition of his further experience. He approves of colchicum, not as a specific, but sparingly administered as an auxiliary to temperance in diet, varying with every individual constitution. Other points of interest are also raised and explained; the result of which is that there is no specific remedy, though the disorder may be much alleviated by skilful treatment.

*The Sacred Epistles Explained, &c.,* by Jeannette W. Dawe. Pp. 216. (London, Smith, Elder, and Co.)—“Familiarised for young Christians,” with geographical and descriptive notices at once useful and pleasant.

*The Festivals of the Lord, &c.,* by Morris J. Raphael. Pp. 156. (London, Sherwood and Co.)—An account of the Jewish festivals all over the world, one of the immediate objects of which will show that the horrid crime alleged against the Israelites at Damascus can have no foundation in any of their rites or ceremonies.

*Popular Outlines on the Principles and Practice of Homœopathy,* by F. Blagdon Harral, Surgeon. Pp. 13. (London, T. Hurst.)—This little book is like a homœopathic dose of publications. It is very small, but gives a favourable outline of the doctrine supported by Mr. Harral.

*Dictionary of the Art of Printing.* No. 1. By W. Savage. 8vo. pp. 48. (London, Longman and Co.)—The commencement of a very useful work, to the progress of which we shall look with interest. There is much curious information in it.

#### ARTS AND SCIENCES. GEOLOGICAL SOCIETY.

APRIL 8. The Rev. Dr. Buckland, President, in the chair.—The following communications were read:—1. ‘On the great Fault called the Horse, in the Forest of Dean Coalfield,’ by Mr. Buddle. The term fault is not employed in this case to designate the dislocation, but the thinning out of a stratum; and the horse is a mass of sandstone, which occupies the place of a portion of a coal-seam called the Coleford High Delf, or the 23d from the surface. Its extent is not known, but it has been traced for about two miles; and its breadth has been ascertained to be from 270 to 340 yards. On each side of the horse the thickness of the seam varies greatly, in consequence of the upper surface presenting considerable depressions, called by the colliers “lows,” but the under surface is generally level. The roof of the seam is formed of the same sandstone as the horse, and the floor is composed of shale. The coal under the lows is generally deteriorated.

\* “Friction is not the only cause of the pyrosome emitting its light; for the slightest touch on one part of its body is sufficient to illuminate the whole.”

rated by an admixture of particles of the sandstone of the roof, but it contains no erratic boulders, angular fragments, or gravel. In the sandstone forming the roof there are ferruginous sandstone concretions or nodules, some of which are separable from the matrix; also angular fragments of imperfect casts of vegetables; and in some parts of the horse and lows is a sandstone breccia, formed of quartz pebbles, fragments of coal, ironstone, and vegetable remains. The sandstone extends to the surface in the portion of the field immediately over that in which the horse has been traced; there are, however, no indications above-ground by which the fault can be followed beyond the limit to which it has been explored in the workings. In its under-ground character the horse is similar to the "washes" in many coal districts; but it differs in not lying beneath the bed of a river, or in the bottom of a valley, or extending upwards through the strata and showing itself on the surface. Future workings must determine whether in other portions of the field the horse affects the overlying beds of coal; but in the Park End Colliery, situated 50 fathoms above the Coleford High Delf seam, and about two miles to the south-east of the fault, in the direction of its probable prolongation, a great succession of lows has been met with. Respecting the origin of the Coleford High Delf seam, and the phenomena presented by the horse as well as by the surface of the coal, Mr. Buddle is of opinion that the seam was accumulated in a deep, tranquil lake; and that the total excavation of the coal at the "fault," and its partial removal in the vicinity, were effected during a drainage of the lake, and previously to the deposition of the overlying sandstone, the "horse" being due to the action of the principal stream, and the undulations on the surface of the coal to minor collateral currents. The paper was illustrated by a beautiful model, constructed by Mr. Sopwith.—2. 'Remarks on the Structure of the Royal George, and on the Condition of the Timber and other Materials brought up during the Operations of Col. Pasley in 1839,' by Mr. Creuze. The Royal George was the first ship built on the improved dimensions recommended in consequence of an inquiry into the superior sailing qualities of the vessels of war in the French and Spanish services. She was commenced at Woolwich in 1746, launched in 1756, and after bearing a very high character as a ship-of-war for twenty-six years, was accidentally sunk at Spithead on the 29th of August, 1782. From an examination of the various portions of the wreck recovered by the operations of Col. Pasley, Mr. Creuze states that the great agent in the work of destruction during the fifty-seven years since the loss of the Royal George has been "the worm," which has gradually, by its innumerable perforations on every exposed portion of the wood-work, reduced it to such a state as to enable the constant wash of the tides to abrade it layer by layer. The portion of the ship which has been thus removed is considered to be the whole of the upper part, including the topides above the line of the middle-deck ports. The portions of the recovered timbers which had been buried in the mud were perfectly sound; and Mr. Creuze is of opinion that the bottom of the ship, which is thus protected, and too deeply imbedded to be affected by the explosions, will last for ages. Some portions of the copper have undergone so little change that several whole sheets average the same weight per square foot as those now used in the royal

navy; and this state of preservation, Mr. Creuze believes, may be accounted for on the principle applied by Sir Humphry Davy to the protection of the sheathing of ships. The cast-iron guns which have been recovered were so much softened as to be easily abraded by the finger-nail to the depth of one-sixteenth and one-eighth of an inch, but they gradually hardened on exposure to the atmosphere. The brass guns are as sharp in their ornamental castings, and apparently as sound, as at their first immersion. A piece of two-and-a-half inch cable-layed cordage, made from a specimen of tarred rope (possibly part of the ship's old junk for sea-store, or of one of the cables used in an attempt to weigh her soon after she sunk), was found to bear 21cwt. 3qrs. 7lbs.; while a similar cable, made from yarn spun in 1830, bore only 20cwt. 1qr. 7lbs. Mr. Creuze then stated some peculiarities in the structure of the Royal George, and concluded with a descriptive catalogue of a series of specimens which accompanied the paper.—3. A letter by Mr. C. Hullmandel, 'On the Subsidence of the Coast near Puzzuoli.' In the year 1813, Mr. Hullmandel resided for four months in the Capuchin Convent at the entrance of the town of Puzzuoli, and situated between the road from Naples and the sea. The oldest friar, then ninety-three years of age, and styled "il molto reverende," stated that the road, when he was a young man, passed on the seaward side of the convent, but that, from the gradual subsiding of the soil, it had been found necessary to alter the course. While Mr. Hullmandel resided in the convent, the refectory and the entrance-gate were from six to twelve inches under water whenever strong westerly winds prevailed; but thirty years before such events never took place. The small wharf at Puzzuoli is also constantly under water during westerly winds. These circumstances, Mr. Hullmandel thinks, prove a gradual subsidence of the soil; because it is not probable that the builders of the convent and of the wharf would have so placed their structures as to have exposed them to inundations.—4. 'A Notice on Borneo Proper,' by Mr. Tradesant Lay. Borneo Proper consists, as far as the author's observations extended, of sandstone; but near the mouth of the river, flowing past Borneo city, is an islet which yields coal, and is called by the natives Palu Cleonin, or Mirror Island,—in allusion, Mr. Lay supposes, to the brightness of the coal. Lignite is also found in sandstone at a place called Kianggi, situated in a deep valley or ravine, not far from Borneo city. The bed extends obliquely from one bank to the other, at an angle of about 45°, with a rivulet, and it is stated to be more than two yards in breadth. The whole of the peninsula constituting this part of Borneo is formed of sharp steep hills, which gradually become more lofty towards the south-west, but upon the main land on the other side of the river the ridges are supposed to range at right angles to the mountains. Their composition is a very soft sandstone, alternating with clay; but at one point, on the summit of a hill, Mr. Lay noticed the outcrop of a hard red sandstone, composed of angular and rounded masses of quartz, black mica, and a ferruginous cement.—5. 'On some Geological Specimens from Syria,' by Mr. Williamson. The specimens were collected by Mr. Heugh, who also furnished the author with a few notes respecting the localities whence they were obtained. The chief points are the vicinity of Beyroot, and Gebel Suneen, which rises immediately above that town, and constitutes the south-

eastern ridge of the Lebanon range. The formations comprising the tongue of land on which Beyroot stands are a hard cream-coloured limestone, containing layers of flints, and an overlying soft calcareous rock, used in masonry on account of its withstanding the shocks of earthquakes better than the compact limestone. The structure of Gebel Suneen is as follows:—Compact limestone, forming the base of the mountain, 1200 to 1500 feet; coarse silicious conglomerate, containing seams of lignite, 800 feet; compact limestone, abounding in fossil shells, 2000 feet; a ferruginous rock, formed of grains of sand thickly coated with hydrated oxide of iron, 50 feet; a seam of oysters, which may be traced around the mountain; and compact limestone, 100 feet, forming the summit of the mountain.—Mr. Williamson does not venture to define precisely the age of these rocks; but from the general resemblance of the shells he believes that it may be considered to be nearly that of the cretaceous series. The collection contains specimens of *Clypea brevissima* from near Tupoli, on the road to the Cedars, about thirty miles north of Beyroot.

## ELECTRICAL SOCIETY.

TUESDAY, 19th.—Read, a paper by Mr. Pollock, 'On the Application of Dr. Black's Law of Capacity to the Explanation of Electrical Phenomena.' The law was applied to the explanation of the phenomena of the Leyden jar, of Zamboni's pile, and of the secondary wire: the first set included the charge of the Leyden jar, comprising induction and insulation, and the discharge, with the phenomenon of the shock; the second, the action of Zamboni's pile dependent upon induction, not conduction; induction the effect of expansion or contraction from the motion of latent heat; insulation in a ratio with expansibility, as in the case of air, and the action of the pile while charging and discharging; the third, the disturbance of the equilibrium of the latent heat of a secondary wire by the primary current. These were the several divisions and subdivisions of the subject. The conclusion Mr. Pollock draws from an examination of the affections of the latent heat in the several instances discussed is, that "there can be no separate or distinct electric fluid but the latent heat of bodies." Because, he says, by change of capacity in the Leyden jar, Zamboni's pile, and the secondary wire, the equilibrium of their latent heat is disturbed, and on the restoration of the equilibrium taking place through the human body, the electric phenomenon of the shock is felt. This is true of the disturbance and restoration of the equilibrium of the electric fluid, upon which the phenomena of the charge and discharge seem to depend. But it appears to us, on a slight consideration of the subject whilst writing these remarks, an assumption not at all borne out by facts, that in either of the cases stated the latent heat of the bodies is increased or diminished. Electricity has been proved to be, and especially in the case of the Leyden jar, all deposited on the surface of bodies. This requires no change of capacity in the substances upon which the fluid may be accumulated. And, besides, if the latent heat of bodies be increased or diminished, a change of condition—a sensible change—would necessarily ensue; that is, in relation to solidity, plasticity, fluidity, or the gaseous state. Doubtless, however, Mr. Pollock has well considered the subject in all its bearings.—Read, also, 'An Account of a new and cheap Method of obtaining Copies of Medals, Coins, &c., by the Galvanic Process.'

## ROYAL INSTITUTION.

FRIDAY, 15th.—Mr. Macilwain 'On Respiration, and its Relation to Animal Temperature.' The opinion that the lungs of living beings generate heat by the chemical action which is supposed in them to occur during respiration by the absorption of oxygen, and by the expulsion of carbonic acid, has been entertained by men of great eminence. It is, however, by no means proved; nor is it, according to Mr. Macilwain, tenable. He conceives that their operation is to regulate and adjust, not to generate, heat. The facts in support of this view are most numerous, and it is based on most extensive induction. Time, he observed, however, would only permit him, on this occasion, to enter upon a limited induction—to do little more than suggest for others' inquiry. And space will only allow of our touching very lightly this interesting subject. The facts brought forward strongest in support of the illustrator's opinion were, the breathing of the frog through his skin during cold weather, but with his lungs also, if the temperature be raised; the torpor of the snail in extreme hot or cold weather, but with the remarkable difference that, in the former case, the lungs are in action, whilst in the latter they cease their functions; the similar effort of the skin and lungs to relieve the oppressed horse when first galloped, by the cooling effects of evaporation, and by the exposure of the blood to atmospheric influence; and, lastly, because of our limited space, the excessive heat of diseased lungs, which is only reconcilable to their operation being a cooling one when in healthy action. The subject was ably treated.—When Mr. Macilwain concluded, Mr. Faraday directed attention to a shot which had been received from Woolwich. Experiment had shewn that by filling a hollow iron shot with lead, its speed and force, when fired, were greatly increased; but a singular effect on the heavier metal was observed, the lead was found to have receded, to have been compressed into one half the space it occupied previously to being discharged from the gun. In the case exhibited, the iron case or shell had been filled with leaden bullets, round of course, but after being fired and the iron shell broken, it was seen that all the balls had coalesced, each sphere had become a polyhedron, and complete aggregation had ensued. This effect is doubtless attributable to the difference of inertia in the two metals, and to the instant of time that elapses before the inner metal is acted upon by the enormous force of the explosion.

## MR. SPENCER ON SOLDERING METALS.

'On the Theory and Practice of Soldering Metals,' by Thomas Spencer.—The process of uniting lead to lead, and other metals, without solder, has recently attracted considerable attention. It was introduced into this country, and made public, about a month ago, from France, by the patentees. But it appears that, previously to this, Mr. Spencer had investigated the theory and practice of soldering; had discovered by ingenious reasoning and experiments the identical process; had given notice to the Liverpool Polytechnic Society of a paper on the subject; and had detailed the principles to a number of individuals, members of that Society, and to persons practically engaged in business requiring the process. The paper, however, was read on the 14th, and was published in "The Liverpool Journal" of Saturday last, the 16th May. Thus delay and untoward circumstances have again de-

prived Mr. Spencer of the fame of inventor or discoverer, although all who read his paper will be satisfied that his views, reasonings, and experiments, were original, and will award him the credit and praise due to his sagacity and success. The former case to which we have alluded is the electrolyte, as it has been since termed, the discovery of which has been attributed to Professor Jacobi of St. Petersburg, in consequence of his allusion to the elements of the process in a letter to Mr. Faraday, published in the "Philosophical Magazine" of September of last year, although Mr. Spencer had given notice of his paper to the British Association in August, but which was prevented being read for the reasons given in his pamphlet in October last. This publication described the whole process, and contained suggestions upon which most of the recent improvements of the electrolyte have been based. But enough upon this point: the important inventions, as yet in their infancy, will continue to benefit mankind long after the names of the inventors will have passed away; and this the more likely, as neither of the processes have been named Delbueckotype, Reichmondtype, Spencertype, or Jacobitype; and each of these individuals will have had the satisfaction of believing that he had contributed to the knowledge of his race. The immediate subject, however, under notice is the union of metals without solder, and we avail ourselves of the details in "The Liverpool Journal" to give a brief sketch of the novelty. Mr. Spencer, from various experiments to investigate the philosophy of soldering, had observed that hydrogen was always present, and that too in a state of comparative freedom; and supposing that this gas was the predisposing cause of the adhesion in the process of soldering, it appeared highly probable that any substance that would admit of a still greater portion of hydrogen being set free by the soldering-iron, would, in a practical sense, answer the purpose still better than resin. He then proceeded to ascertain the substances having a chemical composition analogous to resin, and he found the following, which are arranged in a tabular form with reference to their relative value in free hydrogen:—

	Carbon.	Hydrogen.	Oxygen.	Hydrogen unconnected with Oxygen.
Pure naphtha.....	6	6	0	6
Bees' wax.....	13	11	1	10
Oil turpentine.....	13	10	1	9
Resin.....	13	11	2	9
Camphor.....	10	8	1	7

All these substances were employed for the purposes of soft soldering, and had superiority the one over the other, in proportion to the quantity of this gas liberated. This induced him, in the next experiments, to project a jet of hydrogen on the metals to be soldered, using the hot iron as ordinarily, and he at last succeeded in causing complete adherence between two metals when the gas was perfectly dry; but, in order to get rid of the hot iron altogether, the oxy-hydrogen flame was employed, the heat of which, however, was found too intense, until decreased by the super-addition of an equal portion of atmospheric air. And now, a stream of the gases thus diluted being ignited, and the flame directed on a piece of tin to be attached to a piece of sheet copper, adherence at once took place. Mr. Spencer next directed the flame on two pieces of lead, the edges being brought together; but found that the flame was far too intense, a hole being fused wherever the flame was directed, and apparent oxidation took place on the surface. To get rid of the intensity of the flame, he added a greater por-

tion of atmospheric air; and, on doing so, found it very much less intense: but, at the same time, it rapidly oxidised the surface of the lead, and adhesion between the two pieces took place very partially. It appeared now abundantly evident, that there was an absence of hydrogen, and, to supply the apparent deficiency, he added a portion of it to the gas-holder containing the mixed gases and the air, and directed an ignited stream of this mixture on the edges of two pieces of lead brought together, and found they were very neatly and expeditiously fused into one. He tried the same mixture on two pieces of copper, but found this combination of the gases not intense enough to fuse the edges together; but, at the same time, had no doubt but a well-regulated mixture would answer the desired object: and in this case, of course, oxygen would have to be added. Speaking of the French process, Mr. Spencer says "there is a slight difference in the method employed by M. Reichmond—it being, as far as I have seen, only applicable to fuse together the edges of lead—it being a mixture of hydrogen and atmospheric air only. To fuse together the harder metals will, I apprehend, require the adoption of my method of applying a greater amount of artificially acquired oxygen."

## STATISTICAL SOCIETY.

WORONZOW GREIG, Esq. in the chair.—Fellows were elected.—Read, 'Report of the Working of the Registration and Marriage Acts during the two Years, 1837-8 and 1838-9, in the Registration District of Manchester,' by William Johns, M.D. Superintendent-Registrar. In the returns made by parliament, Manchester is included in a division embracing several adjoining districts, among which is the contiguous town of Salford, with about twenty other hamlets or chapelrys, covering a space of 37,797 acres, and containing a population of 236,933. The number of births registered during the first year was 5458 (2792 males, 2666 females); and during the second year, 6358 (3303 males, 3055 females); being an increase of 900 on the former year. The proportion of males to females is as 51:582 to 48:418, giving an excess of male births 3:164, or rather more than 3½ per cent. During the two years, in 11,816 births there was one case only of triplets, and 127 of twins. The twins are in the ratio of 1:0748 in every hundred. Cuvier estimated the average of twin births at two in 1500. The registered deaths during the first year were 5611, and in the second year 6234; being an increase of 623. The males in the two years amounted to 6174, females to 5671. The proportion of males to females is as 52:123 to 47:877, being an excess of 4:246, or nearly 4½ per cent; the excess of male over female births is 3:164, or 3½ per cent, as has been stated: so that, although within a given period there are more males than females born, within the same period there is a greater proportion of male deaths than of female births. In the Manchester district the excess of male deaths above male births is 1:082 in every hundred. We pass over the comparative deficiency in the number of births registered; coroners' inquests about 4½ in every hundred deaths; deaths in public institutions; diseases; and suchlike details, being chiefly of local interest, and come to that part of the memoir referring to marks and signatures in the registers as indicating the state of education. These shew a difference in the class of persons signing the registry of births from those signing the registry of deaths; in the former case the marks

are in excess 22-32, in the latter case 18-14—a difference of about 2 per cent, owing, most likely, to the more frequent registry of births by the mothers, and shewing that these are less able to write. Uniting the births and deaths, the signatures are to marks as 39-8 to 60-2, exhibiting a lamentable deficiency in the state of public education, when only 40 persons in 100 are found capable of attesting some of the most important events in civil society! In the state of education in the different districts there is a yet more marked difference. In Ancoats the proportion of signatures is only 26 per cent, or nearly three out of four persons incapable of writing! In London Road, 34; in St. George's, 43; in Deansgate, 44; and in Market Street, nearly 60. It is not easy to explain these discrepancies. It is a fact worthy of notice, that the signatures in attestation of the solemnisation of marriages exceed the attestations by marks; the difference is 10 per cent in favour of signatures. These facts would lead to the inference that the parties forming marriages are generally a better instructed and higher class than the average of the population, or that they are usually at a time of life when the effects of an early education have not been erased by disease and neglect. Some conversation followed the reading of the paper.

#### INSTITUTE OF BRITISH ARCHITECTS.

APRIL 27th. The Marquess of Northampton in the chair.—Signor Gasparo Fossati, architect to the Emperor of all the Russias, was elected a corresponding member. The Duke di Serradifalco acknowledged his election.—Signor Bolasato and Herr Carl Tottie presented donations.—Mr. Fowler exhibited some remains of Roman work recently discovered in the City.—An essay was read by Mr. George Alexander 'On the Classification of Egyptian Architecture.' The writer endeavoured, by some of the existing buildings, the dates of which are known, to apportion particular styles, or peculiarities of design, to particular dynasties.—Mr. Donaldson, Mr. Hamilton, and Sir Gardner Wilkinson, bore part in a long conversation on the subject.—Mr. Godwin, jun. read a paper 'On the Origin of the Vertical Line in the Buildings of Ancient Rome, and the Return to the Use of the Horizontal Line exhibited in the Palazzi of Modern Italy.'

#### PARIS LETTER.

Academy of Sciences, May 10, 1840.

MAY 11.—The proceedings commenced by the election of a president for the remainder of the year, in the room of M. Poisson; and the choice of the Academy fell almost unanimously on M. Poncelet. M. Bessel, Director of the Observatory of Königsberg, was elected foreign corresponding member.

M. Puissant presented the second volume of his "Description Géométrique de la France," composed by him from the memoirs of the engineers whose surveys he directed. M. de Blainville read a long report on a supplementary memoir by M. Foville, on the structure of the brain.—A letter was read from M. Leone Pilla, the learned Italian geologist, to M. Elie de Beaumont, in which he declared that he renounced his opposition to the theory of craters of elevation, in consequence of his having examined the extinct volcano of Bocca-monfina. Here there was a vast circular crater greatly truncated, and surrounded by parasitic cones, in the midst of the Apennines. In the middle of this crater was a plain, and in the midst of this again, a conical or dome-shaped

hill, upon which was the village that gave its name to the volcano. In the great outer crater there were no currents of lava, nor any of the characteristics of craters now in activity. He considered it to be a true crater of elevation.—M. Fontan, who has already published the result of his examination of the mineral waters of the Pyrenees, has lately been visiting Germany, Belgium, Switzerland, and Savoy: he now addressed to the Academy the observations he had made on the mineral waters of those countries. With regard to the sulphureous waters, he inferred that the causes of their being sulphureous were accidental, and arose from the disoxygenation of a sulphate, commonly of calcium or magnesia, sometimes of soda, by means of organic matters in a state of decomposition; and that all the sulphureous springs he had examined were from four to five times weaker than those of the Pyrenees, the waters of Scheinach excepted.—M. Rivière addressed a memoir to the Academy on the strata of the palæotheric group of La Vendée, forming part of his general description of the geological structure of that part of France. He shewed in it that this group is represented in La Vendée by nothing more than slips of the miocene period, and of the eocene, such as at the Grande Cheverière and La Gariopière, for the former; and at the island of Noirmoutiers, at Bouin, and Sallairtaine, for the other. There are no igneous rocks in La Vendée to account for the upheaving of the palæotheric formation; but those of the eocene period were observed to accord in their general inclination with those of the island of Corsica, viz. from north to south; while those of the miocene period agreed with the Western Alps, and dip towards S.S.W.—Count Demidoff communicated a note on the temperature of the Crimea, and other adjacent parts of Russia. The mean temperature for the last fourteen years had been 9° 34' of the centigrade scale.—Some improvements in the fixing of photographic impressions was communicated by M. Choiselet.

At a former sitting, a memoir was read from M. Baudremont, on the application of the specific heat of bodies to the determination of their atomic weight, in which the author declared his conviction that the method of cooling, to determine caloric capacity, was not applicable except to a certain number of bodies. He conceived, also, that the elementary substances are not composed of atoms placed in immediate juxtaposition, but of divisible molecules.

M. Regnault read an elaborate memoir on the specific heat of simple substances. He commenced by an historical review of the labours already expended upon this subject, and dwelt much upon the law discovered by Dulong and Petit,—a law which was now doubtful, on account of the anomalies found when the atomic weights, badly determined at the time of their experiments, were related by the real weights of bodies. As for the method of cooling, he considered it decidedly faulty. A description was then given of the experiments and apparatus, and the numbers found for the specific heats were tabularised. In one part of the table were the substances which M. Regnault had obtained perfectly pure, and of which the specific heats might be considered as having been determined exactly: these were the metals where the substances were quite free from the admixture of other substances. Most of these metals were slightly carburetted, and their specific heat was therefore represented greater than it ought to be. However, to obtain an approximation to their heat when in a state of purity, he had deter-

mined the specific heat of iron, for example, in different states of carburation; viz. in that of steel, of fine metal, and of white metal. A similar method had been tried with most of the other metals. M. Regnault then explained several differences of numbers, as determined by himself, compared with those of Messrs. Dulong and Petit: he conceived that they had valued the atomic weights of the substances too highly. He himself had not, in all cases, adopted the atomic weights as determined by M. Berzelius: thus, he had taken the atomic weight of silver at just one half of what that illustrious chemist had done; while, on the other hand, he had made the number for bismuth 1330, instead of 887. The law of specific heat being once determined for certain substances, their atomic weights became much more easy to be fixed and corrected. Thus the atomic weight of uranium hitherto adopted was 2711, but according to the specific heat of that substance it ought to be reduced to 677.84; and the oxide of uranium, hitherto considered as a protoxide, became expressed by the formula  $U^2O$ . The atomic weight of carbon, as hitherto determined by Berzelius, had to be doubled; and this circumstance gave the following formulae:—

Oxide of Carbon .....	$CO^2$
Oxalic acid .....	$CO^2$
Carbonic acid .....	$CO^1$

The neutral carbonates became subcarbonates, and the bicarbonates, neutral ones.

Academy of Inscriptions and Belles Lettres. Sitting of May 8th.—M. G. Burnouf communicated numerous extracts of the Introduction to his translation of the "Bhagavata Purana," of which the three first books, with the Introduction, were printed early in February of this year, at the Imprimerie Royale, and which is shortly to appear by order of government. Setting out from the documents collected by Messrs. Colebrooke and Wilson, M. Burnouf endeavoured to prove that the Puranas contain an ancient portion of the cosmogonical and epic traditions of India; that these traditions have been successively modified by a spirit of sectarianism, and that they have assumed under this influence, which is comparatively modern, the form which they now possess. Several questions, relative to the originality and the antiquity of the sacred literature of India, are examined in this long and learned introduction of M. Burnouf, with all the skill and acumen for which he is so well known. In this introduction there are also contained some curious discussions on the Brahminical writings, especially on the "Bhagavata Purana."

M. d'Armandy communicated an essay on the methods adopted by the ancients for training elephants for battle, and on the effect which these enormous animals must have produced in the field.

Academy of Moral and Political Sciences.—Sitting of the 9th of May. M. Villermé reported that the committee for adjudicating the quinquennial prize of 5000 francs, founded by Baron Félix de Beaujour, for the best memoir on the means of relieving the misery of the poorer classes, especially in France, had not thought any of the memoirs sent in sufficiently good. Extracts from the three best were read: the observations contained in them turned much on the state of the poor in England and Ireland, the workhouse system, &c. The prize was declared to be still open for 1840.

Sitting of the 16th of May.—An animated discussion arose at this sitting between Messrs. Dupin and Dunoyer on the one side, and

Messrs. Passy and Blanqui on the other, as to the injury done to agricultural populations by the increase of manufactures and manufacturing populations. The former gentlemen complained of labourers being withdrawn from agricultural operations by the temptation of higher wages in towns. M. Blanqui replied that, if the agriculturist produced, and wished to sell, he must have a buyer, such as he could only find in the manufacturer. He quoted the examples of Sicily and Poland, two agricultural countries of great fertility, but no manufactures, and where the peasantry were very miserable. M. Passy said, the evil complained of could not be remedied: it attested the progress of riches of all kinds. As agriculture improved it stood in need of improved manufactures, and their joint advancement was inevitable.

*Academy of Inscriptions and Belle Lettres.*—M. Sedillot read a memoir showing that the Arabian astronomer, Aboul Wefa, had determined the third inequality or variation of the moon, 600 years before Tycho Brahe, to whom the honour of this discovery has always been attributed. M. Sedillot supported his views on the authority of a passage in the Arabic MS., No. 1138, Bibl. Roy., several of the leaves of which bear the impression of a seal which proves the antiquity of the document. The legend of this seal is to the following effect:—*Ex thesauro librorum Sultani supremi Schah Rokh Behadur.* Two coins of the Sultan Schah, son of Tamerlane, for the discovery of which M. Sedillot professed himself indebted to M. Reinand, had given him the power of shewing their perfect identity with the seal in question. This gentleman also gave a notice of the various coins which are known of the Timourides of Transoxiana, in which he pointed out several blanks in this branch of the numismatic history of the East.

*Académie Française.*—This body has just awarded the two Gobert prizes for the best works on the history of France. The first, an annual rental of 9000 francs, has been given to M. Augustin Thierry for his new work, "Résumé Mérovingiens précédés de Considérations sur l'Histoire de France;" and the second, a rental of 1000 francs, to M. Bazin, for his "History of Louis XIII." According to the terms of the bequest of M. Gobert, these rentals are to be held by those gentlemen until other works shall be produced by fresh competitors, and which may be judged by the Academy superior in merit to those for which the prizes have just been awarded. The Academy is bound to make an annual examination to this effect; but the task must be an extremely invidious one.

The *Société de l'Histoire de France* held its general annual assembly on the 11th of May. After the usual business and election of officers, M. Leroux de Lincy read a learned notice on the ancient poem or romance, "La Conquête de Jérusalem;" and M. Guadel, on a fortified town of the Bordelais, during the religious wars of the sixteenth century.

The *Pontificia Academia Romana de Archeologia* celebrated on the 20th of April the anniversary of the foundation of Rome. All the classes of the Academy were assembled in the Giustiniani palace, and Monsignore Cadolini, archbishop of Edessa, pronounced a long and eloquent discourse.

The Emperor of Austria has appointed Count Renato Borromeo director of the Conservatory of Milan.—M. Brochant de Villiers, Inspector-General of Mines, and Member of the Academy of Sciences, died on the 16th of

May at Paris.—M. Planché, member of the Royal Academy of Medicine, and a very distinguished chemist, died a few days since.

We learn from Rome that a new and complete edition of all the Fathers is about to be commenced there, under the direction of Signor Castelli.—A Cabinet Encyclopædia is coming out in Paris on the same plan as that of London, many of the volumes being translations of such works as Herschel's, Kater's, &c.—Two very first-rate books of totally opposite kinds, and both equally valuable to the ladies, have just appeared. One is by Dr. Moreau, the first accoucheur in Europe, and it embodies the results of his practice, under the title of "Traité pratique des Accouchements:" it has produced a *grande sensation* in the medical world. The other work is that honest and excellent fellow Lablache's "Méthode complète de Chant," with a great number of exercises in it: this work forms a handsome folio, and is written with all the command of his subject, for which every body will give the *greatest* singer in the world full credit.—There is a series of *politico-economical* tracts coming out, something in the way of Miss Martineau's: they are entitled "Entretiens du Bonhomme Mathieu." Their author is M. Bonnaire, and the first number is on Commerce.—Madame Flora Tristan, the novelist, who was attempted to be murdered by her husband eighteen months ago, has written a work called "Promenades dans Londres," a sort of romantic and sentimental journey through the British metropolis.

#### Enigma.

Grande ho la bocca, e morde senza denti,  
E ognun m'adopra con le proprie mani.  
Son uno eppur son due, e in due soventi  
Quel ch'è uno è diviso, e faccio in brani.  
L'arte mi fece gli occhi a' piedi uniti,  
E spesso agli occhi mi ritrovò i diti.

Answer to the last sciarada:—Ino-pia.

### LITERARY AND LEARNED.

#### UNIVERSITY INTELLIGENCE.

OXFORD, April 30.—The following degrees were conferred:—

*Bachelor in Civil Law.*—Hon. and Rev. H. W. Bertie, Fellow of All Souls' College.

*Masters of Arts.*—Rev. F. T. New, St. John's College, Grand Compounder; E. B. Smith, Michel Fellow of Queen's College and Vinerian Scholar; Rev. J. Saunders, Rev. H. Moule, Queen's College; Rev. R. H. B. Lee, Lincoln College; T. H. Sheppard, E. A. Litton, Fellows of Oriel College.

May 14.—In Convocation, A. H. Haliburton, Esq. M.A. of St. John's College, Cambridge, and the Rev. W. C. Gibbs, M.A. of Trinity College, Dublin, were admitted *ad eundem*.

In a Congregation the same day the following degrees were conferred:—

*Bachelor in Divinity.*—Rev. R. Briscoe, Fellow of Jesus College.

*Masters of Arts.*—E. D. Tinkling, J. E. Bode, W. E. Pole, Students; Rev. E. M. Gore, Christ Church; S. E. Bathurst, Fellow; Rev. W. F. H. Knolls, Merton College; Rev. W. C. Hayward, Oriel College; Rev. G. Robinson, Balliol College; Rev. H. H. Brown, Corpus Christi College.

*Bachelors of Arts.*—C. Barton, Wadham College, Grand Compounder; G. Braithwaite, Grand Compounder; S. Lee, G. W. Cockere, C. J. Penny, Queens' College; H. W. Acland, Christ Church; D. J. Cothor, W. Pedder, M. T. Latham, G. Antrobus, T. A. Kershaw, Brasenose College; J. Compton, Merton College; H. Cobbe, H. Bowles, J. Bearcroft, G. Coryton, Oriel College; C. R. Davy, Balliol College; C. H. Browne, J. W. Davis, Worcester College; G. F. Master, University College; T. H. Britton, F. Courtenay, C. F. Baker, Exeter College; Rev. J. Irvin, G. Queen's College, incorporated from Trinity College, Dublin.

#### ROYAL ASIATIC SOCIETY.

THIS Society held its Seventeenth Anniversary on the 9th. The Right Hon. C. W. Williams Wynn, President, in the chair.—The annual Report of the Council was read, commencing with the ordinary financial statements and details of deaths, resignations, and new elections. The members whose deaths were particularly mentioned were—Runjeet Singh;

General Allard; Professor Bohlen; Canelly Venkata Lutchmiah, a native of Madras, whose knowledge of languages, both Asiatic and English, has been applied by him to literary research to an extent very uncommon among Hindoos. The report also contained a most interesting memoir of James Prinsep, Esq., whose extraordinary attainments in so many, and apparently incompatible branches of knowledge, have been subjects of wonder and admiration to the scholars of Europe, but whose indefatigable zeal and unremitting labours had exhausted his powers at the early age of forty, while he was in the pursuit of those discoveries in Eastern antiquities, to which he had himself opened the way by his penetration in deciphering and reading inscriptions which had hitherto baffled all inquiries. Allusion was then made to the important discoveries made in Persia by Major Rawlinson, whose researches have already been noticed in our pages, and who has promised to send the Society the full results of his labours for publication. The successful progress of the labours of the Oriental Translation Committee was stated; and a detail was given of the valuable works now in course of printing and translation under the auspices of that distinguished body. The Right Hon. Sir Alexander Johnston, as chairman of the Committee of Correspondence, detailed the various matters that had engaged the attention of the Committee during the past year, which had for their object to procure information as to the moral and political changes which were going on in Turkey, Central Asia, India, and China. He also remarked on the gradual increase of interest which the public in England are acquiring on Asiatic matters, which are no longer avoided as though England had no sort of connexion with the Eastern world. It was understood that the right honourable gentleman would commit the substance of his interesting Report to writing, for the purpose of its being printed in the "Journal" of the Society. The report of the Committee of Commerce and Agriculture was then read by Colonel Sykes, and contained a summary of the principal operations of that body during the year. One of the subjects alluded to was the cultivation of cotton in India, on which they had printed valuable papers, by General Briggs, Dr. Lush, and Mr. Heath. This subject was undergoing investigation, and the result of an analysis of various cotton soils from different parts of Europe, Asia, and America, by Mr. Solly, would be published shortly. Papers on the production of sugar and cocoa-nut oil in Ceylon, on the improvement of Indian wool, on the wool of the Angora goat, on opium, safflower, silk, Indian tea, caoutchouc, &c., had been read before the Society. Some of them had been printed, and the rest would appear in due course. The thanks of the Society having been voted to the Council for their services, the right honourable the President rose to acknowledge it. He said that the Report just submitted from the Council met with his entire concurrence; and, although some might complain that their finances would not allow every thing to be done that could be wished, he saw no reason for despair. An interest had been aroused in England towards India which could not but produce the best results; and the recent advance of steam-navigation, which had brought a voyage to India within the time formerly occupied by a tour to Russia or the Mediterranean, would increase that interest. He then alluded to the extraordinary discoveries of Major Rawlinson; and thought that more would be done to make the literary world

aware of the value of the Society by the publication of such treasures in its "Journal" than could be done by any individual canvass. The right honourable the President then remarked on the progress of tea cultivation in India; and on the merits, generally, of the gentlemen in the East India Company's service, both civil and military, and said that they well deserved the encomium bestowed on them by Canning, of uniting the wisdom of statesmen with the research of scholars. Sir George Staunton proposed a vote of thanks to the President, whose exertions in favour of the Society were not dampened by illness or infirmity. It was not the President's fault, certainly, if the endeavours made to obtain assistance from government had failed; nor would he (Sir George) stop to inquire why the expression of the interest felt by her majesty in the success of the institution had produced no results. But he was at least happy that they had been able to do so much without patronage; and he looked forward with confidence to a time when they should be able to do more. He then mentioned the paper on the commerce of China, by Mr. Ball, whose long residence in the country, and knowledge of Chinese affairs, gave an interest to his lucubrations which could be given only by a person who had been in, and had profited by, his situation. He thought the publication of the paper was, at this critical moment, most opportune, and would be a valuable guide in the formation of opinions on the matter at issue between us and the Celestial Empire. After the discussion of certain financial matters, and making a verbal alteration in one of the Society's regulations, the meeting proceeded to ballot for the council and officers for the ensuing year. The following gentlemen were elected into the Council in the room of those going out by rotation:—Sir Jeremiah Bryant, C.B.; Sir Charles Forbes, Bart.; J. M. Heath, Esq.; Sir Richard Jenkins, G.C.B. M.P.; Sir James L. Lushington, G.C.B.; the Rev. W. H. Mill, D.D.; William Newnham, Esq.; and Henry Wilkinson, Esq. All the officers of the preceding year were re-elected.

## SOCIETY OF ANTIQUARIES.

THE Earl of Aberdeen, President, in the chair.—H.R.H. Prince Albert honoured the Society with his presence, and inscribed his name in their book as one of the Fellows of the Society.—Mr. Gage Rokewode communicated an account of the final examination of the barrows on the Bartlow Hills, Essex; of the former excavations and discoveries at which place highly interesting accounts have, from time to time, been communicated by Mr. Rokewode to the Society, and printed in the "Archæologia." The results of the examination of the last barrow, where a further collection of Roman sepulchral remains, consisting of a large square glass jug, containing burnt human bones; a vessel of white glass (apparently a drinking glass), similar in shape to an apothecary's graduated measure; a beautifully formed bronze prefericulum and dish; a bronze lamp, cup, and patema of Samian ware, and several vases of baked clay, of various sizes and forms, most of which are in a remarkable state of preservation. The Prince examined these curious relics with much apparent interest.

## LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Linnean (Anniversary), 1 P.M.; Geographical (Anniversary), 1 P.M.; Medical, 8 P.M.  
*Tuesday*.—Medical and Chirurgical, 8 P.M.; Civil Engineers, 8 P.M.; Zoological, 8 P.M.; Royal Botanic, 8 P.M.

*Wednesday*.—Society of Arts, 7 P.M.; Geological, 8 P.M.; Medico-Botanical, 8 P.M.  
*Thursday*.—Royal, 8 P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Numismatic, 7 P.M.  
*Friday*.—Royal Institution, 8 P.M.;

## FINE ARTS.

## PHOTOGENIC ART: ENGRAVING.

THIS paper will be read with deep interest by every man of science and artist. It is the FIRST GRAND USEFUL STEP in advance upon the New Invention, and portends such a revolution in many processes (particularly Engraving) now commonly carried on by other means, as to be of universal importance. We rejoice in making the *Literary Gazette* the medium of communicating it to the British public.—*Ed. L. G.*

*Discovery of a method of permanently fixing, engraving, and printing from Daguerriotypy, by Dr. Berres. Paper communicated to the Imperial Society of Physicians of Vienna, at the meeting of the 30th of April, by Dr. Berres, Professor of Anatomy in the University of Vienna, relative to the discovery by him of a method of fixing the impressions produced by Daguerriotypy, by means of which these productions can be employed instead of engraved plates, and copies therefrom printed, as in the case of the ordinary copperplates, &c.*

It was announced in the "Vienna Gazette" of the 18th of April last, that I had succeeded in discovering a method by which I was enabled both permanently to fix the pictures produced by the process of Daguerre, and to render them available to all the purposes of etchings upon copper, steel, &c., from which copies might be struck off to any extent, as in the case of ordinary engravings; and it was stated in the same newspaper, that I proposed to bring my discovery immediately before the public. As a member of this distinguished Society, I consider it my duty, in the first instance, to describe to this learned body a discovery which excites so much hope, and which promises so great a benefit to the arts and sciences, as a product of the progress of modern invention in this country, and in your presence to make it for the first time publicly known, and to call upon you to acknowledge truth and successful accomplishment.

The well-known great expenses, and innumerable difficulties attendant upon the publication of an extensive work requiring engravings as illustrations, led me, in the first instance, to the hope, that through the discovery of Daguerre upon iodined silver plates, I might be able to render it available by improvements, to represent and fix thereupon the objects necessary to my wants; and the first view of a heliographic picture aroused in me the desire also to represent microscopic objects in the same manner, and to be able to collect them, although earlier attempts with the strongest lamplight to produce engravings or etchings had been unsuccessful. For a while, the idea was nearly abandoned as hopeless, until, a short time since, it was revived by the sight of the extraordinarily powerful hydro-oxygen gas microscope of Mr. Schute, of Berlin, an instrument which, in its power and clearness, has never before been equalled or even approached.

Upon the 27th of February last, I had the honour of laying before this learned body the result of the united investigation of my distinguished colleague, Professor de Ettingshausen and myself, upon this subject, and the perfectly successful experiments with pictures prepared through the process of photography upon microscopic objects. Many specimens of the

\* Alluding to his magnificent work upon microscopic anatomy.—*Translator's note.*

results of our researches and successful attempts in this country, in the employment of photography, in scientific and useful purposes, are now placed before you for your examination and approval.\*

Through this new method the use of daguerriotypy is rendered considerably more extensive and available for scientific purposes. Every object which is discernible to the eye with clearness, can for the future, through the means of the iodined silver plates, be minutely etched; and, true to Nature (for she is herself the best artist!), be copied with the minutest exactness and beauty.

The astonishingly beautiful representations, which we are enabled to produce through the means of daguerriotypy, are liable to so many injuries, and are so delicate, fragile, and evanescent, that they never can be rendered available for illustrating works of science and other useful purposes.

The deep impression which these productions made upon my mind, although mingled with a knowledge of their fragility, seemed to reproach us for incapacity, in not rendering so great an invention of genius both durable and useful.

In the Petersburg newspaper of March last, I observed the first intelligence of some partially successful attempts to bring daguerriotypy into general use. In the meantime, M. Daguerre had declared before the Institute of Paris the complete failure of all his hopes of succeeding by means of etching, in retaining the impression upon even a single copy; and, in truth, it appears that in Paris all their exertions are limited to producing imitations of daguerriotypy.

The experiments at Petersburg, and the hope of eventually succeeding, urged me to the attempt of using the daguerriotypic prints otherwise than as copies, and I began at the commencement of this month my series of experiments.

Without recapitulating all my unsuccessful attempts, in which I was assisted by the truly obliging and extraordinary readiness of Mr. Francis Kratochvila (a gentleman in the employ of government), and of Mr. Schute, who placed at my disposal an immense number of daguerriotypic specimens; and before I come to the subject-matter of this communication,—i. e. the process of rendering permanent and capable of employment the daguerriotypic prints,—I consider it proper to lay before you the following observations:—

1. The necessary copperplates, as they are used at present in the daguerriotypic plan, can effect only the permanently fixing, never the etching and printing, of copies therefrom.
2. In the heliographic etchings, it is necessary that the picture be produced with the requisite intensity upon pure chemical silver plates.
3. The etching of the daguerriotypic picture is produced through the influence of nitric acid, to be explained hereafter.
4. For the permanent fixing of the daguerriotypic picture, a galvanic power is necessary.
5. For the changing of the daguerriotypic picture into a deep metal etching, so as to be used as a means of printing, the chemical process of etching is finally of itself sufficient.

My newly discovered method of managing

\* My friend Dr. Mackenzie has undertaken to convey the specimens exhibited to the Society and many others to London, in the commencement of June, a portion to be placed by him at the disposal of a learned society, and the remainder to be retained for the examination of his scientific friends and the public interested in the progress of science. [Our friends will, we trust, also have an opportunity of seeing specimens in our possession.]—*Ed. L. G.*

the daguerreotypic productions may be divided into two proceedings.

1. That of permanently fixing the design.

2. The changing the design, when once permanently fixed, into an etching upon the plate. The method of permanently fixing the daguerreotypic design, with a transparent metal coating, consists in the following process:—

I take the designs produced in the usual manner by the daguerreotypic process, hold them for some minutes over a moderately warmed nitric acid vapour, or steam, and then lay them in nitric acid of 13° or 14° (Réaumur), in which a considerable quantity of copper or silver, or both together, has been previously dissolved. Shortly after being placed therein, a precipitate of metal is formed, and can now be changed to what degree of intensity I desire. Now I take the heliographic picture, coated with metal, place it in water, clean it, dry it, polish it with chalk or magnesia, and a dry cloth or soft leather. After this proceeding the coating will become clean, clear, and transparent, so that the picture can again, with all its properties, be easily seen.

The greatest care and attention are required in preparing the daguerreotypic impressions intended to be printed from. The picture must be carefully freed from iodine, and prepared upon a plate of the most chemically pure silver.

That the production of this picture should be certain of succeeding, according to the experiments of Mr. Kratochwill, it is necessary to unite a silver with a copper plate; while, upon other occasions, without being able to explain the reasons, deep etchings or impressions are produced, without the assistance of the copper plate, upon pure silver plate.

The plate has now to be varnished upon the spot where the acid ought not to have dropped. Next, after being held for one or two minutes over a weak warm vapour or steam, of 25° to 30° (Réaumur) of nitric acid, there must be poured over it a solution of gum Arabic, of the consistence of honey, and it must be placed in a horizontal position, with the impression uppermost, for some minutes. Then I plunge the plate, by means of a kind of double pincette, whose ends are protected by a coating of asphalt, or hard wood, in nitric acid, at 12° or 13° (Réaumur). Let the coating of gum slowly melt off, or disappear, and commence now to add, though carefully and gradually, and at a distance from the picture, a solution of nitric acid, of from 25° to 30°, for the purpose of deepening or increasing the etching power of the solution. After the acid has arrived at 16° to 17° (Réaumur), and gives off a peculiarly biting vapour, which powerfully affects the sense of smelling, the metal becomes softened; and then, generally at this point, the process commences of changing the shadow upon the plate into a deep engraving or etching. This is the decisive moment, and upon it must be bestowed the deepest attention. The best method of proving if the acid be strong enough is to apply a drop from that in which the plate now lies to another plate: if the acid make no impression, it is of course necessary to continue adding nitric acid; if, however, it corrode too deeply, then it is necessary to add water, the acid being too strong. The greatest care must be bestowed upon this process. If the potency of the acid have been carried too far, a fermentation and white froth will cover the whole picture, and thus not alone the surface of the picture, but also the whole surface of the plate will quickly be corroded.

When, by a proper strength of the etching powers of the acid, a soft and expressive out-

line of the picture shall be produced, then may we hope to finish the undertaking favourably. We have now only to guard against an ill-measured division of the acid, and the avoidance of a precipitate.—To attain this end, I frequently lift the plate out of the fluid, taking care that the etching power shall be induced to whatever part it may work the least; and seek to avoid the bubbles and precipitate by a gentle movement of the acid.

In this manner the process can be continually applied to the proper points of strength and clearness of etching required upon the plates, from which it is proposed to print.

I believe that a man of talent, who might be intrusted with this art of etching, and who had acquired a certain degree of dexterity in preparing for it, would very soon arrive at the greatest clearness and perfection, and from my experience, I consider, would soon be able to simplify the whole process. I have tried very often to omit the steaming and the gum Arabic, but the result was not satisfactory, or the picture, very soon after, was entirely destroyed; so that I was compelled again to have recourse to them.

The task which I have undertaken is now fully performed by placing in the hand of this learned body my method of etching and printing from the daguerreotypic prints, which information being united to the knowledge and mechanical experience we already possess, and published to the world, may open a road to extensive improvements in the arts and sciences.

By thus laying open my system to the scientific world, I hope to prove my devotion to the arts and sciences, which can end only with my life.

#### ROYAL ACADEMY.

[Third notice.]

120. *Horses taken in to Bail.* The property of J. Marshall, Esq. Edwin Landseer, R.A.—The horse and the portrait, like all which comes from the pencil of this admirable artist, are distinguished for character and beauty. The figures introduced are in the Flemish costume, and so decidedly does the picture resemble a Cuyp, that, for our own part, the possession of it would give us as much pleasure as that of most of the works which we have seen by that justly esteemed painter.

116. *Fair Time.* W. Mulready, R.A.—This painting, also, in style and execution, much resembles some of the best productions of Flemish art, and, like the Dutch fairs, it has a feature not less common to them than to those of our own country; for an intoxicated young peasant stands at the door of a cottage, to the great annoyance of its sober and grave inmates. In the foreground, a group of boys are extorting pence from a good-natured countryman to spend at the fair. As in "The Wolf and the Lamb" of former celebrity, there is a covert meaning in this, as in many other of this able artist's works.

72. *Scene from the Gentle Shepherd.* A. Johnston.—A very pretty pastoral subject, but it is love in a mist, for the atmosphere is very hazy; as early dawn is alluded to in the quotation, this is "quite correct," especially in "the north country."

87. *The Wedding Ring.* N. J. Crowley.—The subject is well treated, and we will add, with reference to the fair damsel about to receive the pledge, that her intended has well chosen. As a work of art, the execution is able and the effect brilliant.

69. *Fruit.* A. J. Oliver, A.—We could not

wish the couple just noticed a better dessert after their wedding-dinner than that displayed in this well-managed and varied composition.

252. *The Irish Whisky-Still.* Sir D. Wilkie, R.A.—There is no performance, whether as a subject or as a work of art, of more general interest, than this miscellaneously filled picture, by Sir D. Wilkie; but if, instead of human beings, from infancy to old age, employed in the production of this fascinating poison, he had introduced imps and demons, such as we find in S. Biard's "Slave-trade," they would have been more appropriate to the scene and its consequences.

361. *A Mother's Love.* G. Clint.—The sentiment in the lines quoted is beautiful, and it is beautifully illustrated by the pencil of the artist.

334. *The Wonderful Cure by Paracelsus.* R. Redgrave.—Would that there were such physicians nowadays! The subject is made interesting by the skill of the artist, it owes little to the occasion which gave rise to it. The work has all the appearance of the representation of a grand historical event, without any thing to support the character of one.

287. *The Monarchy in the Fourteenth Century, Boar-Hunters Refreshed, &c.* J. R. Herbert.—The same may, perhaps, be said of this clever composition, but it belongs to an age which the present generation is fond of contemplating, and in the hunters' hall of a country sportsman's residence would be quite in place. The merit of the performance would be welcome any where.

487. *The Lay of the Last Minstrel.* W. D. Kennedy.—The portrait of the late Sir Walter Scott is introduced as the minstrel. With a great deal of talent displayed, both in character and in execution, we think the composition rather overlaid; fewer figures and more simplicity would have given greater dignity to the scene.

61. *The Salutation of the Aged Friar.* C. L. Eastlake, R.A.—A picture of purity, both in sentiment and in colour. The paternal and affectionate character of the old father, and the value and favour of his benediction, are evinced by the grateful and devout manner in which the latter is received by a group of young and beautiful females. Great breadth is preserved in the composition, without any violent contrast in either tone or hue.

256. *The Passing Welcome: Naples.* W. Collins, R.A.—The passing welcome is seen in a group of females on an elevated, vine-clad terrace, bestowing a bunch of delicious grapes on a traveller who has halted below to receive the gift; but whether this is a general custom, or a particular favour, we are left to guess. Not so of the sunlit and brilliantly coloured character of this beautiful picturesque composition.

Of a similar and no less lively description are 89, *A Neapolitan Boy decorating the Head of his Innamorata at the Festa of the Madonna del Arco*; and 92, *The Loggia of a Vinc Dresser's Cottage in the Afternoon of a Saint's Day.* T. Uwins, R.A.—Love and the dance are too pleasing accessories in the performance of religious duties not to be duly appreciated by youthful votaries of either sex.

[To be continued.]

MR. LILLEY'S PORTRAIT OF LIEUTENANT-GENERAL LORD BLOOMFIELD.

This fine whole-length is now on view at Messrs. Colnaghi and Puckle's, preparatory to its being sent to the engraver's. It is a striking resemblance of the distinguished nobleman

in question. The figure is admirably drawn, and has an air of manly dignity and simplicity that is very imposing. Perhaps if some portions of the contour were more lost in the background, the effect would be improved. We were much pleased with the masterly manner in which Mr. Lilley has treated the gold-lace, and the insignia of the Order of the Bath.

#### ORIGINAL POETRY.

##### LINES ON THE LITTLE POSTAGE-STAMP PICTURE OF OUR DEAR LITTLE QUEEN.

Oh! our sweet little Queen! What beauties adorn her;  
Though but funny she looks there, stuck up in the corner;  
None can doubt, who have eyes, even Radicals mulish,  
She's a penny-wise Queen, not a Sovereign foolish.

Mulready may boast of his flourishing figures,  
His Chinese, William Penns, naked ladies, and niggers,  
Here's a head worth them all, and at as little cost  
We've the head of the nation, a head for the Post.

Just plaster it on, or in black, or in blue,  
And your mislives will travel free all the land through;  
To stop them who dared would be lagged for a scamp,  
One who'd venture to say that she's not the right stamp.

And 'tis proper and right, for though jesters may scoff,  
Like sharp critics at plays, and cry Off, off, off, off,  
She's been bred in a school where folks learn to stick  
faster plaster.

Than any where else,—thence the statesmen's court  
For a penny address we apply to the crown,  
And it knocks your pre-postorous pre-paying quite down,  
As with feelings most loyal to the office you range,  
Pop your Queen-letter in and never seek change.

Dear bust of our Graciously, to Albert allotted,  
One to literature, science, and fine arts devoted;  
For his sake who holds you in sweet nuptial fetters,  
Stick to him, to your post, and to all men of Letters.  
And, loved Queen, in return, We, all faithful and true,  
Should rebellion ere point its foul finger at you,  
Or Chartism's surges against your throne dash,  
Will stick fast and back you like glutinous wash.

TRUTHA.

#### THE DRAMA.

*Covent Garden* (as we noticed three weeks ago) shuts after Friday next, when C. Mathews takes a benefit—no doubt, a bumper one. The shortening of the season speaks of but moderate success.

At the *Haymarket*, to-night, a new tragedy of a domestic character, and founded on that deep and damned blot, the massacre of Glencoe, is announced for a first representation, with Macready and all the strength of the house.

Thursday, at the *German Theatre*, *Faust* was produced in a miserable style, and with the exception of a chorus or two, the music was ineffective and wearisome. The same night being advertised as Lablache's benefit,—a trap to strangers who know no better,—*Her Majesty's Theatre* was well filled for *Don Juan*, and the performances went off pleasantly in this never-tiring opera.

*Quartet Concerts*.—The last of these attractive concerts was given on Monday night, the programme was even more than usually promising, and the room as full as it has previously been. Although concerts are now plentiful as blackberries, the audience were gratified by hearing Haydn's quartet in E flat major, and Beethoven's quartet in C minor, perfectly performed. A manuscript trio for pianoforte, violin, and violoncello, was beautifully played by Mr. S. Bennett (the composer), Mr. Blagrove, and Mr. Lucas. Madame Stockhausen and Miss Bildstine were the vocalists, the former sung charmingly.

*Societa Armonica*.—We would not wish to pass an evening more pleasantly than at one of these concerts; alike certain of great variety and great excellence, and of being able to get away at a respectable time. On Monday the fourth concert was fully attended; Mademoiselle Nau sung three songs: her voice is of poor quality, but of considerable extent and highly cultivated; in our opinion, she attempts rather

too much. Mr. Barret, of whom we have often spoken in terms of praise, delighted us greatly in a concerto on the oboe, composed by himself; Mr. Hayward was too fantastical on the violin; Beethoven's exquisite overture to "Fidelio" was one of the treats of the evening. F. Lablache and Ernesta Grisi sung during the concert. We are sorry we have only two more to attend.

*Miss Steele's Concert* in the Hanover Square Rooms on Tuesday week was one of great beauty and interest. Miss Clara Novello was in splendid voice ("Prendi per me"), and John Parry full of humour in "Oh, the Merry Days!" and "The Singing Lesson." Miss Birch also sung delightfully, as did the other vocalists; whilst the instrumental attractions were well sustained by Lidel, Lazarns, and Salaman. But the chief novelty of the evening was the following charming ballad by Lover, charmingly given by Miss Steele:—

"One morn as fiercely blew the blast amid the breaker's roar,

A Rover came and fearless cast his grappling on the shore:  
But the Rover, too, was grappled there,—a captive soon was he:

Ere he saw and loved a maiden fair who dwelt beside  
[the sea.]

They loved and wed, and years soon fled, and when a  
baby's smile [while];  
Was beaming in the Rover's face, he seem'd so sad the  
He thought upon his fearful child, and look'd across the  
sea.

For he fear'd the day a Rover wild his baby boy would be.  
He kiss'd the child and gave it back into its mother's  
arms.

"One other cruise," he said, "and then—farewell to guilt's  
[alarms.]  
He call'd his hand, he help'd each hand, his sail swept far  
from shore, [more.]

But storm or strife bereft the wife, the Rover came no

#### VARIETIES.

*Caligraphy*.—We hear that, among the presents lately made to her majesty, is one of the most magnificent specimens of penmanship ever executed. It is by Mr. John Craik, the master of the celebrated Academy of the Royal Burgh of Dumfries, which has produced, in other respects, so many eminent men. At the head of the specimen is a representation of her Majesty and Prince Albert on horseback, done with the pen. Her majesty received this tribute from Mr. Craik through the Marquess of Normanby, Secretary of State for the Home Department, in the most gracious manner, it having been given by the Right Hon. Sir A. Johnston to the Marquess of Lansdowne for presentation.

*The Queen to be Ruffed for!*—Though Mr. Minasi made his delicate pen-and-ink drawing of her majesty, after *Ross*, as a companion to *Prince Albert*, we are now given to understand that the likeness is visible at 337 Strand, previous to being appropriated by raffle to the most fortunate of her (subscribing) subjects.

*York Minster*.—We observe with deep regret that this glorious edifice has again suffered from fire. The extent of the damage is not clearly stated, but it seems to have been great, and that the tower is nearly destroyed.

*Catalogue of General Ainslie's Collection of Coins and Medals*. (Leigh Sotheby).—In June, this superb collection, belonging to the late author of "Illustrations of Anglo-French Coinage," comes to the hammer, and will doubtless help to enrich and complete many a numismatic store. Above 400 lots, many of them consisting of four, six, eight, ten, or a dozen specimens, present almost every variety of metallic records. They illustrate the arts and history; and some of the most rare and the unique are objects of great interest. Where the attractions are so numerous, we need not particularise, but recommend personal inspection.

*Aubusson and Gobelin Tapestry*.—We have been gratified by the exhibition at the Egyptian

Hall of some superb examples of these manufactures. The large room is carpeted and hung round with them, and the richness of the effect can hardly be imagined. The carpets combine beautiful patterns with the gorgeous colours of the Persian loom; and the texture appears to be of a kind to make the work everlasting. The specimens of Gobelin tapestry are admirable, and some of gold tissues so splendid, that an Eastern monarch, on his diamond throne, might envy their splendour. The prices, of course, must be very high; but in days when the competition to produce cheap wares tends to the deterioration of all, it is pleasant to see the highest efforts of useful and magnificent art.

*Sir S. Clarke's Pictures*.—The sale on the 9th inst. was a repetition of the Friday's crowd and competition. The great prizes were the two Murillos, one of which, "The Good Shepherd," was bought by M. Rothschild for above three thousand pounds, and the other by Lord Ashburton for above two thousand. His lordship has since transferred it, at the price given, to the National Gallery.

*Terraces on the Banks of the Thames*.—We are glad to observe that some stir is again making to obtain this great convenience and improvement for the banks of our glorious Thames. A petition has been presented to Parliament on the subject; and a meeting was held at Sir W. Heygate's to promote it, which we regret we could not attend. At the time when the building of the new Parliament Houses must cause great alterations, it is most desirable to obtain this embellishment for the capital of the British Empire.

*The Percy Society*.—Under this title a new society is forming for "the publication of ancient ballads, plays, and minor pieces of poetry;" and a council has been chosen to carry the design into effect. The publications will resemble those of the flourishing Camden Society; and we observe with pleasure the names of Payne Collier, A. Dyce, J. O. Halliwell, Joseph Hunter, T. Wright, and other well-known antiquaries and literati, already enrolled among the leading members. Richard Halliwell and E. F. Rimbault, Esqrs., are the Treasurer and Secretary.

#### LITERARY NOVELTIES.

##### LIST OF NEW BOOKS.

Poems, by W. H. Latham, post 8vo. 10s. 6d.—Keble's Psalter, 3d edition, 18mo. 1s. 6d.—J. #### TO CORRESPONDENTS.

We thank our correspondent for directing our attention to the spacious ancient roof of the Chapter House, Canterbury Cathedral; but we are not aware of its relative proportions to the roof of Westminster Hall.

In the absence of any communication from the patentees of the electro-motive machine, we reply to X.Y.Z. that we also attribute the "increased efficiency" to the employment of Grove's powerful voltaic combination; that we believe the patent has been taken for the application of electro-magnetism to machinery; and that the "novelty" consists in the electro-magnets being stationary whilst contact is broken and renewed, and motion produced, as described in our former No., instead of by change of polarity.

Connected with Literature and the Arts.

**ROYAL MANCHESTER INSTITUTION.—TO ARTISTS, &c.**—An Exhibition of Pictures in Oil and Water-Colour, Specimens of Sculpture and Casts, Architectural Designs, and Proof Impressions of Modern Engravings, will take place next Autumn, to which works of Art are respectfully solicited.—They will be received at the Institution from the 1st to the 15th August inclusive.

Pictures from London may be forwarded through Messrs. Kenworthy and Son, carriers, and from other places by the most convenient water conveyance.

With the view of affording every encouragement to artists of ability to contribute to this Exhibition, such works as may be a credit to their skill, and command the approbation of patrons of art in this neighbourhood, the Council have been induced to offer the following prizes for competition:—

A prize of fifty pounds, to be awarded to the painter of the best picture in the Exhibition.

A prize of the Heywood medal in gold to be given to the artist of the best piece of sculpture.

A prize of the Heywood medal in silver to the artist of the best water-colour drawing.

The Council are also forming a plan to facilitate the sale of pictures.

T. W. WINSTANLEY, Hon. Secretary.

Institution, Mosley Street, May 10, 1860.

**CONSIDERATIONS on the STATE of**

**the LAW regarding MARRIAGES with a DECEASED**

**WIFE'S SISTER.**

By a BARRISTER of the MIDDLE TEMPLE.

London: Longman, Orme, and Co.

Marriage Act, 5th and 6th William IV. c. 54; commonly

called Lord Lyndhurst's Act.—Parties aggrieved by the above

Act, which prohibits Marriages with a Deceased Wife's Sister,

are earnestly solicited to co-operate in an endeavour, now mak-

ing, to obtain its repeal. The prohibition has no foundation

either in Religion or Morality, and cannot be supported upon

any ground of rational expediency.

Communications to be addressed to A. B. care of Messrs. Wil-

son and Ogilvy, Printers, 57 Skinner Street, Snowhill.—Names

will be scrupulously concealed, if desired.

Dedicated, by permission, to Her Majesty the Queen Dowager.

revised, of

**PRACTICAL INTRODUCTION to**

**LATIN PROSE COMPOSITION.**

By THOMAS KERCHEVER ARNOLD, M.A.

Rector of Lyndon, and late Fellow of Trinity College,

Cambridge.

Livingtons, St. Paul's Churchyard, and Waterloo Place,

Pall Mall.

\*This work is founded on the principles of imitation and

frequent repetition. It is at once a Syntax, a Vocabulary, and

an Exercise-Book; and considerable attention has been paid to

the subject of Synonyms.

Also, by the same Author,

1. A Practical Introduction to Greek Prose

Composition. 3d edition, revised, 8vo. 5s. 6d.

\*This is nearly on Ollendorf's Plan, and consists of a Greek

Syntax, founded on Buttman's, with easy Sentences to be trans-

lated into Greek, after given Examples, and with given Words.

2. Henry's First Latin Book. 12mo. 3s.

In cloth boards.

\*The object of this work (which is founded on the princi-

ples of imitation and frequent repetition) is to enable the pupil

to do Exercises from the first day of his beginning his Accidence.

3. A Latin Syntax for Beginners, with

copious Examples; being an Adaptation of Broder's "Little Latin

Grammar" to the Eton Syntax, and intended as a Companion

and Supplement to that Work. 3d edition, enlarged, 12mo.

2s. 6d.

**MR. THEODORE HOOK'S NEW WORK.**

Now ready, at all the Libraries, in 2 vols. post 8vo. with

numerous Illustrations by Phil,

**PRECEPTS AND PRACTICE.**

By THEODORE HOOK, Esq.

Author of "Sayings and Doings."

"Precepts and Practice" is a series of tales, or sketches of

society, after the manner of "Sayings and Doings." There are in

these volumes tales of fun, of war, of romance, of reality, of do-

mestic life, and of out-of-the-way adventure, and we have re-

perused them with unabated interest. The severest test to which

an author can be subjected is, if he can wish to recur to his writ-

ings again and again? To this test Mr. Hook may appeal with

confidence; for in his works a reader fails not to detect fresh

beauties on each occasion. They bear within them the vitality

of genius,—an English wholesomeness that is at once salutary to

the temper, the heart, and the mind."—*Conversatory Journal.*

Henry Colburn, Publisher, 13 Great Marlborough Street.

In fcap 8vo. price 5s.

# THE HOLY LAND.

DAVID ROBERTS'S VIEWS IN PALESTINE,

AND IN

EGYPT, ARABIA, AND SYRIA;

WITH

HISTORICAL AND DESCRIPTIVE NOTICES,

By the Rev. GEORGE CROLY, LL.D.

Rector of St. Stephen's, Walbrook.

MR. MOON feels happy to announce that, by an arrangement with Mr. ROBERTS, whose taste and talents are so well known, he will have an opportunity of presenting to the British Public, in rapid succession, a Series of engraved Prints from the Drawings made by that distinguished Artist, on his late tour through the Holy Land and the adjoining Countries, especially with a view to illustrate the localities and landscape of Holy Scripture.

He feels that it would be altogether superfluous to dwell on the interest which attaches to countries, the seat of the earliest civilisation—of the most picturesque and peculiar habits of mankind—of the original learning, and, above all, of the two great Revelations of the Divine Will. If it is natural to regard the scenes of remarkable events, even in heathen history, with classic emotion, how much more natural, powerful, and solemn, must be the feelings excited by scenes among which lay the greatest events of human nature, from the beginning of time, and which will probably be again the theatre of events still more influential, superb, and comprehensive:—the plains trodden by the Patriarchs—the very cities in which the Prophets and Apostles preached—the very mountains and waters hallowed by the presence of the great Sovereign and Inspirer of them all!

MR. ROBERTS's journey extended through the whole range of the countries at the head of the Mediterranean. The mere names of Nubia, Egypt, Idumea, the Wilderness of Sinai, Palestine, Syria, and Lebanon, are sufficient to express the nature and variety of the subjects which must offer themselves to an accomplished pencil; and the singular accuracy and graphic power of the Artist have fully availed themselves of the opportunity.

The Publisher proposes to give *Facsimiles* of those Drawings, of the size of the original, executed in Lithography (with the advantage of being executed under the eye of the Artist), and to issue them in Parts, each Engraving accompanied with a Letterpress Description, explanatory and historical, from the pen of the Rev. DR. CROLY.

This Work will be published in imperial folio, in Parts, at 1*l.* 1*s.*; Proofs, at 1*l.* 11*s.* 6*d.*; and a few, coloured and mounted, in imitation of the Original Drawings, in a Portfolio, at 2*l.* 2*s.*

### M. VON RAUMER IN ITALY.

THE distinguished traveller and author, whose name heads this notice, has just completed a new work on Italy, in which we find many statements of considerable weight and importance. It is evident that he must have had access to sources of high and authentic information; and, under such circumstances, we have thought that we could not better consult the feelings and interests of a mass of British readers than by laying before the public a translation of what M. Von Raumer says relative to the SULPHUR QUESTION, now at issue between the governments of England and Naples. We generally prefer more literary matter in our selection from books, and do not mean to neglect the writer in that respect; but, in the first instance, the light thrown upon a subject, the particulars of which have hitherto been little explained or understood, and which involves individual fortunes and national objects to a very considerable extent, has induced us to depart from our rule in order fully to elucidate this singular question.

Naples, 15th July.

In the recent negotiations for a change of the existing system, and the conclusion of a commercial treaty with England, all those prejudices have been again developed, and all those errors defended, which sound knowledge and extended experience have long ago refuted. The greater merit, then, attaches to that high state functionary who neither loses patience nor fails in courage in the task of cleansing this Augean stable, and leading his fellow-men to new and better paths. He has triumphantly proved, 1st. That the former treaties with France, England, and Spain, as well as the domestic privileges and bounties granted, were partial and prejudicial; and that trade had "progressed," not by their aid, but in spite of them. 2dly. That such treaties are unjust towards other powers, whose flags they scare away (to the prejudice of the productive classes), and occasion retaliation (to the prejudice of the merchants). 3dly. That it is at once unjust and absurd to seek to gain in trade by the injury of others, and by monopoly. 4thly. That in these times competition in taxation, chicanery, and overreaching, can never be made the basis of commercial treaties; but candour, regard to mutual interests, and genuine reciprocity.

If the Prince of Cassaro succeed for his country's weal, in carrying out these views, then that huge monster—the offspring of similar ancestors—the Sicilian Sulphur Monopoly, must die a deserved death. And the ascendancy which, with juster principles and greater activity, the Sardinian States now exercise over the Neapolitan must decline.

Malta, 20th August.

You will, no doubt, remember the practice in former times of giving youths at school Latin exercises containing, purposely, every possible

error of orthography and syntax, in order that, by correcting them, they might learn how Latin must not be written. The same course appears to have been pursued at Naples in legislating on the sulphur trade of Sicily; it is clearly and abundantly shewn by the new regulations and contracts how, according to genuine knowledge and experience, affairs of this kind ought not to be negotiated and settled.

The contract between the government and the firm of Taix and Aycard, in particular, is a *monstrum horrendum, ingens, cui lumen ademptum*, such as will scarcely appear again in the modern financial history of Europe. Imputations of this kind are rare, but it would not be difficult to substantiate them.

When, a few years ago, the price of sulphur, the most important export article of Sicily, was depressed, from various natural causes, all the sellers complained (as usual), and many besought the GOVERNMENT to adopt some measure to raise the price and the profit. This error, of supposing that any government could regulate at pleasure the buying and selling prices of goods, was taken advantage of by mercenary persons, and a Mr. Taix submitted a grand scheme for affording relief to the sellers.

Undismayed at the rejection of this project by Sicilian commissioners on very good grounds, Mr. Aycard came forward with a second, and, finally, with a third; in which it was hinted, that it was foolish to permit the owners of the sulphur mines to exhaust them by overworking; the state should interfere to check such selfishness, and chase away the empty dream of free trade. The monopoly of the sulphur trade, conferred by nature on the island, ought to be secured and maintained against all foreign countries. It would be a blessing if Sicily produced but little sulphur, and obtained for this little a great deal of money. A commercial company alone could accomplish this desirable end, and Messrs. Taix, Aycard, and Co. were willing, out of pure generosity, to undertake this hazardous business; and, moreover, to construct roads, give alms, indemnify proprietors, and found a mineral cabinet in Palermo!

Arguments and decoys of this kind won and entrapped many of the ignorant; in other places other means were employed; but a discussion in full council was avoided, and the management of the affair intrusted principally to one minister. At the same time loud complaints were heard in Sicily about the meal-tax, which, in recent times, had been so much increased; and certain parties were importunate for a reduction of this duty, not from a sense of justice, or because its revenue could be dispensed with, but because then the *salto mortale* of founding a sulphur company would be inevitable.

Accordingly, there appeared, on the 27th June, 1838, a royal ordinance, signed by the minister, S. Angelo, the introduction to which runs thus:—"For the benefit of our beloved subjects, for the payment of debts in Sicily, to lighten burdens, to disseminate great wealth, and to call forth, in all quarters, public works, which the island so greatly needs (without giving ear to schemes of privileges and exclusive

rights), a contract has been entered into, for ten years, with Taix, Aycard, and Company, the principal clauses of which are as follows:—

1. As the great production of sulphur is the cause of all the distress in Sicily, the same shall be reduced from 900,000 cwt. annually to 600,000, or one-third.
2. The average produce of 1834-7 shall determine the amount of the two-thirds, beyond which, in future, no sulphur shall be brought above ground.
3. The price at which the company are to purchase, and that at which they are to sell, are to be fixed by authority.
4. They shall pay his majesty, annually, 400,000 Neapolitan ducats.
5. The owners have full and unlimited power to sell their sulphur to whom they please, and to send it whither they choose, should they not be disposed to let the company have it."

Thus favourable to free trade is the wording of the ordinance of the 27th June, 1838; but in the contract concluded by S. Angelo with Taix on the 8th August, a single short line is introduced after the words "have it," viz. "provided the owners pay to the company twenty carlines per cwt."

These are the main features of a contract which, I repeat, will scarcely find a parallel in the history of finance. Although it needs no comment, I cannot refrain from offering a few remarks:—

1. No doubt the quantity produced may exceed the consumption and the demand; then the prices decline, and this passing or permanent token serves to instruct the intelligent miner to circumscribe his business here or there, and more or less, or in the prospect of a favourable change in the market, not to circumscribe it at all. The circumstances and relations of persons and things are so exceedingly multifarious, that the individual alone can, in such a case, decide upon the proper course; it is gross and palpable folly to decide alike for all the numerous parties concerned. Every regulation of that kind rests solely upon caprice, and always effects too much or too little.

2. It is an error of the first magnitude to attempt to raise the wealth of a nation by legislating to diminish production and labour. The old fabulous practice of the Dutch, who were said to throw their spices into the sea to enhance the prices, has been repeated in our professedly enlightened days, and the principle carried out on a grander scale. The inference is, that the production of oil, wine, wheat, &c. will in turn be restricted for Sicily's weal,—all to create wealth, pay debts, &c. &c. &c. What wise magician, what recondite oracle, can have inspired or revealed the regulating principle of two-thirds and one-third? If an English minister had proposed such a measure with reference to the working of the coal-mines, he would have been deemed only fit for Bedlam.

3. One error leads to another. The average of three years is to determine the future extent of the trade, without reference to good or bad years, limited or increasing capital, and without liberty to "progress." As soon as the two-thirds, by pound and ounce, are brought above ground, the works are at a stand; yes, one-third of all the workmen are, for the public weal—for the increase of wealth, suddenly deprived of their bread, and will be driven by hunger to robbery and plunder. The govern-

ment itself has undertaken the task of forming an inexhaustible nursery and plantation of wretched beings and criminals; and their ill-gotten gains will be swallowed up by the expense of sending regiments of soldiers to Sicily for preserving public order. The further we go into details in this business, the more conspicuous does its utter absurdity become. Thus an American house expended large sums during the years 1834-7 in preparations for working some sulphur mines, but have yet got no returns. Thanks to this wise law, so must things remain with them for the future. There are but too many examples given of caprice, concealment, fraud, the impossibility of control, and redoubled injuries to the small proprietors.

4. How tyrannical and preposterous it is to fix the prices of purchase and sale for years in advance is known to every one acquainted with the A B C of national economy; and the company who think they have reckoned so well for themselves, will, at last, find that they have miscalculated! If, however,

5. They were to realise no profit, still the 400,000 ducats, which (to increase their wealth) are to be levied upon the owners of sulphur mines, would be a most unjust, and, beyond all measure, oppressive impost. But, perhaps, the most annoying and disgusting circumstance of all is, that the projector of this law talks, with incredible hardihood, of his hatred of privileges and grants, and lauds the perfect freedom of trade; while, by the twenty carlines per cent, he ensures a monopoly to the company, and renders free trade utterly impossible to every proprietor.

At the same time, the company know how to avoid purchasing at the prices fixed; search is making every where after sulphur, out of Sicily; and a discovery that has been made in Manchester serves for many purposes as a substitute. In spite of all their repentance and all their modifications, incompetent legislators will, in a short time, have so completely destroyed the staple trade of Sicily, that there will be no possibility of recovery for this otherwise wretched and discontented island. Averse as I am to join in the too-frequent complaints against authorities, yet here there is unfathomable ignorance; or else more culpable grounds may be assigned, which are talked of so loudly and with so much personality in Naples and Sicily, that I do not venture to report them. But the Sicilians themselves are not free from blame, for if we cannot ascribe to many a thorough knowledge of the true principles of political economy, still the experience so rapidly gained, and the outcry of the distressed people, should have enlightened them. Instead of which, not a few, even of the first families, returned thanks to the king, in a memorial, when in Sicily, for forming the Sulphur Company. If now ignorance, error, cowardice, flattery, venality, or all these combined, brought about this measure, certainly these stupid eulogists have no longer any right to complain; or the functionaries attacked may hold before them their own manuscript, like a Medusa's head, and laugh them to scorn. And if, in the meantime, their country and the people sink deeper and deeper, whom does it concern? Or those whom it does concern have no legal means of redress at their command, and the illegal they shun from fear of the laws.

Munich, 12th September.

If you combine the hints contained in my two last letters with what I have before stated here and there in a desultory manner, you will find many chasms filled up. After touching upon some general topics concerning Italy, it

would, perhaps, not be amiss to pass the individual states in review once more, and to call to mind their peculiarities, their present existence or non-existence. If we commence at the south, and with Sicily, we shall have to reproach the inhabitants with too much rather than too little patriotism. But this by no means diminishes their perception of the wants of the present, or their sensibility to them; on the contrary, the poetically depicted past appears in a twofold brighter light, and the gloom of later times is imputed to the Neapolitan government. As a proof to what an incredible and unjust height suspicion and reproach have been carried, I need only mention the following assertion, which gained credence with not a few, namely, that government purposely transplanted the cholera to Sicily to be revenged on, and to sacrifice, the inhabitants!

And if we entirely discard this offspring of fear and passion, yet we perceive, on all hands and in every degree, manifestations of the existing state of things, which, without an exception, shew deeply rooted disease. "If," say a great many, "the government do not exactly wish to poison the inhabitants, yet they would be glad to plunge them into poverty and wretchedness, to crush them to the earth in an unheard-of manner, in order that distress may induce blind subjection, or despair result in rebellion, which would serve as a pretext for excessive and capricious tyranny." "The government," say others, "is, though unaware of it, stimulated to these detestable measures by the Carbonari, who still exist in the kingdom of Naples. During the periods of former troubles Sicily was always a secure place of refuge for the kings, a rallying point from whence Naples could be recovered. But if, on the contrary, Sicily were opposed to her sovereign, and excited to hatred and insurrection, the Neapolitan revolutionists would be unencumbered, and have twofold power to carry out their schemes. They wish Sicily to make a commencement and prepare the preliminaries, that they may follow with convenience and security." All these views are combined with hopes or dreams of total independence of European revolutions, of aid from England, and, in some cases, of British dominion; which, in fact, might prove the best means of bettering the condition of this unfortunate island.

Ireland, the English Sicily, might start at such thoughts, yet peculiar causes of misgovernment exist there, and the future is far more hopeless for Sicily than for Ireland. The more I reflect with feelings of sympathy upon the subject, the more completely I am lost in doubt and obscurity. Such multilateral and total reform and regeneration as Sicily stands in need of is doubtless impracticable. The peasantry, the citizens, the nobility, the priesthood, the conventual system, the government, the constitution, all must be changed, radically and totally changed, be cast into a refining furnace, a purgatory. Every one is sensible of this and recommends it to his neighbour, but is unwilling to take it upon himself.

The most incomprehensible of all, as the most culpable, is the government, of which I have before given a few instances, selected as the most striking. The modern history of Europe presents many examples of ill-adapted, irrational, criminal forms of constitution, and has induced many to place their sole reliance on a good government. But whoever desires to witness the sufferings and the ruin that ensue when all and every form of government is wilfully laid aside, and an ignorant, mercenary bureaucracy occupies the throne, should

go to Sicily. Not that there is a total absence of intelligent and disinterested statesmen, of praiseworthy schemes and useful measures, but a man must be more than a Hercules to cleanse this Augean stable.

That all this is endured, that there is not a general and determined resistance, must not be ascribed to patriotism, confidence, piety, conscience,—but to fear that the Sicilian rabble, once let loose, would know no moderation in revenge and retaliation, but would plunder and massacre even those who incited them against the detested Neapolitans. This, according to the admission of the Sicilians themselves, is the present aspect of affairs in Sicily.

In Naples, owing to the more volatile character of the people, things look less gloomy; and besides, the Neapolitans stand to the Sicilians in the light of rulers and leaders of the fashions. But the fact, that even here there is scarcely one individual who approves, respects, and defends the government, is something so painful and distressing to an interested observer, that it requires all the charms of that exquisite climate to make one forget it for a few hours. But then the opposition between the works of the Creator and the works of man becomes doubly conspicuous, and sounds like an unresolved discord in the harmony of nature. There is, however, a remarkable difference between the views of the elder and younger Neapolitans. The former were once persecuted, and suffered from various revolutions; they, therefore, desire repose, and are grateful to the government that procures them this, even by culpable means. The young men, on the contrary, have no immediate acquaintance with the olden times; consider it no merit in government that they are not persecuted; think that the attempts at reform were foolishly set about, and live in the conviction that they could manage matters more prudently, and reach the goal. At all events, the probable gain is greater than the loss to be apprehended. This party increases daily, while the former declines. Placed between both, the government has no determined course, no fixed object, thinking, by means of the police (which operates only negatively, and on individuals) to preserve or restore the health of the whole community. There is, in the laws and their administration, so much that is unconnected, crude, and contradictory, that it is very difficult, or rather impossible, to find out the why and the wherefore. Add to this (as is stated) an unfortunate aversion of the government to distinguished talent. Burke was perfectly right when he said "mere talent inclines to Jacobinism." Instead of being exercised in practical activity, it is always superseded and forced to discontent. This dread of genius, this preference of feeble mediocrity, is the more prejudicial, as Naples is by no means wanting in very distinguished and learned men. From their forced elevation, however, many mistake mere passion for inspiration, and imagine that their skillful pliability render firmness and character unnecessary. And yet the Neapolitan history, in particular, shews, most obviously, that without these neither individuals nor a nation can become great.

If revolutionary outbreaks are prevented in Sicily by fear of the domestic rabble, in Naples the fear of the Austrians is an additional check. "In the whole history of the world," said a Neapolitan to me, "there is nothing grander, wiser, more temperate, or more admirable than the Revolution of Naples in 1820." This prodigy the Austrians have destroyed. But even those

who deem this prodigy an absurdity do not thank the Austrians for destroying it. The government, especially, are ashamed of their weakness, and that they owed their preservation and reinstatement solely to foreign power. Certainly the Austrians will not tolerate an army in revolt, or revolutionary constitutions in southern Italy; but it is unreasonable to maintain that they require, or introduce, irrational measures, which would be quite at variance with what they have so laudably done themselves in the kingdom of Lombardy. Such, for instance, is the unhappy tendency to centralise and to model Naples and Sicily in one mould; the direct opposite of the practice of the Austrian government in their dominions.

"We," said a high Austrian functionary, "are quite unable to exercise any wholesome influence whatsoever upon Naples; the government would pay more deference to suggestions from the Dey of Tunis than to ours." Thus they think to shew independence and self-subsistence, and at the same time use the Austrians as a scarecrow against those who are justly malcontents.

#### REVIEWS OF NEW BOOKS.

*Emily; or, the Countess of Rosendale. A Novel.*  
By Mrs. Maberly. 3 vols. London, 1840.  
Colburn.

"O! THEN I see  
Queen Maberly has been with you."

must, we suppose, be our accepted motto, when we approach this feat of Fashion's midwife. Very pretty women ought not to put on blue stockings; their natural attractions are more than sufficient for triumph in this ugly world, and it is intolerable to add this tyranny of literary talent to their chains: we allow them to be personal to the extent of their beauty, but agreeably to a fair distribution of power upon earth, they ought, in conscience, to leave it to the homely and ill-favoured to put forth the claims of genius to our homage and allegiance.

But, after all, a fashionable novel may be committed without any gross stretch over the domains of fancy. It need only be a sketch of manners such as they appear to the writer, and if executed in a likely and lively manner, it is all that the readers of such productions require. For them, therefore, the story of *Emily, Countess of Rosendale*, and her compeers, will be the book of the hour. It is the performance of one whose station in society has afforded her opportunities for observing what she has undertaken to draw; and we have but to regret, if the picture be true, that the subject has furnished so little to admire in the circles of life to which it relates. The heroine and hero are, of course, nonsuchers, and they have about them two or three tolerable pippins to keep them company; but the rest are a sad set of frivolous and vicious characters. With them a residence at a noble country-seat, a *déjeûné*, or a ball, are like nothing we ever heard of but the assemblage of beasts in Noah's Ark, where they met for no other purpose but pairing. And order of doing so seems wonderfully unsettled. Lord M—— wants to pair with widow B——; Colonel F—— wants to pair with Lady M——; widow B—— wants to pair with the hero, and he wants to pair with Emily, and so does Mr. F. M——; whilst Mr. R—— wants to pair with Lady F——, and she with somebody else; so that throughout the chapter there is a continual sequence of flirtations (the soft word for dangerous incom-

pleted intercourse), intrigues, and amours. We will not venture to pronounce that this is or is not the actual state of matters among the upper ranks; but we are inclined to suspect that with them, as with the middle and lower orders, there is a division into two classes,—the free and easy lapsing into the vicious and criminal, and the right-minded and correct rising into an habitual exercise of all the higher virtues that belong to and adorn our common humanity.

With these general remarks, we shall say very little of the details of this novel. Mrs. Maberly's veneration for small hands and feet is among the peculiarities which have struck us. Heaven help the snitor for her good opinion who should walk up to her on splay soles or lumbering pedestals; for she speaks (p. 37) of hands and feet which were "small, and had the appearance which only *high-bred hands and feet* can have." Now, *high-bred hands* are intelligible to us; but *high-bred feet* appear to us a sort of inversion of the order of nature, as if we walked on our hands, or stood on our heads.

A vulgar family of the name of Robinson are contrasted with the Quality; and, as usual in such cases, the *parvenus* are exaggerated portraits. People worth half a million nowadays find it easier to get into all but the very *élite* of the Corinthian orders than heretofore; and we would say that, with the exception of a very limited and select society (and that, too, fast vanishing into the surrounding earth-born clouds, irradiated with the brilliancy of wealth), there is no place, from the Opera House and rural *fête* to the throne-room and Almacks, which Plutus has not the means to penetrate as effectually as Jupiter. The sisters of the Robinson family are facsimiles of those in the household which boasted a Cinderella; and in Ellen, the youngest, and the Cinderella of the same, we have a trait not unworthy of "The Rovers of Weimar."—"I never saw you before! Let us swear eternal friendship." In the modern instance it runs thus:—

"Emily looked from the masses of blonde and satin to the trembling and blushing girl before her, and a suspicion of the truth flashed across her mind. 'She has never been out yet; but she is a good girl, and as great a comfort to her father as ever man was blessed with,' replied Mr. Robinson, with a feeling of honest, affectionate pride, that went straight to Emily's heart. She took Ellen's trembling hand, and, saying a few words in her own sweet tone, good-naturedly made room for her on the sofa by her side. Poor Ellen was nearly overcome by this little act of kindness; she was so unaccustomed to any thing of the sort; she never expected the least attention from any one. At last she ventured to raise her eyes to the face of the beautiful creature whose sweet words had almost dissipated her fear; and as she looked upon her, Ellen's grateful heart swelled almost to bursting; she felt at that moment that she could have died for her."

For a seat on a sofa! But we have noticed that the Robinsons were caricatured. For example, when they give a grand dinner:—

"Mrs. Robinson, far removed from such sober conversation, was in her glory. Seated by Colonel Marsden, who, with his usual placid smile, was swallowing her bad champagne and worse compliments together, she was perfectly satisfied that every thing was quite right. She neither knew nor heeded what the dinner was, so there was plenty of it, and the table literally groaned beneath the weight of the massive *épergne* and candelabras, and the number of dishes with which it was crammed, until

scarcely a vestige of the tablecloth was visible. But she knew that she paid her cook and her butler much more than any one else did theirs, and that she had ordered that no expense should be spared, and a splendid dinner sent up; and what more could any one do?"

Upon which we would observe, in defence of the rich commercial classes, that they are as likely to have good champagne (a blessing in its way) as the oldest peers of England; and that, if they pay their cooks and butlers the best wages, these worthies, however vulgar or ignorant their masters or mistresses may be, know their duties, and value their *honour* and reputation too much to disgrace themselves by serving up a rabble tavern entertainment: nor would the hostess, in conclusion, press her visitors to supper—yet it is here so represented:—

"Emily, taking advantage of the first moment of repose she had been allowed to enjoy during the evening, sat down by the neglected Ellen, who, on receiving a hint from Mrs. Robinson, had withdrawn from the vicinity of the commerce party; which, indeed, she felt no inclination to join. Emily continued talking to her and Mrs. Belmont until her carriage was announced; and, resisting Mrs. Robinson's entreaties that she would stay to supper, at length accomplished her departure, completely wearied and worn out by the festivities of Myrtle Hall."

But there are points above all male authorship, and we must acknowledge above male criticism. For instance, the heroine's appearance on this occasion:—

"She was plainly, but not what Miss Belinda Robinson had been pleased to call shabbily, dressed. Her gown of pale pink silk fitted her exquisitely proportioned figure to perfection. A light fall of blonde relieved, while it did not conceal, the beautiful contour of her neck and shoulders. She wore but few ornaments; a single row of pearls upon her neck, while another partly confined the rich brown hair which fell almost to her shoulders in large curls of glossy softness. Bracelets of pearl clasped with diamonds set off her beautifully rounded arms; and her glove—that most generally neglected part of an Englishwoman's dress, fitted her so nicely—was so well put on, that it neither concealed nor disfigured the delicate little hand it covered. All this was duly examined by Frederick, who was a great connoisseur in ladies' dress. He could not deny that in that particular there was nothing to find fault with;—at least, he need not be ashamed of her as his wife; and this idea went far to reconcile him to the fate to which he concluded he must one day resign himself."

Who would not, and with pleasure, to a lovely girl who could attire herself in such a style? Why, half of it would have settled the soul of any reasonable man.

As our rule is not to break into the plot of works of this kind, we must be content to add that some of the characters are painted with talent and discrimination. Colonel Marsden, the villain, is one specimen; and his equally cold-blooded, heartless son, is another. The latter, in particular, is the representative of a class of young men, whose early lives are given up to the pursuit of pleasures, the best of which are but silly toys; and the worst, such as spread misery and wretchedness among the victims of their lawless and remorseless arts. There is some excuse when feeling and generosity do their utmost to alleviate the distress; but when there is only a gratification of vanity or lust, followed by an utter disregard of the consequences, every honest hand should be

armed with a whip to lash the villain naked through the world.

For the rest, we quote an example:—

"Lady Frances Germaine was one of those women who, pretending to be *intacte* themselves, hesitate not, should they fancy they discover in any of their friends the smallest symptom of preference for any one, to tear her to pieces immediately—to see more than ever could be seen, or had been seen, in her conduct, as improper—to denounce her directly to all their acquaintance as 'a horrid woman,' quite unfit for society; but at the same time to appear themselves in that same society, regularly escorted by their own favourites, to whom they pay devoted attention. To be sure, 'it is only a cousin,' or 'their husband's particular friend,' or 'their particular friend's husband;' and there is nothing in it—it is quite absurd to talk about such people. Lady Frances, in common with a great many others, forgot there might be a beam in her own bright eye. Incapable of liking any thing but herself, she had never been the object of a real attachment, but was always attended by one or two dangles—men, more remarkable for the fineness of their cambric, the smartness of their coats and their cabs, and the innate conviction of their own self-importance, than for any distinction of worth, intellect, or acquirements. She had for some time past made up her mind that Colonel Fitzmaurice in every way suited her, and that he would look well in her train the following season. No two people were ever better matched. He felt not the slightest affection for her; but she was a handsome woman, very well placed in society—intimately acquainted with all the great people, cabinet ministers, &c., for whom he entertained the most profound respect: and then, she had a good house; old Germaine gave capital dinners, had the best wine in London, and turned out his carriages and horses to perfection. Colonel Fitzmaurice had therefore decided that it would look very well to give himself all the airs of a *liaison* with Lady Frances, and actually had gone the length of stopping her barouche, more than once, just opposite Stanhope Street Gate, in hopes that the group of idle friends who sat lounging there, with their hats on one side of their heads and their legs on one side of their horses, might imagine and perhaps accuse him of having 'cut out' some other admirer."

Such is the general tenor of this novel; and we leave it to those who love to pore over the reports of court dresses on drawing-room days, the reports of indiscretions, elopements, &c. which sometimes find their way into the newspapers; and, in short, the reports of all the doings and misdoings of the fashionable world,—here they are wrought into a connected and consecutive story, with the intelligence and tact of a near observer.

*Travels to the City of the Caliphs, along the Shores of the Persian Gulf and the Mediterranean; including a Voyage to the Coast of Arabia, and a Tour in the Island of Socotra.* By J. R. Wellsted, Esq. F.R.S., &c. author of "Travels in Arabia." 2 vols. 8vo. London, 1840. Colburn.

THE whole of the first, and above a hundred pages of the second volume, are occupied with the travels and adventures of Lieut. Ormsby, whose notes and relations have been licked into literary shape by an editor whose own travels in Arabia had established for him a popular name. Lieut. Ormsby is an example of that set of devil-may-care English youths,

whose ardent spirit of enterprise prompts them to undertake the most perilous expeditions, not simply for the sake of seeing the world, but, apparently, for the pleasure of seeing it under the excitements of privation and peril. As stolen waters are said to be sweeter than other unforbidden springs, so, we suppose, there must be an extra enjoyment in traversing countries where danger besets every footstep, and it is so hard to get a dinner or a supper, that the traveller is as often postponed as he is gratified. Perhaps Mr. Ormsby was intrusted with some mission; but, if so, it is kept secret, and we are merely informed—

"It is a singular fact, that a small service like the Indian navy should have, in one and the same year, seven midshipmen, four of whom have traversed more of the East than probably the same number of individuals alive—Ormsby, Lynch, W—, and, may I add, the editor of these volumes. We now lived together: our days were passed in the manner I describe; our evenings were usually passed smoking and drinking coffee at the house of some mutual acquaintance. Rustom Beg and I lived in great harmony, and I was fast improving under his tuition, when, lo! one morning I went to his room, and found it untenanted. Furniture there was none at any time, not even the luxury of a carpet; he always slept on the bare floor. I, therefore, inquired of the janitor of the khan if he knew aught respecting him, and I learned, with not much surprise, that he had risen early, saddled his mare, purchased some grain for it, and a few loaves of bread for himself, which he placed in the nosedrag of his horse, and had then ridden off, he knew not whither. A week elapsed, and still there were no tidings of Rustom Beg, and I had given up all hopes of seeing him for years, when, one morning, while I was seated sipping my coffee in the gateway of the khan, who should ride up but my friend, pale and emaciated. His burnoose and sword had disappeared; and the horse, which before was sleek, fat, and playful, now hung his head drooping, and was a perfect skeleton. Our greeting was most cordial. A meal was soon provided, and after he had satisfied the cravings of his appetite, a matter neither hastily nor easily accomplished, he related his adventures:—"I had," said he, "found myself out of sorts that morning, and thought a trip to the desert, to visit a sheikh of my acquaintance, would put me in order. For three days I journeyed without meeting any one. I now found the encampment of my friends, who treated me with their usual hospitality, and I passed a day with them. On the following morning, returning by myself towards the city, I was met by a party belonging to another tribe, who without any hesitation fell upon me. I had nothing left but to dash through them. One I cut down; at the same instant I received a wound in my sword-arm. A passage was now, however, opened to me: but one horseman, as I dashed by, grasped my burnoose. The shock nearly unhorsed me, but I left a portion of it in his hands, and was away, with the whole party in full gallop in the rear. The fleetness of my horse saved me, and here I am." He bared his arm, and shewed me his wound, which was a deep gash; but his strong constitution, aided by his plain diet, enabled him soon to get over it."

Again, near Kerbela, the story goes:—

"Large quantities of rice and other grain are reared in the vicinity of this town. As the stream here is rapid and narrow, the only way of passing it is by means of tracking; for the wind, if fair at this season, is scarcely ever of

sufficient strength to carry the vessel against it. I was in hopes at first that the passport of the British resident would have formed some protection to me; but they no more heed'd that than they would have done a firman from the Grand Signior. Their first contributions were levied on our trackers, who were successively deprived of their turbans, their sandals, and their waistclothes. They now walked on board, and helped themselves to whatever they required: 'Your uncle wants it,' was the only reply I could get to my remonstrances against such uncereemonious appropriation. Resistance, however, would have been madness, and, in the course of an hour, fire-arms, cooking-pots, and every item of provisions, had disappeared; our clothes in which we stood alone were left us. Highly exasperated at their losses, it was with much difficulty I could keep the trackers to their work, and when we arrived at Lemlum they all deserted. Here, therefore, was I left without a crew, or any means for the present of prosecuting my researches. Fortunately, some gold sequins, which I had concealed about my person, enabled me for a time to obtain the necessaries of life; but these were fast vanishing, when I was one morning unexpectedly joined by a fellow-countryman, who, under the designation of Dervish Ali, was travelling in these regions. His real name was Elliot, but he affected the character his former designation implies for the better furtherance of his views. Of a wild and roving disposition, he had traversed the greater part of the East, and had lately employed himself in sketching the ruins of Babylon. An itinerant singer and story-teller accompanied him. The dervish was not better provided with funds than myself; and at length it was resolved that we should pay a joint visit to the sheikh, and request his assistance to procure trackers for the river. On our way to his residence we found the people hurrying to and fro in great confusion, and upon our arrival at the sheikh's residence, we found that the town on the land side was about to be invested by some Bedowins, who were perceived marching against it. He was consequently very busy giving the necessary directions, and when we approached and stated our errand, he cast a rapid glance over us, told those around him we were suspicious-looking dogs, and ordered us to be imprisoned until he had leisure to investigate the matter. I attempted to remonstrate, but he would not hear a word: his followers seized and conducted us to a miserable hovel, into which we were rudely thrust, and a guard of Arabs stationed at the door. As these men cooked and carelessly sipped their coffee, they placed their matchlocks beside them, and intimated very intelligibly that they would shoot any one who attempted to escape. Elliot's friend, the singer, was the only man left in the boat, where he remained during the night undiscovered, but next morning great was our surprise to observe him rush into the hut, his face covered with blood, his clothes tattered, and otherwise a piteous-looking object, to claim our protection. After he had somewhat collected himself, we found that at daylight, feeling very hungry, and not knowing what had befallen us, he landed to procure some food and ascertain our fate. From his not wearing a beard, the people in the bazar took him for a Sunnee, with whom they were then at war, and imagined he was a spy. At first they were for stoning or cutting him to pieces, but finding, after some questions, that he belonged to our party, and was professionally a singer, and not

a warrior, they contented themselves with beating him most unmercifully, and then driving him before a crowd of boys to join us. The singer displayed little meekness under his afflictions; and at first I was fearful he would not confine himself to the volley of abuse and imprecation he levelled at the head of the dervish, as the author of all his misfortunes. Elliot was, however, impenetrable to such an ebullition—he listened to all with a truly Mahomedan indifference, and, when the singer's wrath had subsided, read him a lecture on the folly of intemperate and passionate behaviour so totally unbecoming a true believer. Never was a man better calculated to deal with the natives than was poor Elliot. After some hours' confinement we began to feel the pangs of hunger, and our guards, after we had implored for some time, brought us some cakes of bread and dates, to which Hadji, by pledging his turban, had obtained in addition some coffee and tobacco. With these and some of Hadji's tales, we contrived to make the time pass very tolerably. The firing was continued during the night, accompanied by the shouts and yells of either party; these, as the morning broke, approached nearer to us, and more than once, when the balls whizzed past us, I observed our guides [guards?] looking over their shoulders. Sleep was out of the question, so we sipped our coffee and laughed at the fears of our guard, although no ways indifferent, either to the present state of affairs, or to their probable result: should the besiegers succeed in taking the town, Heaven knows what our lot might have been. The sheikh on the following morning gave battle just without the walls to the enemy, who, it appears, during the night, had, on more than one occasion, effected an entry within them. Several wounded men continued to be brought past our hut; one had his thigh-bone shattered with a musket-ball, and had moreover a ghastly wound in his head. As he was borne along, he implored in hurried and feverish accents for water: I seized a jar, and without any opposition from my guards handed to him. The dying man drank, and bestowed with almost his last words a blessing on the hand of the Christian who had relieved his sufferings. Our state of suspense was at length put an end to by the arrival of a troop, who came galloping along to announce that the Lemlum people were the victors, and that their foes had retreated to their deserts. Some hopes were now entertained of our release; and, accordingly, a few hours afterwards we were summoned into the presence of the sheikh, and after numberless questions had been put to us respecting the nature of our employment, with the answers to which he appeared to be satisfied, we were told to quit the town forthwith. But this, I endeavoured to explain, having neither money nor men, was not easy to be done. His answer was brief and characteristic: 'That,' said he, 'is your affair, not mine: depart to-day, or look to your heads.' There was no appeal from, or evasion of, such a decree, and the few hours left us were busily employed in endeavouring to find out how this could best be done. At length we incidentally heard that a Persian merchant resided here who had been formerly attached to the British residency; to him we therefore bent our steps (sad and slow), and after narrating our tale, succeeded in obtaining an hundred dollars—giving him in exchange a bill payable at Bagdat. Relieved now from all our anxieties, it was determined we should lay in a stock of provisions, and feast 'right merrilie.' When we quitted the town, two sheep, a basket of bread, vegetables, and an

abundance of fruit, were purchased, and marshalled by us on asses to our vessels. Scarcely, however, had they been placed on our decks, when a party marched on board, and, with their usual cry, 'Your uncle requires it,' walked off with the whole. The dervish was furious, the hadji resigned. 'Fate,' said he, 'can do no more—let us therefore quit this accursed place:' and this, with the five or six half-starved villagers we had hired for our service, we at length effected; nothing interrupting our course to a small village on the western banks, distant thirteen miles in a S.E. direction from the scene of our late disasters. The Bedowins here are of the tribe of Agyl, and are principally engaged as mercenaries in the pay of the pacha, a vocation they have followed from a very early period. Under the banners of the Moors who entered Spain, they are said to have greatly distinguished themselves, and those who returned to their own country brought with them tales of their conquests and the vanquished, which are still repeated by their descendants."

We quote another specimen:—

"I paid a second visit to Damascus some months after the former, and found a considerable change had taken place in the politics of that city. For many centuries it had stontly withstood the impost of any taxes, when Selim Pacha was directed to replace my old friend (who proceeded to India), and, as the price of his appointment was to carry into effect certain *ad valorem* taxes, a rebellion was the result, and Selim took shelter in the castle where he was starved, for the time, into an abandonment of his designs. It was, however, but for a time, for he had no sooner collected together a party, than he again endeavoured to enforce the same measures. Nothing less now than his life would satisfy the infuriated townsmen, and one morning they rose simultaneously, and marched to his dwelling. Selim and his adherents defended themselves bravely; one by one his followers fell, until at length he was left alone; retiring then to a small apartment furnished with a massive door, he for a long time resisted the utmost efforts of his foes to force it. Here he continued to fire through one of the apertures until twenty-three are said to have fallen by his hand; his bullets were now expended; collecting, therefore, all the powder (it was in a magazine) into a heap, he placed upon this his cushion, and there seated himself to await the moment when they should force the door. By the aid of fire, this they at length effected—it burst open. 'Benim' (enter), said the pacha, coolly turning his pipe over on the powder, and in an instant he and some hundreds of his foes were blown to pieces. The matter was now ended, and on the following morning the mutilated fragments of the pacha's corpse were very diligently sought for. Some were found, and being placed in a coffin, were then borne, followed through the city in great pomp by the inhabitants, to without the walls, where it was buried with every decency and solemnity. 'Singular,' said I to an old Arab, who was relating this to me some months afterwards, 'that you should thus first murder a man, and then subsequently pay so much honour to his remains.' 'You speak,' said he, 'as one whom the Prophet hath not enlightened. Is it not written in the blessed book, that with the approach of death all hatred should cease?' I have already mentioned the fray I got into during my first visit to this city; I encountered far more risk on my second. During my stay at Tyre, not knowing of the late disturbances, I had agreed

with another gentleman to return and pass some weeks here; scarcely had we entered the city, than from our dress, which unfortunately resembled that worn by the instructors in the Egyptian army, we were pronounced to be spies; at first we heard their suspicions breathed in whispers; a crowd soon collected and followed to watch our movements. My friend, poor Langton (now alas! no more), suggested that we should at once face about and declare who we were. We did so, but in an instant were torn from our horses, and a fierce debate arose whether or not we should be put to death on the spot. Fifty swords were unsheathed in an instant to put this into execution, when it was suggested that it would not be proper that the streets of the holy city of Damascus should be polluted by the blood of such 'foreign swine,' but that we should be led without the town and there stoned to death. This party bid fair to carry the day, for after about an hour's debate, we found ourselves hurried along in that direction. Death I had faced too often to feel otherwise than a Christian and a soldier at its approach; still there was something in being thus led forth by these stern fanatics, to die the death of a dog, which required no common energy with the dignity of a man to meet it. Neither Langton nor myself, however, spoke a word; at first he had drawn a pistol from his girdle, but, at my most earnest entreaty, had thrown it from him. There was one man with a florid complexion, light grey eyes, and white mustachios, who had bared his arm, and with delight expressed on his countenance, was amusing himself with brandishing with naked arms the usual crooked dagger which the Arabs wear, as near as he could without actually wounding us in our faces. At length we arrived at an open spot, and two stakes were sent for and driven in the ground. Already with cords in their hands had they approached to bind us to them, when an old Moolah, with a venerable white beard, advanced and called for silence; in an instant all was hushed. 'You seek,' said he, 'the lives of these men because you apprehend they are spies from the Egyptian army; but,' raising his voice aloud, 'is there no one here who recognises,' pointing to me, 'Khalil Aga, the Englishman, and friend of Mustapha Pacha, our late governor?' Fortunately for me, I had been well known there: several stepped forward and identified me. It was now my turn to speak. I said but little, merely intimating that the English and French were now, as ever, a distinct people, that we had no connexion with them, or with the Egyptian army, but that we were two English gentlemen, under the protection of the British resident, and as such, although we were but two, and that our lives might be taken with the same facility as they might crush a fly, yet I bid them remember we were of a nation that would exact an ample reparation for any injury that might befall us; that, in fact, for every hair of our heads would a life be demanded. I believe my words, added to the Moolah's, produced some effect, for the mob began gradually to steal off, and left us alone with the Moolah and his party. 'This is no place now for you,' said he; 'they have but to meet some opium-eating fanatic, and he will bring them quickly back, therefore mount these horses,' bidding two of those near him to get off, 'and ride for your lives; the money for them you can transmit me from Tripoli, the amount I leave to you.' We pressed the hand of our kind and venerable friend, and were soon away in the

direction of Tripoli, with all the speed we could gain from our horses. I was not displeased to hear, some months after this event, that Damascus had fallen before Ibrahim Pacha, and that Christians now enjoy the same respect within the walls as in other parts of the East."

Such is the staple of Mr. Ormsby's revelations, which, it must owned, contribute more to our entertainment than to the supply of information respecting these countries. Of useful remark, &c. we shall speak in our next.

*Stephen Dugard, a Novel.* By the Author of "The Five Knights of St. Alban's," "Nubilia," &c. &c. 3 vols. 12mo. London, 1840. Bentley.

THERE is much of talent and originality in this work. The story is well connected and well told; and though the incidents partake of the melodramatic, we really see so many extraordinary things in actual life, that we begin to doubt whether the marvellous or the commonplace ought to be considered the exception to the rule. The first two volumes merit most approbation; for the third contains such minute descriptions of appalling murders that we cannot say we are gratified by supping so full of horrors. Elsewhere we have stated that we never destroy our readers' relish for *dénouement* by previous intimation of the intricacies of plot, and, therefore, we shall select as examples of this production a few of the passages which, we think, fully sustain our favourable opinion of it:—

"It is commonly said listeners never hear any good of themselves; and the notion has been propagated, no doubt, from the laudable desire to deter over-curious persons from hearkening to what their friends may chance to say of them. But would not listeners very often hear what is good for them? Doubt it not. Our best friends are never so candid, our worst enemies never so explicit, as when they wait till our backs are turned."

Here is the portrait of a vastly agreeable woman, who acts a prominent part in this drama:—

"Sanguinary, irascible, vindictive, Jennet McBlee never made an enemy and forsook him willingly until she made him a sacrifice. Capable in herself of all crimes, all crimes found in her a head to contrive, a hand to assist, a tongue to conceal. The common property of the crew she herded with, the companion of their orgies, the witness of their deeds, the slave of their humours, the victim often of their ferocious passions, every vestige of what is distinctively woman in heart, mind, feelings, and affections, was utterly blotted from her soul. She would outswear the most blasphemous, outlie the most perjured, outwit the most crafty, outbrawl the most quarrelsome, or outface the most shameless. Yet a soft tongue and a smiling lip could lead her as gently as the bridegroom leads his bride; but cross her, and the chafed hyena is not more fierce, till a smooth phrase, a blithe look (and sometimes a bottle of Scheidam for her own locker), appeased her fury. Kilvert was the only one who could always manage her; partly because he was a favourite,—partly because he never flattered or reviled her,—but most of all because he had that in him with which she knew it dangerous to trifle, added to a certain quality of command that received obedience as a due rather than enforced it as a right."

We have said that the repetition of murders has somewhat revolted us, but there is a painful force in the accounts which rivets the mind.

For instance, the assassination of two witnesses on their way to give evidence. The murderers "continued their route till they came within five or six miles of Black Rock, and then entering a wood, of nearly two miles in extent, for the purpose of avoiding the main road, Kilvert ordered them to halt. The natural gloom of the place was increased by the approaching shadows of evening; and, to Stephen's imagination, by the work they had in hand. 'Here let it be done,' said Kilvert. Black Kenneth was the first to begin. Fastening his horse to a tree, he took one of the spades, and proceeded to dig in the spot pointed out by Kilvert. Grim Lawrence followed, and every one in turn was called upon to lend a hand, Stephen and Mayfield relieving Kilvert and Mat Henwick. In less than an hour a grave of several feet deep was excavated; and into it the body of Rutherford was thrown, together with the bloody cloth which covered it. But now came the more terrific scene of this awful drama. Kilvert, without speaking a word (and the same profound silence was maintained by all), collected the pistols, which he placed upon the ground, and then, taking off his own coat, spread it over them. They were laid completely out of sight, behind the mound of earth which had been thrown up in digging the grave. 'Now,' said he, when every thing was ready, 'it shall not be thought I have a better chance than the rest, as I mean to be the first to draw. Come here, squire,' beckoning to Stephen, who advanced with a faltering step. 'Let me bind this handkerchief over your eyes, and then Mayfield shall lead you to the pistols. Change the position of every one, but without lifting the coat, or putting your hand under it. You cannot then place your own where you can find it again, nor can I know in what order they will lie.' This was accordingly done. After which, Kilvert, with his eyes bound, was conducted to the heap. He drew forth one, and stuck it in his belt. Stephen shook in every limb when it came to his turn. At length there remained only the last; and then, upon examination, it was found that no one had drawn his own. Whose, then, was the last? Black Kenneth's. He took it up, cocked it, and went towards the miserable being whose very minutes were now counted. 'Stop!' exclaimed Kilvert. 'Give him time to say his prayers if he is able.' Poor wretch! He had slept away the fumes of the treacherous drink sufficiently to know all the horror of his situation; to know that his grave was yawning before him; and that he was on the brink of eternity. He awoke under the rough grasp of Kilvert, who untied the cords with which he was fastened, and stared wildly about him as he was dragged off the horse. The first word he uttered was the name of his companion, friend, and fellow-servant. 'You are to die!' said Kilvert. He had reeled before, as he endeavoured to gain his numb legs; but, at these words, he suddenly stiffened into an attitude of pallid horror. There was light enough to see the band by whom he was surrounded, and the dark grave at his feet, and the blood-beameared features of his companion lying in it. 'I am here to die!' he exclaimed in a voice scarcely articulate. 'For what?' 'It concerns you more to know that you are to die than to know for what,' replied Kilvert. 'If a minute will bestead you to send up a short prayer to Heaven, use it so; if not, prepare.' He dropped upon his knees, and, with frantic gestures, implored them to spare his life. At this moment

Bli Gonzalez approached behind, and, slashing his knife across his eyes, exclaimed, 'Ned Dymar sends you that!' The shriek of the wretched man was frightful. He fell upon his face, when black Kenneth stepped up, dragged him close to the edge of the grave, supported him with one hand in a half-erect position, with the other directed the muzzle of the pistol close to his heart—fired—let go his hold, and the mangled body dropped upon that of Rutherford! Whether he was quite dead they did not trouble themselves to ascertain. The next minute they set to work, and filled up the grave. It was a scene fraught with horror. The shriek of the murdered man, as Gonzalez wantonly mutilated him—the startling echoes of the pistol-shot through the surrounding forest—the heavy, sullen sound of the body as it rolled into the grave, and the stifled death-groan which faintly followed the ball that pierced the heart—still rung in the ears of Stephen, who had shrunk trembling behind Kilvert, unable to look at the bloody business. He felt he was a murderer! What that feeling is, in the freshness of its first awakening, there is no form of speech dark and terrible enough to express."

We now copy a brief but fine sketch of a good character:—

"He was, indeed, one of those characters which it might almost be thought Nature had intended for some purer sphere, but, escaping from her hands, had accidentally wandered into this. All his feelings, all his opinions, partook of this origin. They were not derived from the world, and were scarcely applicable to it. His morality was not of that elastic kind which adapts itself to the dimensions of the offender. Vice was vice with him, unchanged and unchangeable, whether clothed in purple or rags; whether it betrayed itself in his dearest friend or most despised enemy. He laughed at the prostitute virtue which dwells only on a glib tongue. Yet he was no day-dreamer, no seeker of visionary perfection; he did not expect the brightness of heaven in the dim ways of the earth. Nevertheless, though he was content to take man as he is, with all his capacity for what is noble, and all his proneness to what is vile, he was every hour disgusted to observe how he cast the former behind, and wallowed gratuitously in the latter."

Altogether, *Stephen Dugard* possesses character and interest to recommend it to readers who love these ingredients; and mixed up, too, with a tale of considerable excitement.

*A Summer in Brittany.* By T. A. Trollope, Esq. B.A. Edited by Frances Trollope, author of "Domestic Manners of the Americans," &c. 2 vols. 8vo. London, 1840. Colburn.

ONE would think that an individual who had advanced to the degree of a Bachelor of Arts, and had rambled through a foreign country for months away from the protection of his mother, might have written an account thereof without calling in the aid of mamma. Mr. Trollope, however, with becoming diffidence and filial piety, having deemed it proper to invoke that assistance, we can have no fault to find with the name of his able and distinguished parent on the title-page of his book.

That book, no matter how concocted, offers much of agreeable and interesting matter, but has the fault of dwelling too much on indifferent details. Every day's movement of a pedestrian even through *terra incognita* would be too much, and when his route lies through more frequented places the descriptions become same and tedious.

With this one objection, we can truly state that there is much in these volumes to entertain the reader, and in proof select the following passages, without caring for introduction or order. Our review is, indeed, a mere miscellany relating to Brittany.

*Fair-day among the Bas-Bretons at Collinée.*

—“With their immense black hats, their long streaming hair, and quaint square-cut coats, they looked more like men belonging to some forgotten century than aught that could be living in the present age. They were dressed almost invariably in cloth of a reddish-brown, something between a claret and chocolate colour. Business of all sorts was going on briskly. Here, a restive little cow, with its owner, holding tight a short rope attached to its horns, would push the crowd right and left in their progress through the street at a good round trot, the result of the cow's strong desire to run away at a gallop, and her master's equally strong wish to proceed at a sober walk. There a woman was beating a drum, to call the attention of the public to a large collection of human teeth, which her husband, the doctor, professed to have extracted with the utmost skill; an operation which he was again ready to perform for those who needed it, for the consideration of one sou. In another place, an itinerant haberdasher, with his whole stock of tapes, bobbins, &c., tied to the end of a long pole, from which they depended in many a tempting festoon and long streamer, held his wares high above the heads of the gaping crowd, whom his eloquence, Autolycus-like, had collected round him; nor did he lower his rod, so that the eager hand of the purchaser might reach and select the desired article, and pull it from its moorings to the bunch above, till he had fairly secured the customer's sous beforehand. There were plenty of quack-doctors offering remedies for every ill that can afflict man or beast, and several vendors of crucifixes, rosaries, little waxen saints and virgins, and similar trumpery. But what surprised me more than all, by the singularity and novelty of the thing, were the operations of the dealers in hair. In various parts of the motley crowd there were three or four different purchasers of this commodity, who travel the country for the purpose of attending the fairs, and buying the tresses of the peasant girls. They have particularly fine hair, and frequently in the greatest abundance. I should have thought that female vanity would have effectually prevented such a traffic as this being carried on to any extent. But there seemed to be no difficulty in finding possessors of beautiful heads of hair perfectly willing to sell. We saw several girls sheared one after the other like sheep, and as many more standing ready for the shears, with their caps in their hands, and their long hair combed out and hanging down to their waists. Some of the operators were men and some women. By the side of the dealer was placed a large basket, into which every successive crop of hair, tied up into a whisp by itself, was thrown. No doubt, the reason of this indifference to their tresses on the part of the fair Bretonnes, is to be found in the invariable ‘mode’ which covers every head, from childhood upwards, with close caps, which entirely prevent any part of the hair from being seen, and of course as totally conceal the want of it. But at least, thought I, it is a comfort to find that these poor girls possess, and can turn into money, an article which must be worth a sum of considerable importance to them. I inquired, and learned afterwards, the terms upon which a girl submits her head to the shears; and how much does the reader

guess is the price thus secured as a little dowry? The highest value given by these abominable hair-merchants is twenty sous; and the more usual consideration by far is a gaudy, but trumpery, cotton handkerchief, worth about twelve or sixteen sous, of which these gentry carry about with them a stock for the purpose. The profit thus netted by these hair-mongers, during a tour through the country, must be enormous. As in similar scenes elsewhere, so in Brittany also, as the business of the fair grew slack, the fun grew thick; and, as this fun consisted almost entirely in drinking, the whole village became, as night drew in, one motley scene of noise and confusion. Preparations, both for eating and drinking, were by no means confined to the houses. Numerous fires, shewing themselves and the figures of those around them with most picturesque effect in the rapidly increasing darkness, might be seen along the sides of the streets, with each its presiding deity, in the shape of an old crone, preparing some savoury, richly steaming dainty. The cooking apparatus was a very simple one; merely a large circular iron plate, some twenty inches in diameter, supported over the fire on four legs. On this were placed the various tempting morsels—a few sausages, or a scrap of bacon, or, perhaps, even a choice atom of ‘jambon’—which first seduced the passers-by themselves, and then leading, like all temptations yielded to, from one to another, served as ‘shoeing-horns to draw on a pot of’ cider. This favourite beverage was found at every turn. Innumerable hogsheds, each on the tap in the little cart that brought it, were sold out to the last drop by their proprietors, and the quantity consumed must have been prodigious. In the houses, the more expensive luxuries of bottled beer, *café noir*, and brandy, were not spared. Both within and without, as more and more by degrees the liquor got uppermost, the Babel roar of tongues became tremendous. Several *gend'armes* were patrolling the village continually; but, though the most vehement abuse and most energetic scolding were abundant, no blows were struck, the contending parties, in every instance that I witnessed, confining their warfare most scrupulously to taunts, invectives, and the most frantic gesticulations.”

Further on we are told:—

“In the more remote parts of the country we never found any charge made for beds. Our accommodation at Collinée certainly was not worth any very large sum; but I have slept in many an excellent bed without any charge being made, or the least expectation on the part of the hostess of receiving any thing. Sometimes, in inns of rather superior pretensions, it was hinted, that if we liked our beds, ‘*la bonne*’ would be grateful for any small mark of our approbation.”

Cannot the following be nearly matched—Ireland?—

“We learned, in the course of the evening, that there was to be a large ‘pardon’ on the morrow, at Pleyben, a little town about six miles south of Braspars. In Brittany, a ‘pardon’ is equivalent to a wake in England, a ‘*fête*’ in France, or a ‘*keremese*’ in Flanders. It is the village festival, and usually takes place on the day consecrated to the patron saint of the parish. Like every other circumstance in the life of a Breton peasant, these pardons are connected with religious observances; and the term arises from the idea that certain ceremonies then and there performed by the frequenters of them obtain a certain pardon for their sins. These pardons have very different aspects at different places. In some villages,

where there happens to be a celebrated relic, or where any peculiarly popular saint presides, the pardon has retained its religious character and features. But in others it has become a mere village festival, celebrated generally by observances any thing but religious, and considered, even among the peasants themselves, as meetings which the young, especially of the more tender sex, should not be over-anxious to attend too frequently. It can hardly be necessary to remark that this caution on the part of the old folks scarcely occasions any pardon to be unattended by the far greater part of all the lads and lasses in the neighbourhood. They are decidedly of opinion that, if their seniors are virtuous, that is no reason that there should be no more cakes and ale. Nor does it often occur that any thing worse than a day's idleness, and perhaps a taste for dissipation, ensues to the young ‘*paysannes*’ at these rustic merry-makings. The gallantry of the rural swains is rarely carried to any very dangerous lengths; and if a *faux-pas* be made, it is generally mended by a marriage. A deliberate and practised seducer would be visited with the general indignation of the country to the full as heavily as the victim of his treachery, and a rustic Don Juan would soon find himself driven forth from among the primitive society of this old-world country. It must be clearly understood, however, that these remarks apply only to the rural population of the villages. That of the towns, I have reason to believe, is, in this respect, as in others, profoundly immoral. And in the immediate neighbourhood of the largest, it is, I conceive, by no means rare, for the ignorant, unsuspicious, young *paysannes* to become the victims of systematic seducers. The period of maidenhood is, among the Bretons, that of freedom, gaiety, and amusement. Their habits and ideas, in this, as in some other points, resemble ours much more than those of the French. A French writer on Breton manners remarks that one thing only is wanting in Brittany to render this as harmless there as it is in England—videlicet, a ‘Breton Gret-na-Green!’ It is infinitely amusing to find that our neighbours consider the privileges to be there obtained by fugitive couples as the safety-valve, which alone renders innoxious the freedom of our manners. But if the young women of Brittany consider the years before marriage to be those of enjoyment, of pleasure, and in some degree of license, they look forward to that great event as the certain close of all life's lighter and gayer pleasures. The marriage state is looked upon as one of privation, of submission, of care, and of labour. Even the stronger vessel looks back with some degree of regret upon the easy carelessness of life, which at his marriage he is about to lose for ever, and contemplates, with sombre seriousness, and almost with misgiving, the duties, the cares, and the responsibilities, he is going to undertake. These sentiments are manifested in an extraordinary and interesting manner in the songs of the bride and bridegroom commonly sung at marriage festivals. M. Souvestre has translated into French a specimen of that of both the man and the woman. The latter is, as might be expected, the most true and the most touching; and I will, therefore, content myself with translating that only. It will be sufficient to shew the feelings with which marriage is contemplated, and the poetry with which their language and warm imaginations can describe them.

*The Song of the Bride.*

“In other days—in the days of my youth—how warm a heart I had! Adieu my companions, adieu for ever!”

"I had a heart so ardent! Neither for gold, nor for silver, would I have given my poor heart! Adieu, my companions, adieu for ever!"

"Alas! I have given it for nothing! Alas! I have placed it where joys and pleasures are no more. Adieu, my companions, adieu for ever!"

"Pains and toil await me. Three cradles in the corner of the fire! A boy and a girl in each of them! Adieu, my companions, adieu for ever!"

"Three others in the middle of the house! Boys and girls are there together! Adieu my companions, adieu for ever!"

"Go, maidens! run to fairs and to pardons! but for me I must do so no longer! Adieu, my companions, adieu for ever!"

"For me, see you not, that I must remain here! Henceforward I am but a servant, girls; for I am married. Adieu, my companions, adieu for ever!"

Such, among this singular people of sombre and gloomy temperament, is the song of the bride, sung in the midst of the nuptial festival and revelry. Its effect upon the company assembled is extraordinary. The melancholy silence which follows it is broken only by the sobs and cries of the women. For they know that the young bride's description of married life is just, and their tears flow for themselves as much as for her. The grand occasion and scene of all those pleasures to which the young wife so affecting bids adieu is the village pardon. That is the great opportunity for love-making and courtship, and dancing and finery, and laughing with her equals and companions, and all that a young girl best loves. All the *beau-monde* of Brasparts was going to the pardon at Pleyben the next morning; and we determined to go too, though our intended route was exactly in a contrary direction towards Morlaix."

Another picture of the country will please the reader; and with it we conclude:—

"I met at Quimper, in Finistere, an old colonel, who pointed out to me, in the market of that town, men in the dress of peasants, who had been through all Napoleon's campaigns, and had risen to the rank of captain in the army; but who had in every respect returned to the manner of life of peasants, the instant they were able to retire, and return once more to their native communes. Their locks, as many as time had spared, were once more suffered to stream over their shoulders; they adopted the peculiar dress of the peasants in that part of the country; and most of them endeavoured to forget the language they had been compelled so long to use, or, if that were impossible, at least refused to speak it. These circumstances may give the reader an idea of the light in which the conscription is viewed in this part of France; and the anxiety of the poor old farmer of Tregastel for his son's return will be easily understood. When we at length quitted his hospitable though lowly dwelling, he insisted upon accompanying us to Tregastel to shew us the way. We passed on the road another old man, ragged and filthy, basking in the sun under a rock, an admirable picture of a Breton Silenus. He accosted us, and perceiving that we did not understand him, made signs, which we understood to imply a request that we would bestow on him where-withal to buy food. But our guide explained to us that he was inviting us to come and eat at his house, and told us that he also was a farmer, and proprietor of the little bit of land he cultivated. We declined his invitation, on the grounds of having just partaken of his neighbour's hospitality; and, as the steeple of Tregastel was now visible on the top of a slight hill before us, we bade adieu to our kind guide, and left him talking to his neighbour. From Tregastel we walked in a southern direction towards the site of one of those large and famous cities, of which such frequent mention is made in the old Breton legends.

It is between Lannion and the mouth of the Guer, that immemorial tradition has fixed the site of the ancient city of Lexobia. It is a very curious thing that no less than five or six opulent and flourishing cities are spoken of as having existed in ancient Armorica, which have perished from the face of the earth, and left no trace of their ruins upon the soil. Of the famous cities of Ys, Tolente, and Occismor, the mere name survives. The sites of their former existence even are doubtful, and a fruitful subject of dispute to the Breton antiquaries. Of Lexobia, indeed, it is said that certain foundations of walls and the entrance to a vault may yet be discovered at a spot near the village of Coz-Gueaudet, and that these are sufficient to fix with certainty the position of the town.

"A Breton can rarely be said to be 'over-taken by liquor;' for he almost invariably enters upon a drinking bout with the full intention and purpose of getting drunk. It is the only enjoyment he knows; and the only temptation which induces him to swerve from the rigid economy which regulates his usual mode of life. It is the vice not of any particular age, profession, or sex, but of the nation. A fond father teaches his child to get drunk; and does so himself, in company with his wife and family. The first lesson in drunkenness usually accompanies the first donning of the manly 'bragon-bras.' The father or elder brothers make it a point to celebrate this auspicious event by plying the child with brandy till it drops senseless. Sometimes a whole cart-load of human beings, consisting of one entire family, old men, young men, women, and children, father, mother, sons, and daughters, may be seen returning from the town dead drunk together; having been there for the express purpose of becoming so, fixed beforehand and determined on, and looked forward to as a party of pleasure. I never have myself seen such a party as is here described; but I make the statement on the authority of M. Souvestre, who, in his notes to Cambry, asserts that he has; and much that I have seen leads me to believe that his picture is not exaggerated. It is odd that the sacred plant, the mistletoe, should be selected as the sign of the scenes of such excesses. For the name by which it is known among the peasants seems to indicate that the old idea of its sanctity has not been lost, though, as in so many other cases, it has been connected with a new object. They call it 'touzou ar groas,' the herb of the cross,—an appellation which, no doubt, was given by the early teachers of Christianity, with a view to transfer the veneration paid to it to the cross, which they very probably decked with boughs of it."

#### *The Early History of Freemasonry in England.*

By James Orchard Halliwell, Esq. F.R.S. &c. Pp. 45. London, 1840. Rodd.

THIS is a very curious little book, and well deserves the attention not only of the antiquarian, but of every one interested in the history of the manners and customs of our forefathers during the middle ages. Freemasonry is a mysterious subject, and its antiquity in the sense we now give to the word might easily be made a matter of long, and, probably, unsatisfactory discussion. The singularly interesting poem which Mr. Halliwell has here brought to light can hardly be considered as a monument of freemasonry, but it contains allusions to legends and other things which were at a later period more or less interwoven with that brotherhood.

We know how the members of the different trades and crafts in the middle ages formed themselves into incorporate companies, for the sake of mutual protection and aid. The poem printed by Mr. Halliwell from a MS. written in the fourteenth century, contains the rules to be observed by the craft of masons, which it states to be the "moste oneste craft of alle." Masonry is here stated to be otherwise styled geometry, and to have been invented by Euclid "yn Egypte," to occupy the time of the children of lords and ladies, that they might not remain idle. The craft came into England in "good Kynge Adelstonus day," who—

"Made then bothe halle and eke bowre,  
And hys temple of gret honowre,  
To sportyn hym yn bothe day and nyght,  
And to worchepre hys God with alle hys myght."

The "constitutions" which compose the main part of this poem, relate to the qualifications and behaviour of the "mayster masons" and of their apprentices, and some of them are very remarkable. The master mason is admonished to take no bondman for an apprentice;—

"For the lord that he ys bonde to,  
May facie (fetch) the prentes whensover he go."

The master masons are strongly warned against supplanting each other, or interfering in each other's work. Other articles forbid them to work at unseasonable hours, or under the regular charges. Another injunction to the mason is expressed as follows:—

"Thou schal not by thy maystres wyfe ly,  
Nor by thy felows, in no maner wyse,  
Lest the craft shold thee depys;  
Nor by thy felows concubyn,  
No more than thou wolddest he did by thyme."

The last clause does not speak much for the morality of the fourteenth century. It is also worthy of remark, that the master mason is directed to pay his men for their wages in proportion to the price which food produced at the moment:—

"And pay thy felows after the coste,  
As vytales goth thenne, wel thou wost."

In the introduction to this poem, Mr. Halliwell has given an abstract of the curious legends connected with the supposed origin of geometry and masonry; and the tract closes with some interesting observations on the antiquities of what we now understand by the name of freemasonry. It is a tract which we can safely recommend to our readers.

*Ystradfin, a Descriptive Poem; with an Appendix, containing Historical and Explanatory Notes.* By Mrs. Bowen. Post 8vo. pp. 189. 1839. London: Longman and Co. Llandovery: Rees.

THIS poem (with such an unpronounceable name, that if we went to the publishers' we should almost be afraid of asking for it) is an attempt to describe the beautiful scenery of South Wales, and is for the most part done in a very ladylike and elegant manner. It also contains a few slight sketches of ancient Welsh manners and customs, and ends with a very melancholy love-tale, which is, however, very sweetly told. The fair authoress has not brought clearly to our view the pictures of mountain and valley, the deep winding road, the grey ruin, moss-covered rock, and headlong torrent. She hurries along too rapidly, and dashes her colours about with too careless a hand to leave behind those faithful and striking impressions which bring the scenery at once before the eye. In a word, and in plain English, it is a failure. The work she has set about does her great credit for the intention, but the execution required the hand of a genius, and genius is

now a rare quality amongst our new poets. The beauties of Wales have yet to be reflected in poetry, although in the present volume they are as well described as other scenes have been in similar works, for the book is not unreadable; as a proof, try the following extract:—

"So still their rambles they pursue  
With lofty Dinas full in view.  
The crumbling rock, with moss o'ergrown,  
The crystal streamlet trickling down,  
The rushy swamp, the crisped heath,  
Crackling the hasty foot beneath;  
All these are past! before them lie  
The scathed rock's rude majesty.  
Masses immense, promiscuous hurl'd,  
Speak the convulsions of a world,  
Which sequent centuries have drest  
With shrubs, and herbs, and mossy crest.  
And now a rifted rock is high,  
Yawning before the wand'ring eye,  
Whose broad dark sides on either hand,  
Like high embattled ramparts stand,  
With careful steps they upward wind,  
And soon a narrow entrance find,  
That just admits them one by one,  
With form convolving to the stone.  
Lofty, though narrow, is the cave,  
And o'er its top wild branches wave,  
And on its tall sides, smooth and bare,  
Full many a carved name is there!  
Names of the present and the past,  
Which thus beyond their date would last."

## MISCELLANEOUS.

*Truth, what is it? and Opinion, what is it not?* Pp. 180. (Edinburgh, Fletcher.)—A metaphysical treatise, principally on taste, and of considerable talent and originality. Using his sense in appreciating our present nature and condition, it may truly be said of the author that he "allures to brighter worlds."

*Early Days in the Society of Friends, exemplifying the Obedience of Faith in some of its First Members.* By Mary Ann Kelly, author of "Straightforwardness." Pp. 471. (London, Harvey and Darton.)—The writer has collected together a good deal of what we have read in earlier biographies, concerning George Fox, E. Burrough, Howgill, Isaac Penington, David Barclay, William Penn, and other worthies with whom the Society of Friends sprung up and flourished. The strange character of the times in which they lived, and their own remarkable doings and sufferings, exhibit much curious matter.

## ARTS AND SCIENCES.

## ROYAL GEOGRAPHICAL SOCIETY.

MAY 25. Mr. Greenough, F.R.S. President, in the chair.—This being the ninth anniversary meeting of the Society, the annual report of the Council was read, which stated that sixty-seven new members had been elected, and twenty-five vacancies had occurred during the past year; and that the Society now consisted of 697 members, exclusive of foreign and corresponding members. At the evening meeting, the President delivered his anniversary address, and presented the two gold medals, constituting the royal premium for the advancement of geographical science and discovery, awarded respectively to Mr. R. H. Schomburgk, and Major Rawlinson, of the Bombay army, in the following terms:—

"Mr. Schomburgk,—By favour of her Majesty, the queen of these realms, the Royal Geographical Society is authorised to apply the medal now before me to the encouragement of geographical science and discovery; and it is in the conscientious discharge of the duty which has thus devolved upon them, that the Society has determined to place in your hands this honourable testimony of their approbation and esteem. Sir, in the arduous journey in which you were engaged during a period of five years, you faithfully complied with the instructions, and more than fulfilled the expectations, of your employers. Guided in the first instance by the footsteps of your illustrious countryman, Baron Humboldt, you afterwards visited a country in which no one had preceded you. An

"The entrance to this cave is through a narrow aperture formed of two immense slate rocks, which face each other, and the space between them is narrower at the bottom than at the top, so that the passage can only be entered sideways, with the figure inclined, according to the slanting of the rock."

important problem which he began to solve you have brought to its conclusion; and, by your joint observations, we have now astronomically determined a connected series of fixed points along a line extending from the Atlantic to the Pacific. Nor is it in this respect only that we recognise the qualities of your great predecessor. Like him, you are distinguished by the variety of your talents and the extensive range of your studies. The zoologist gladly recognises in you the discoverer and describer of several species of birds and fishes; the botanist, of many plants before unknown to naturalists. An account of your geographical observations, given in the order of their occurrence, is reported in our 'Journal;' and, in the work you have since published, and in which you develop the great and unexpected resources of British Guayana, you have rendered an important service to those of our countrymen who hold property in that colony. The map which you have constructed, and which the Society is about to publish, bears ample testimony of your ability as a physical geographer. The able and affecting appeal which you have made in behalf of large tribes of our fellow-men and fellow-subjects, with whose merits and sufferings we were previously unacquainted, has not been made in vain; and you are now about to return to the land of your former wanderings under the sanction of the government, not only to enlarge the boundaries of science, but to secure the interests of this country, and to vindicate the rights of humanity. We are well aware of the labours you underwent in your former journeyings—the privations you suffered, the perils you encountered: and in admiring that patient endurance, that undaunted spirit, that determined perseverance, of which we find in your late expedition such abundant proofs, we feel justified in entertaining the confident as well as earnest hope that, after the successful accomplishment of your new mission, you will return among us crowned with additional honours, and possessing still higher claims to our gratitude and respect."

Mr. Schomburgk, in reply, said,—

"Sir,—The distinction which the Royal Geographical Society enjoys among the scientific bodies in Europe, and the lead which it has hitherto taken in the advancement of geography, must render so honourable a testimonial as you have just now bestowed upon me a proud acquisition to any traveller; the more when he looks back to the distinguished travellers and discoverers, who, at a former period, received from this chair the royal premium. But to me it is an additional source of gratification, as it proves to the world that the researches which were carried on under the patronage and direction of this Society met with their approbation. I may, perhaps, be permitted briefly to recapitulate some of my labours in the West Indies. In the year 1831, I executed a survey of Anegada and its dangerous reefs, by which, I trust, I have been the means of saving the lives of many of my fellow-creatures, and several vessels, from shipwreck. This survey brought me into connexion with the Geographical Society, and I subsequently, as related in its 'Journal,' explored the rivers Essequibo, Corentyn, Berbice, and investigated the capabilities of the rich and fertile colony of British Guayana. One of my discoveries during that period was the *Victoria Regia*, the most beautiful specimen of the flora of the western hemisphere; and it gives me much pleasure to announce to you, on this occasion, that after three vain attempts to convey living

specimens of this plant from the interior to the coast, I have just received information that five plants have arrived in good order in George Town, Demerara, and I hope will shortly reach England. I need scarcely say, that the first specimen that arrives will be placed at the disposal of her majesty, who has so graciously permitted this flower to bear her name. My subsequent journey to Esmeralda, the details of which have been communicated to the Society, enabled me to connect my observations with those of Baron Humboldt; and I am proud here to state, that it was the example set by that distinguished traveller that has led me onward through difficulties and privations of no ordinary nature, till I had the good fortune to accomplish the journey that you have been pleased this evening to crown with your approval. For myself personally, I do not feel that I have a claim to this high honour; let me, however, consider it as an encouragement to future exertions, and, although the path marked out for me at present in my future travels in Guayana is restricted to the limits of the colony, I confidently trust that I may obtain permission to extend them to the eastward, and also that I may make another attempt to the westward to reach the source of the Orinoco, by ascending the rivers Mocajahi and Catrimani. To you, Sir, as President of the Society, I beg to offer my sincere thanks for the too-flattering terms in which you have conferred this distinction, which I shall ever consider as one of the proudest events of my life, and I trust that my future researches may prove me to have been not wholly unworthy of it."

The Chairman then turning to the late President of the Geographical Society of Bombay, said:—"Admiral Sir Charles Malcolm, in awarding to Major Henry Creswicke Rawlinson, of the Bombay army, the Founder's medal for the year 1839, the Council of the Royal Geographical Society have been guided, not merely by the zeal, perseverance, and industry with which that officer has successfully explored the provinces of Luristan, Khûsistan, and Azerbaijan, and the valuable additions which, in his memoirs published in our transactions, he has thrown on our knowledge of the physical geography of that large and important portion of the mountain-ranges, which divide the basin of the Tigris from the elevated plains of Central Persia; but they have wished more particularly to give this mark of their approval and regard to the vast extent of learning and historical research which Major Rawlinson has brought to bear on the objects of his geographical inquiries. This officer has given, in the course of these memoirs, a bright and animating example of the manner in which the knowledge to be derived from books—and from books too, which, to the generality of English readers, are of the most recedite description—may be applied to objects of practical science, I mean to the improvement of our knowledge of ancient geography. Major Rawlinson has, in the course of his travels in Luristan and Khûsistan, verified various ancient routes from the Tigris, across the range of Zagros into Media; has identified the affluents of that river by a strict comparison of their ancient and modern names and courses; and has thrown great light on the towns celebrated in profane and sacred history, under the names of Sûs, Susân, Shûster, and Elymais. In the province of Azerbaijan, the original seat of the fire-worshippers of the ancient world, Major Rawlinson has given us a clear and valuable description of the eastern and southern shores of the Lake Urumiyah, and of the country between that

and the shores of the Caspian. His researches into the probable existence of two cities bearing the name of Ecbatana, one of them in Atropatene, and the other in Media Magna, have given occasion to one of the most lucid and learned essays on the comparative geography of the world which have ever adorned the pages of the transactions of this or any other Society instituted for the promotion of either natural or historical knowledge. It is on these accounts, Sir, that the Council have been pleased to award to Major Rawlinson this medal; and I need not add what pleasure I feel in delivering it into the hands of the late President of the Geographical Society of Bombay, who, from his long and intimate connexion with India, is so well qualified to appreciate Oriental research, to echo our applause, and to convey to Major Rawlinson with greater feeling, and therefore with greater fidelity, than I now convey to him, the interest which we have taken in his past, and which we shall continue to take in his future, labours."

Sir Charles Malcolm, in reply, said:—

"Sir,—I feel that the selection which you have been pleased to make of me as late President of the Geographical Society of Bombay to receive the gold medal for Major Rawlinson will be gratifying beyond measure to that Society, as it will shew to them that they stand high in the opinion of the parent Society from which they emanate, and that there is on your part the warmest feeling of good-will towards them in their efforts to enlarge our geographical knowledge in the East. To me personally it will be a pleasing duty to send this honourable token of your approbation to Major Rawlinson, accompanied as it will be by the address you have just delivered, which has so clearly and justly brought before us his merits as a traveller; because I remember him well when he was a gay, high-spirited young man, apparently thinking but little of these pursuits which have drawn forth his talents, not only as a rising politician and a soldier, but also as one of the first comparative geographers of the age. There can be no doubt that the royal premium awarded to the adventurous and eminent traveller Sir Alexander Burnes, who now stands so high above the political horizon in the East, stimulated that officer in his rapid career; nor can I doubt but that it was also, in prospect, a strong incitement to Major Rawlinson as it will be with many others; and it will be a proud feeling for the Geographical Society of Bombay to see two of their members receive this honourable mark of your approval. In speaking of that Society, it affords me great pleasure to have an opportunity of bearing my public testimony to the exertions of its able and learned Secretary Dr. Heddle, to whom the Bombay Geographical Society is chiefly indebted for the position which it now holds; and I may here mention that another member of that Society, Lieutenant Wood, of the Indian Navy, is now in London preparing for publication his account of his journey into Khundúz, and to the sources of the Oxus; an outline of which he will give to the Society at its next meeting. In conclusion, I cannot but repeat my conviction, that the award of this evening will be a great encouragement to future labourers in the cause of geography in the East; and the recent act of liberality of this Society, in presenting a complete copy of the Geographical 'Journal' to the ten principal civil and military stations in India, cannot fail to excite a corresponding exertion on the part of the officers of the

Indian army and navy. Again, Sir, I beg to offer you, in the name of Major Rawlinson, my best thanks for the distinction which this Society has awarded to him, and for the flattering terms in which you have been pleased to convey it."

#### UNITED SERVICE INSTITUTION.

MONDAY, 4th May. Evening meeting of the members, Major S. Clerke in the chair.—The following presents were exhibited:—Two ancient guns, or chambers of guns, of the time of Henry VI. of wrought iron, found in pulling down a house at Dover. Presented by Lieut. Worthington, R.N.—A model of a brig fitted with the revolving masts proposed to be used by Lieut. Molyneux Shuldham, R.N. The lower and top masts are composed of sheers, or four spars united at their apex, and revolve on a circular platform, to which the whole of the rigging is attached: the sails thus trim themselves by the action of the wind. Presented by the inventor.—A collection of Moorish articles of apparel, spurs, bridles, &c. Presented by Major E. Napier.—135 volumes of the "Encyclopédie Méthodique de l'Académie Française." Presented by Colonel W. Napier (the historian).—A model of a Welsh coracle, in which they fish for salmon, formed of tarred canvass stretched on a wicker frame. Presented by Rear-Admiral Griffiths.—A collection of Indian shells. Presented by Rear-Admiral Sir Charles Malcolm.—The following papers were read:—1. 'A Short Account of the Courbari, or Locust-tree, of St. Luci,' by Colonel H. Capadose, 1st West India regiment.—2. The first part of a series of papers 'On Heraldry,' by Wm. Berry, Esq. author of the "Encyclopædia Heraldica." Illustrated by transparencies. This introductory portion of the course was confined to the elements of first principles of heraldry, descriptive of the divisions in the shield and the characters of the honourable ordinaries. The ordinaries per fesse, per cross, per bend, per saltier, per chevron, per pale, &c. were explained and exhibited, and their origin attributed to the desire of perpetuating the numerous cuts across the shield, received in battle, as evincing prowess and achievements in hand-to-hand engagements. For instance, a cut from corner to corner originated "a bend;" from top to bottom, "a pale;" across the centre, "a fesse," &c. &c. The divisions, dexter chief, precise middle chief, sinister chief, honour point, fesse point, nombril, dexter base, exact middle base, and sinister base, were severally pointed out. The lecture was of great interest, and promised in its further development much gratification.

Tuesday, 5th May.—Mr. Pereira delivered the first of two lectures 'On the Phenomena of Polarised Light.' This interesting subject was ably treated, its peculiarities clearly developed, and its laws and effects made manifest by ingeniously contrived models, transparencies, &c. No one present could fail to appreciate the lucid exposition of the lecturer, nor to admire the gorgeous exhibitions of the polariscope; and all will at once agree with Sir John Herschel, who says that "the phenomena of polarisation of light are so singular and various, that to one who has only studied the common branches of physical optics it is like entering into a new world, so splendid as to render it one of the most delightful branches of experimental inquiry, and so fertile in the views it lays open of the constitution of natural bodies, and the minute mechanism of the universe, as to place it in the very first rank of the physico-mathematical sciences, which it maintains by the

rigorous application of geometrical reasoning its nature admits and requires."

#### LINNEAN SOCIETY.

(Anniversary.)

The Bishop of Norwich in the chair.—H.R.H. Prince Albert was elected an honorary member of the Society. The usual reports were read. The Bishop of Norwich was re-elected President: the other officers stand nearly as heretofore. Among the members deceased during the past year are the Duke of Marlborough, who was distinguished for his botanical taste, and for his zeal in the cultivation of exotic plants, and the magnificent collection formed by him at Whiteknights; the Duke of Bedford, a munificent patron of the arts and sciences in general, and especially of botany; Lord Charles Spencer Churchill; Allan Cunningham, Esq., the eminent collector, who died at Sydney last June—he was distinguished for his moral worth, singleness of heart, and enthusiastic zeal in the pursuit of science; Davies Gilbert, Esq.; Dr. Goodall, the Provost of Eton; Don Mariano Lagasca, Professor of Botany, and Director of the Royal Botanic Garden at Madrid, Spain, long famed as the granary of ancient Rome, is known to surpass all other countries in the great variety of those grasses which are cultivated for human food, such as the wheat, barley, rye, and oats: all botanists will remember the extensive and interesting collection of Spanish *Cerealia* cultivated by Professor Lagasca in the garden belonging to the Society of Apothecaries at Chelsea. Among the foreign members, the Society has lost two distinguished names,—Professor Blumenbach, of the University of Gottingen, and Professor Jacquin, Director of the Imperial Gardens at Schœnbrunn, near Vienna. Seventeen fellows and four associates have been elected since the last anniversary. The report of the auditors was very satisfactory. The thanks of the Society were voted to Dr. Booth on his retirement from the office of Secretary; John Joseph Bennett, Esq. being elected to the office. In the evening of the same day the fellows and several friends of the Society dined at the Freemasons' Tavern.

#### PARIS LETTER.

Academy of Sciences, May 26, 1846.

SITTING of May 18th.—*Geology of China*.—A most interesting report, in the name of a commission, was read by M. Boussingault, on a memoir of M. Biot, jun., concerning the probable causes of the ancient deluges mentioned by Chinese authors; to which was appended a catalogue extracted from their writings of the earthquakes, uprisings, and land-slips, or subsidences of mountains, observed in the Celestial Empire. The utility of Chinese literature in elucidating the physical history of that part of the globe was pointed out, and the authority of M. von Humboldt quoted in his observations on the volcanoes of Central Asia. In the first part of this memoir the author examined the facts and traditions collected by Chinese authors relative to two great inundations which devastated that country, and the more recent of which took place in the twenty-second century before the Christian era. These M. Biot explained by the phenomena of elevation, the traces of which M. von Humboldt had pointed out in Central Asia. He remarked that the general direction of the chains of mountains in China coincided in parallelism with that of the great chain of the Cordilleras of America, whence he inferred a simultaneity of subterraneous action in these two extensive districts. This was further

supported by the similarity of the phenomena in China to those which occur so frequently in the new world. In Eastern Asia, as in America, the earth, after a long period of repose, seldom had only one shock of earthquake at a time, but almost always a succession of shocks at short intervals. The catalogue of earthquakes, M. Biot stated, was to be found in the 301st book of the great compilation of Ma-touan-lin, formed in the thirteenth century; this catalogue had been continued to the seventeenth century by other Chinese savans, and, by aid of the kind assistance of M. Stanislas Julien, he had not only been able to bring down the list to the present day, but also to add to it many accounts that had escaped the attention of the Chinese chroniclers. Some of the quotations read from M. Biot's memoir, the dates being arranged according to the Christian era, are as follow:—"Seventy-eight years before J. C. a new peak rose on Mount Tay-Chany; this peak was upwards of fifty feet high." "Seven hundred and eighty years before J. C., in the district of Ouey, a great extent of land became lengthened, and rose suddenly several feet." "In 1599 a mountain sunk, and a lake was formed in its place; in the midst of the flat country five heights arose." M. Biot's memoir pointed out the similarity between this last phenomenon and those of Jorullo in Mexico, described by Humboldt. "In 771, in the two districts of Heng and Ting, a shaking of the earth was felt for three days; in many spots the earth opened and black water came out." "In 1568, at Yo-Ting-Hien, the earth opened at many points, and torrents of water and black sand came out." "In 125, the Mount You-Toue fell down, and killed more than 400 persons." "In 634, in the northern Chenay, a mountain fell down and was reduced to fragments." "In 887, in the district of Ouey, a mountain fell, and the sun was darkened by the dust." Examples of similar phenomena in America were largely quoted in the memoir. The Academy ordered that this document should be printed in the "Recueil des Savans Etrangers."—Two masses of native gold, one weighing five pounds and the other three pounds, were sent to the Academy by Count Demidoff, from his mines in the Oural mountains, being probably the two largest masses of this metal ever discovered.—A memoir was read from M. Maupou, on the advantage of lead being used for safety-valves, instead of iron or copper; these latter metals did not present the same strength of resistance at all parts of their surface when formed into plates for safety-valves, whereas lead was always found to bear equally. The only objection to M. Maupou's plan was, M. Arago observed, that it would be necessary to renew the valves, if made of lead, almost every day.—A memoir was sent in and read from Mr. Milne Edwards on the reproductive organs of *Cephalopodes*, *Carinaria*, &c. This gentleman, who, with M. Peters, a naturalist of Berlin, is pursuing his researches on the Piedmontese shore of the Mediterranean, has ascertained that there are two distinct sexes in the *Carinaria*, although they have hitherto been considered hermaphroditical. In the common sea-urchins, and also in the *Dendrophylla*, Mr. Edwards has recognised two distinct sexes.—The Academy has awarded Lalande's gold medal to M. Galle, the astronomer of Berlin.

*Academy of Inscriptions and Belles Lettres.* Sitting of May 22.—The commencement of a memoir by M. de Berton was read, entitled "Essays on the Topography of Tyre." In this document the author traces out all the

principal changes of the topography of the place, as far as they can be made out, from the present day backwards, to the most remote periods of its history. The first part of the memoir contained a detailed description of the actual state of the principal localities; of which the following appeared the most remarkable points:—1. A vast necropolis called Adeloun, situated three leagues north of the Tyrian peninsula, and in which tombs are found similar in form to those at Petra. 2. A small monolithic temple, near this necropolis, and dedicated to Venus or Astarte. 3. A basin, or dock, on the south of the Tyrian peninsula, formed by exceedingly solid walls, and corresponding exactly to the haling slip mentioned by Diodorus Siculus. 4. An extensive reef of rocks to the west of the peninsula, and probably once forming part of it. 5. An immense mole, now under water, which seems to have closed in the port described by Strabo as the Egyptian port. 6. The extensive cisterns called Solomon's cisterns, and the aqueducts connected with them.

The *Académie Française* has awarded the Monthyon prize of 6000f. to M. Gustave de Beaumont, for his work on Ireland.

*Academy of Moral and Political Sciences.* Sitting of 23d May.—M. Mignet read a report on the memoirs sent in to compete for a prize on the Right of Inheritance among Females in the Middle Ages. He did not think that any deserved to receive it.—The Academy has ordered Dr. Lingard's memoir on the determination of the year when Anna Boleyn returned from France to England, to be printed in the "Recueil des Savans Etrangers." It has also given a prize of 3000f. to M. Flix for the best essay on the influence of the German Customs' Union.

*Academy of Fine Arts.* Sitting extraordinary of 23d May.—At this meeting the grand prizes for musical composition were awarded, after the performance of the pieces for which they were adjudged. The first grand prize was given to M. Bazin of Marseilles, a pupil of Berton and Halevy. The second to M. Baptiste of Paris, a pupil of Halevy. Mesdames Dorus-Gras, Stolz, and other cantatrices of eminence, together with Messrs. Duponchard, Derivis, &c., sung on this occasion. The exercises did great credit to their young authors.

The *Société de Pharmacie* has awarded a prize of 1000f. to M. Hervy, for a memoir on the best method of extracting indigo from the *Polygonum tinctorium*; and a similar prize to M. Frémy, for his method of extracting pectine acid from fruits. It is the pectine that forms the gelatinous substance of fruits.

M. Biot has been named Dean of the Faculty of Sciences of Paris, in the room of the late M. Poisson.—Professor d'Alton, of Bonn, died there on the 11th of this month.

The annual meeting of the Geological Society of France is to take place this year at Grenoble, on the 1st of September.

M. Persoz, Professor of Chemistry in the Faculty of Sciences at Strasburg, in the course of his lectures on chemistry applied to the arts, liquefied and solidified carbonic acid gas in the presence of his pupils a few days since, by means of an apparatus invented by M. Thilorier. In this apparatus, the gas prepared by the action of sulphuric acid on the bicarbonate of soda liquefies itself by its own pressure, and solidifies itself afterwards, in part, in returning to a state of gas. This substance, when solidified, appears in white flakes like snow. At the same sitting the professor used it thus solidified, to produce the same effect on ether, and

also on mercury. The latter metal was beaten out like any other metal by the professor.

M. Ducos, of Toulouse, announces the publication of the "Loix d'Amour," by Guillaume Molinier, being the complete code of the Troubadours. This gentleman is also about to publish a volume of poetical fables, of which the following is a specimen:—

"La Fourmi usurière.—Fable.

Chacun sait que la Fourmi  
N'est pas avare à demi.  
Pour servir, à sa manière,  
Ses amis dans le besoin,  
Et ne rien perdre à ce soin,  
Elle s'est faite usurière.  
La Cigale en desespoir  
Dut subir sa dure loi.  
Un jour elle se présente;  
La préteuse était absente,  
Ayant quitté son comptoir  
Pour quelque pieux devoir.  
La Cigale se ravise,  
Court aussitôt à l'église;  
Et là quel est son bonheur  
D'entendre un prédicateur  
Qui tonnait contre l'aure!  
Surtout quand elle s'assure  
Que la dévote Fourmi  
Au sermon n'a pas dormi.  
La pauvre attend qu'elle sorte,  
Jusqu'à son bureau l'écorte.  
Et lui dit:—Ma sœur, avertis  
Comment avec-vous trouvez  
La morale de l'apôtre?  
'Il a bien fait son métier.'  
Répond l'insecte usurier:  
'Maintenant faisons le nôtre.'  
La Cigale eut beau prier,  
On l'écorcha comme une autre.  
L'on dit: Il a bien prêché;  
Puis l'on revient au péché."

M. Amédée Thierry has just published his "History of Gaul under the Domination of the Romans," in 2 vols. 8vo. It is perfectly distinct from his "General History of the Gauls," and contains a full illustration of the political, and more especially the social, condition of the country during those periods.—The twenty-fourth volume of M. de Sismondi's "History of France" is just out.—M. Mandet has terminated a "History of the Civil, Political, and Religious Wars in the Mountains of the Velay during the Sixteenth Century." This work, which is in one vol. 8vo., throws great light on the history of Protestantism in France at that epoch.—We have heard favourable mention made of M. Courson's "Essay on the History, Language, and Institutions of Brittany."—The last number of the "Revue de l'Architecture et Travaux Publics," which is highly thought of by the scientific world, contains an admirably engraved plate of the Travellers' Club-house, Pall Mall, to the correct elegance of which edifice it bears due testimony.—We have had a circular prospectus sent to us of a work, the title of which is to be "Petite Biographie Poétique des Bêtes illustres!"—A curious history of the origin, improvements in, and management of telegraphs, has just been published by M. Chappe, of Maus, formerly Administrator of Telegraphs; it is styled "The History of Telegraphy."

Sciara.

Del maggior Prence fra noi  
Il primiero è la metà;  
Come ho d' uopo del secondo  
Se vestirmi ho volontà.  
Senza il terzo tutto il mondo  
Saria sempre occorrita;  
E col quarto, oh Dio! sospiro  
Se dolente Amor mi fa.  
Coll' inter poi si ritratta  
Quel che offeso alcuno avra.

Answer to the last enigma:—Forbici.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

Oxford, May 21.—The following degrees were conferred:—

*Masters of Arts.*—Rev. H. W. Bellairs, New Inn Hall; Rev. C. R. S. Cocks, T. F. Twemlow, Christ Church; T. D. Bernard, Exeter College; Rev. P. E. Robin,

Brasenose College; B. E. Winthrop, Wadham College; H. W. Sullivan, Balliol College; Rev. E. C. Evans, Oriel College.

*Bachelors of Arts.*—H. J. Dixon, St. Mary Hall, Grand Compound; T. Scott, A. Oakley, New Inn Hall; J. W. J. Bennett, A. H. Smith, St. Edmund Hall; H. Symonds, B. M. Gane, Magdalen Hall; R. W. Lowry, J. F. Lowry, C. H. Sale, T. Wright, C. Torkington, Brasenose College; J. L. Moody, J. H. King, J. Fletcher, J. M. Gresley, St. Mary Hall; J. G. Hawkins, Scholar, W. F. Sweet, J. J. Trollope, H. E. Devey, Pembroke College; W. Rogers, G. J. Davis, Exeter College; H. T. Price, Jesus College; F. C. Twemlow, Oriel College; F. W. Garnett, Balliol College; C. Cookson, G. W. Ashworth, University College; C. Penny, Worcester College; W. D. Stent, Wadham College; I. Morgan, Trinity College.

CAMBRIDGE, May 20.—The following degrees were conferred:—

*Honorary Master of Arts.*—T. C. W. S. Rice, Trinity College.

*Master of Arts.*—R. L. Tottenham, St. John's College; J. S. Howson, C. Mayor, Trinity College; T. K. Bowyear, Caius College; H. R. Smythies, Emmanuel College.

*Bachelor in the Civil Law.*—J. D. De Skelton, Trinity Hall.

*Bachelors of Arts.*—J. E. Yonge, R. Williams, A. B. Simonds, E. Balston, R. H. Tuck, King's College; W. B. Strong, R. S. White, H. H. Stretell, G. N. Vansittart, C. Ibbotson, W. A. Cross, B. Crompton, Trinity College; O. J. Williamson, R. Tindall, R. E. Monins, G. Gunning, W. M. Kerr, St. John's College; S. A. Cooke, T. J. Burton, St. Peter's College; J. F. Wergusson, Caius College; A. E. Rogers, C. J. Shebbeare, G. Elder, Queen's College; J. Thornton, W. Haver, Catherine Hall; E. F. Manby, Christ's College; B. Dixie, Emmanuel College.

#### SOCIETY OF ANTIQUARIES.

HUDSON GURNEY, V.P. in the chair.—Mr. Gurney exhibited a cast of the seal of the Earl of Derby and the Countess of Richmond, Lord and Lady of the Liberty of the Honor of Richmond, temp. Henry VII.—The Dean of Hereford exhibited a model of the head of a bishop's crook, or pastoral staff, discovered in Hereford Cathedral in the year 1813, resting on the shoulder of a skeleton, with a ring, and the leaden seal of a papal bull. These relics were preserved in the library of the cathedral, whence they were stolen in 1838, and the model was made from a drawing. The Dean considered the remains to be those of Trelic, bishop of Hereford in the reign of Henry III.—Mr. Halliwell's paper 'On certain Events in England in the Reign of Edward IV.' was concluded.—Mr. Cottingham exhibited a drawing of an ancient painting discovered on the wall of Canterbury Cathedral, on removing the pulpit, with the costume of the thirteenth century.—Mr. Thoms communicated a paper 'On the Connexion of the Early Drama of England and Germany,' observing that the English appear to have led the Germans in their taste for the drama; English comedians performed often in Germany, and English plays were translated into the German language; and that an old English play had been the foundation of Shakspeare's "Tempest," and also of a German play.

#### ROYAL SOCIETY OF LITERATURE.

On Thursday, the President, Lord Ripon, and afterwards Lord Colborne in the chair.—The Earl of Clarendon was admitted a member.—Mr. Hamilton read a paper from Mr. Millingen at Naples, upon a small bronze figure of Venus Urania (which was upon the table), accompanied by curious pantheistic emblems, which differed from any representation of the Divinity hitherto described. The bronze is of the second or third century, and a curious mixture of beauty and deformity in art.—Mr. Cattermole continued a portion of Dr. Nolan's 'Disquisition on the Obelisks of Carnac and Luxor,' which he attributes to Amenses, the Pharaoh's daughter who rescued Moses. The meeting concluded with a short notice correcting a mistake in the copyist of Herodotus.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Entomological, 8 P.M.; British Architects, 8 P.M.; United Service Institution, 9 P.M.  
*Tuesday.*—Linnean, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.  
*Thursday.*—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.  
*Friday.*—Royal Institution, 8½ P.M.; Botanical, 8 P.M.

#### FINE ARTS.

##### ROYAL ACADEMY.

[Fourth notice.]

123. *Scene from "A Legend of Montrose,"* &c. F. Stone.—The passage in the legend is a very affecting one, and the artist has embodied it in a very striking and interesting composition; it is painted with great care, and with good effect, both as to colouring and execution.

393. *The Eve of the Deluge,* and 509, *The Assuaging of the Waters.* J. Martin.—Two of the most sublime productions of that justly celebrated and original painter's pencil. In "The Assuaging of the Waters" especially, light and motion were never more vividly conveyed to the eye through the medium of art. These again are most powerfully contrasted by the accessories of the dove, the raven, and the drowned serpent coiled round the upper branch of a tree.

415. *The Martyrdom of St. Thomas à Becket.* A. W. Elmore.—We have seen sufficient examples from the pencil of this young artist to excite our admiration and to elicit our praise; neither do we deny the talents displayed in this performance; but we are of opinion that if the title had been "the death" of Thomas à Becket, instead of "the martyrdom," it would have been more suitable to the known character of the prelate in question. All are aware of and allow the atrocity of the deed; and the disgusting details set forth in the quotation are therefore worse than unnecessary.

We have this year been detained longer than usual by the number of pictures of merit of an historical or imaginative character. We are bound, however, to add that the productions in the landscape department of art are entitled to equal attention. Among these, as may well be anticipated, the works of Mr. Stanfield hold a distinguished place; for, wherever those works are found, whether in the palace, the club-room, the theatre, or the private mansion, they cannot fail to excite universal admiration. Our favourites in the present Exhibition are

148. *Ancona, on the Adriatic.* C. Stanfield, R.A.—The completeness of this charming performance as a composition, in distance, middle space, and foreground, must recommend it to the eye of the enlightened connoisseur; as the same qualities, no doubt, recommended the original scene to the notice of the accomplished painter.

13. *Citara, in the Gulf of Salerno, looking towards the Coast of Calabria.* C. Stanfield, R.A.—A picture on a large scale, embracing many—perhaps too many—varied and interesting objects. Redundance, however, is always better than meagreness.

470. *On the Coast, near St. Malo.* C. Stanfield, R.A.—As near perfection as can well be imagined. Simple in character, and exhibiting all the truth and transparency of waves in motion which distinguished the works of the best marine painters of the Flemish School.

185. *Charcoal Burning.* F. R. Lee, R.A.—This faithful painter of the rural scenery of England deservedly occupies some very promi-

nent situations in the present Exhibition. His works always call up interesting associations. Besides that, the title of which we have just mentioned, we were greatly delighted with 360. *Northwick Park,* and 424. *Taking up Trimmer-lines.*

215. *A Saw-pit,* and 273. *The By-road.* T. Creswick.—To the productions of no artist that we know of does the term "picturesque" apply more fully than to those of Mr. Creswick. The first of these examples shews with what simple materials he can work out his purpose; and the last proves his taste in the selection of a spot which well deserves to be visited, although it should lie a dozen miles out of the traveller's direct road.

439. *The Entrance to Hastings, Sussex, taken in 1822.* T. C. Hofland.—First impressions are as important to towns as they are to men, and to no towns are they more important than to those known by the name of "watering-places." The permanent inhabitants of Hastings ought to feel much obliged to Mr. Hofland for the very attractive character which he has imparted to this entrance to their abode.

217. *The Castle of Chillon, on the Lake of Geneva.* J. J. Chalon, A.—We have seen the pencil of this able artist successfully employed on many a lively, many a romantic scene, but this production is the *il penseroso* of art. To the

"Double dungeon wall and wave  
Have made,"

the bird of sad omen, hovering over disturbed waters of a leaden hue, and the surrounding mountains of a similar dismal cast, are appropriate and well-executed accompaniments.

We have selected these specimens of landscape painting on account, not only of their merits, but of the variety of style which they exhibit. Other works in the same class of art, by Havel, Arnald, Linton, J. Wilson, Charlotte Nasmyth, &c., will also be found well worthy the attention of the visitor.

In composition, character, and colouring, as well as in those accessories which indicate the rank or profession of the individual represented, the English school of portraiture possesses equal claim to distinction. Even the days of Vandyke hardly presented the rich variety in the last respect introduced by Sir Joshua Reynolds, and so successfully adopted by his successors. The portraits, this year, are rather more thinly scattered than usual; but some of them are of surpassing merit. As to their particular qualities, our limits compel us to leave them to speak for themselves (which they are well able to do), and to content ourselves with simply enumerating a few of the most prominent, viz.

62. *The Queen Victoria, in the Robes of State in which she meets the Parliament.* Sir David Wilkie, R.A.—173. *H.R.H. the Prince Albert of Saxe Coburg and Gotha, in the Robes of the Order of the Garter.* G. Patten, A.—67. *H.R.H. The Duke of Sussex, in the Chair of the Royal Society.* T. Phillips, R.A.—54. *Lord Sudeley,* and 68. *Robert Berkeley, Esq.* Sir M. A. Shee, P.R.A.—14. *His Grace the Duke of Norfolk, K.G., Hereditary Earl Marshal of England.* H. W. Pickersgill, R.A.—102. *The Ladies Charlotte, Augusta, and Katherine Scott, Great-grandchildren of the late Lord Chancellor Eldon, with his favourite dog Pincher, a German Spaniel.* (The dog by E. Landseer, R.A.) H. P. Briggs, R.A.—156. *Mrs. Constable.* Mrs. W. Carpenter.—463. *Apsley House. The Duke of Wellington explaining to the Compiler of his Despatches the date of that which describes the Battle of Water-*

loo. A. Morton.—462. *Charles Dickens, Esq.* D. Macdise, R.A. Elect. — 459. *Mrs. Shelley, Authoress of "Frankenstein,"* &c. R. Rothwell.—458. *Mrs. Grottoez.* A. Geddes, A.—475. *The Lord Alfred Paget,* and 508. *Mrs. Bateman.* F. Grant: with others by B. R. Faulkner, F. R. Say, J. Hollins, &c.

[To be continued.]

#### THE DELUGE, BY F. DANBY, A.R.A.

WE have had a hurried look at this glorious and sublime composition—a picture in itself making an epoch in art. Mr. Danby has indeed signalled his return to his native land by producing that which would reflect lasting honour on any school and any country. It is impossible to describe this superb work of imagination, or its effect upon the beholder. Not only is the general impression appalling, but every part of the awful scene speaks to the heart. The desolating elements, comet, water-spout, whirlwind; the pallid light; the upturned rocks; the dread groupings of thousands of human beings, in every form of struggle and agony; all that is natural and supernatural thrown together with wonderful force, yet finished and beautiful in the details. Such are a few of the most striking merits of this painting, to which even at this late hour we hasten to pay the tribute of a necessarily brief, but most hearty eulogium.

#### NEW PUBLICATIONS.

*The Illuminated Atlas of Scripture Geography: a Series of Maps, delineating the Physical and Historical Features in the Geography of Palestine and the Adjacent Countries; accompanied with an Explanatory Notice of each Map, and a copious Index of the Names of Places.* By W. Hughes, F.R.G.S. London, 1840. Knight.

THIS title-page fully describes the nature of a publication, of which we need say no more than that it is extremely well done, and possesses, by its merits, strong claims on the favour of all readers of Scripture.

*Giulia Grisi.* Negelin del.; F. C. Lewis sculp. Mitchell.

A GOOD resemblance, and a portrait of much elegance and taste. It has been engraved by Mr. Lewis with his usual skill.

*A Scrub.* Painted by W. Hunt; Engraved by J. Egan. Moon.

IF every body who laughed at Mr. Hunt's whimsical drawing when it embellished the walls of the Gallery of the Society of Painters in Water-colours, were to purchase an impression of this clever plate, it would prove to the publisher one of the most profitable speculations of the day. Mr. Egan has not only preserved the expression of the original, but has imitated the free, forcible, though somewhat scratchy style of Mr. Hunt's execution, with marvellous exactness.

*Panic-Struck.* Painted by W. Hunt; Engraved by H. J. Ryall. Ackermann and Co. ONE of Mr. Hunt's whimsical ideas, well suited to be a companion to the above. The elongation of the features in the shadow on the wall, occasioned by the position of the candle (the flame of which seems itself to be in a state of great alarm), is a finely aggravating circumstance of the scene.

*Portraits by Count D'Orsay.* Mitchell. WE have seen several recent productions from this noble artist's pencil, viz. Lords Normanby and Fitzharris, Mr. Guthrie, &c. In addition

to the quality of likeness, they have that certain air of refinement and *haute ton* with which the Count cannot help imbuing his heads.

*Original Studies of Animals.* Drawn from Nature by Thomas Landseer. Part I. Dobbs and Co.

THE name of Landseer renders it unnecessary to add that this little publication is full of spirit and character.

*Ricauti's Rustic Architecture.* Part I. Templeman.

YOUNG ladies and young gentlemen are fond of talking of "Love in a Cottage." In such cottages as those represented in this pretty little publication, we can easily understand that Dan Cupid would gladly take up his abode. They shew the pleasing effect of rough wood, thatch, &c., when applied by the hand of taste, as the only decorations of rural buildings.

#### ORIGINAL POETRY.

##### THE LAND OF THE NORTH.

By Charles Mackay.

THE lands of the East may exult in the sun,  
That rises amid them, chief pride of their story;  
The lands of the West,  
Where he sinks to his rest,  
May boast that they share in the beams of his glory;  
And the South may be proud of its evergreen bow'rs,  
And its breezes that sport all the year among flow'rs,  
But bright though these lands, are they better than ours?  
No!—and the bold shout o'er the universe forth,  
That Valour and Enterprise dwell in the North!  
We care not that sunshine is rare in our skies,  
That fog is our guest, and the pole is our neighbour,  
The generous soil,  
Yields us wealth when we toil,  
And Virtue and Health are offspring of Labour.  
The sky may be bright over Liberty's grave,  
Spontaneous the soil in the land of the slave,  
And the heart may be cold where the orange-trees wave;  
So we send the bold shout o'er the universe forth,  
That Freedom was born 'mid the cold of the North.

#### THE DRAMA.

*Haymarket Theatre.*—On Saturday, a tragedy, by Mr. Serjeant Talfourd, entitled *Glencoe*, and founded on the massacre which connects that name with everlasting infamy, was produced here with success. We are unable to enter into critical details till next week, when we hope to do justice to the poet and the performances.

*Miss Kelly's Theatre.*—All who remember Miss Kelly's impersonations in domestic and pathetic drama (and who that has been any time a playgoer does not?), will be rejoiced to hear of her return to the stage, and the establishment of her theatre and dramatic school. From an oversight, we did not get our card till too late to pay proper attention to the performances this week, and can only say, that the theatre is a very convenient and pleasant saloon, and that the proprietress is as effective as ever in the *Serjeant's Wife*, which has been the principal part of each evening's entertainment.

#### VARIETIES.

*Caricatures.*—Three new H. B.'s raise his number to 640. The first are "Wood-be Conservatives," viz. Lord Howick and Mr. Wood agreeing to vote against their old friends, the "Whig-radicals," who have "accepted their resignations" so unreluctantly. We cannot speak to the noble scion of the Grey house, but Mr. Wood's likeness is not like. The next is a caricature of the Post-Office envelope, in which Wellington, O'Connell, Lord Monteagle, the Chancellor of the Exchequer, &c., whimsically take the parts of Mulready's figures, whilst Lord Palmerston personates Britannia flying off despatches to all quarters of the globe. The

last is "St. George and the Dragon;" Lord Stanley being the saint, and O'Connell the dragon, in whom is not forgotten the tail, which

"Like a wounded snake drags its slow length along."

It is a spirited performance.

A penny caricature of the new Post-Office envelope, from a design by Moll-Roony, R.A.M., is full of humour. The travesty of the figures is most laughable. We advise every body to get a copy or two: it is a capital scrap-book and album article, and as cheap as dirt.

*German Literature.*—Mr. August Hirsch, from the University of Berlin, delivered at Willis's Rooms, St. James's, on Thursday the 21st inst., the first of his second series of annual lectures upon German epic poetry. The audience were numerous and appeared very attentive. This lecture consisted of some of the best selections from the well-known "Kinder und Hausmährchen" of Grimm, the beauties and genius of the language of which were elegantly elucidated by Mr. H. who appears to be a perfect master of his subject. Mr. H. distributed a verbal and interlineal translation of his selections, which, no doubt, proved of great advantage to that part of his auditors who might not have been very far advanced in the study of the language; and by this means they had an opportunity of perusing the selections at their leisure after the lecture. We are happy to find that Mr. H.'s second lecture (next Thursday) will comprise selections from the "Nibelungenlied."

*Statistics.*—The following striking view of the important question which so much agitates the country has been handed to us:—

"Comparative Statement of the Wages paid to Mechanics, Manufacturing Operatives, and Agricultural Labourers, in the various Countries from whence Bread Corn could be exported in times of plenty; and the Wages paid to similar Work-people in Great Britain, 1839.

Average of the Wages per day paid	In Oceania.	In Poland & Russia.	In Spain.	In Denmark & Germany.	In France.	In Great Britain.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
To a Mechanic.....	1 2	1 8	1 3	1 4	2 7	3 8
To a Manufacturing Operative...	1 3	1 0	0 10	1 4	1 8	
To an Agricultural Labourer.....	0 4	0 5	0 7	0 9	1 2	1 10

From whence it will be seen that the agricultural labourer in Great Britain is paid nearly *three times* as much wages as the average (7½d. per day) of the above countries; the manufacturing operative, about *one third* more than the average (1s. 1½d. per day); and the mechanic and artisan, about *one half* more than the average (1s. 9½d. per day).

Brompton, May 1840. LEWIS KENNEDY.

*Horrors of Indecision.*—A judge down west was lately so equally and strongly divided in opinion upon the question, whether robbery was cheating or borrowing, that he fell in two.

On removing the pulpit of Rochester Cathedral, last week, a curious fresco painting was discovered on the stone wall behind. It is in tolerable preservation, and represents several figures. The bishop's throne has also been taken away, by which the fine proportions of the choir, as well as the carved corbels which were concealed by it, are beautifully developed.—*Oxford Herald.*

*Sir Sidney Smith.*—This gallant officer has died at Paris, aged 76.

*Institution of Civil Engineers.*—The conversazione at Mr. Walker's (the President), on Wednesday evening, was very numerous and brilliantly attended. We could hardly tell whether the rooms were most adorned by rank or

science; but we are sure it was very gratifying to see them so mingled together. As usual, the refreshment tables were profusely and elegantly spread; and the company, after enjoying the inspection of many curious inventions, models, &c., did not take the parting chat and glass till the chimes of midnight sounded from the neighbouring abbey of Westminster.

"*Lean's Engine Reporter*," published at Marazion, in Cornwall, has the following announcement:—"The number of pumping-engines reported this month is fifty-two. They have consumed 4218 tons of coal, and lifted 42,000,000 of tons of water ten fathoms high. The average duty of the whole is, therefore, 55,000,000 of pounds lifted one foot high by the consumption of a bushel of coal!!"

*Charter House Square Infirmary*.—The anniversary of this truly humane and benevolent institution, this week, was well attended, and a liberal subscription announced. Mr. Salmon, the surgeon, whose exertions in this cause can never be too highly panegyrised, addressed the company with great feeling, and stated the progress and prospects of the Infirmary. Without going into details, we will simply say that there is not a charity in London which more needs, or better deserves, the public patronage. No pathetic or wrought description can paint the pain and misery it is its object to mitigate or cure; and no individual who has a sense of sympathy for the sufferings of his fellow-creatures can but imagine these without putting out his hand to alleviate them.

*Royal College of Surgeons*.—We are glad to see a fresh spirit of activity in this respectable body. Three annual *studentships*, each to be held for three years, with 100 guineas per annum, have been instituted; and three assistant-surgeons in the army, navy, and East India Company's service, are held out as prizes to the most deserving. The anatomical triennial prize has also been raised from thirty to fifty guineas.

*Improvements in Carriages*.—It is always with satisfaction we notice the progress of improvements in the useful arts; and, among these, we may mention an emendation on carriages, for which Messrs. Prior and Co. have taken out a patent. On examining these handsome vehicles, we are immediately convinced of the advantage which has been gained by altering the mode of mounting and fixing the forewheels; in consequence of which there is more safety in turning, and less space required. The wheels are also allowed to be larger, and much ease thus given to the motion. Without describing all the points, however, of axles, perchbolts, &c. &c., we shall merely state that, for convenience and beauty, these new modifications appear to us to be of great value.

*The Société Libre des Beaux Arts*, Paris, at their annual general meeting, held on the 10th of May, awarded a silver medal to Mr. Godwin, jun., as author of a work on the "Churches of London." We always approve highly of these international compliments.

#### LITERARY NOVELTIES.

In the Press.

The Papers and Correspondence of the late President of the Horticultural Society, T. A. Knight, Esq., and also Letters of some of the first Botanists and Naturalists in Europe. The Editors are George Benthall, Esq. Secretary to the Horticultural Society, and Dr. Lindley.

Wednesday 27	36 . . . 67	29.91 . . . 29.43

Wind, north on the 21st and 22d; south-west on the 23d and two following days; on the 26th, west in the morning, and north-west in the afternoon; the 27th, south-west.

Except the afternoons of the 21st, 23d, and two following days, generally clear: rain fell on the 24th and two following days.

Rain fallen, .19 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

"A Friend to Truth and Justice" is informed that we never interfere with contemporary criticisms. It is enough for us to attend to these qualities in our own Journal.

The letter of "A Subscriber" from Trimley, respecting the Jews, &c., is returned to his address: there being much more information on the subject by recent arrivals.

Several interesting publications have reached us too late for notice this week.

#### ADVERTISEMENTS.

Connected with Literature and the Arts.

**THE SIXTH ANNUAL EXHIBITION** of the NEW SOCIETY OF PAINTERS in WATER-COLOURS is now open, at their Gallery, 53 Pall Mall West (adjoining the British Institution), from Nine o'clock till Dusk.  
Admission, 1s. Catalogue, 6d.  
JAMES FAHEY, Hon. Secretary.

**UNIVERSITY OF LONDON.—FACULTY OF MEDICINE**  
**THE First Examination for the Degree of**  
Bachelor of Medicine is appointed to commence on Monday, the 6th of July next. The Certificates required must be transmitted to the Registrar fourteen days before the Examination begins.  
By order of the Senate,  
R. W. ROTHMAN, Registrar.

Seminar House, 20th May, 1840.

**RESTRAINTS ON MARRIAGE.**—At a Meeting of parties aggrieved by the existing restrictions upon Marriage, held at the Office of Messrs. Crowder and Maynard, No. 2 Mansion House Place, London, on Thursday, the 24th inst., a Committee, consisting of seven of the gentlemen present, was appointed (with power to add to their number), to take the necessary steps for obtaining a repeal of the objectionable restrictions upon Marriage, and more particularly that which prohibited marriage with a deceased Wife's Sister, and it was resolved, that the objects of the meeting should be forthwith published in such of the London and Provincial papers as the Committee might think proper, with a view to obtain the active co-operation of all parties interested.—Communications to be addressed to Messrs. Crowder and Maynard, as above.

#### BLACK'S ATLAS COMPLETED.

Price 9l. 10s. beautifully coloured, and handsomely half-bound in Morocco, gilt leaves.

**A GENERAL ATLAS of the WORLD,**  
In Fifty-four Folio Sheets.  
Engraved on Steel by SIDNEY HALL, in the first

With Geographical Descriptions, Statistical Tables, and a Copious Topographical Index.

"We may now say with certainty, that as no Atlas exceeds Black's in the neatness of its form and the utility of its dimensions, so, in geographical accuracy and the beauty of execution, it is equal to any work of the kind, and its utility is increased by the charge. We have not been disappointed in a single reference to any of the Maps yet issued, and we have severely tested those of the present number."—*Atlas*, 10th August, 1839.  
Adam and Charles Black, Edinburgh; Longman and Co.; Simpkin, Marshall, and Co.; Whittaker and Co.; and Hamilton, Adams, and Co. London.

#### INDIA, PERSIA, and CAUBUL.

WYLD'S MAP of all the COUNTRIES lying between TURKEY and BURMAH; comprising Asia Minor, Persia, and Arabia; and including the Black, Caspian, and Red Seas, particularly constructed to show the overland route to India, and the relative position of Russia to the Anglo-Indian possessions, with Enlarged Plans of the Dardanelles and Bosphorus. Four Sheets, 11.; Case, 11. 10s.

Map of India, constructed with great care and research from the latest authorities, and intended more particularly to facilitate a reference to the Civil and Military Stations, with a Polymetrical Table of Reciprocal Distances. One large sheet, 15s.; Case, 11. 10s.

An Index to Wyld's Map of India, containing the Names of many Thousand Places, with their Latitude and Longitude, 8vo. 10s.  
Published by James Wyld, Geographer to the Queen, Charing Cross East, four doors from Trafalgar Square, London.

#### BOOKS IN THE PRESS.

NEW WORK, EDITED BY G. P. R. JAMES, Esq.  
Just issued, in 3 vols. 8vo., with portraits, 25s. bound.  
**LETTERS ILLUSTRATIVE OF THE REIGN of KING WILLIAM III.**  
addressed to the Duke of Shrewsbury.  
By JAMES VERNON, Esq. Secretary of State.  
Edited, with Introductions and Notes, by G. P. R. JAMES, Esq.  
Author of "Memoirs of the Court of Louis XIV."  
Richelieu, &c.  
Henry Colburn, Publisher, 15 Great Marlborough Street.  
\* Orders received by all Booksellers.

#### ALISON'S EUROPE.

On the 10th of June will be published, Volume Eighth, of  
**THE HISTORY of EUROPE; from the**  
Commencement of the French Revolution to the Restoration of the Bourbons.  
By ARCHIBALD ALISON, F.R.S.E. Advocate.

Contents:—Domestic Transactions of Great Britain from 1810 to 1812, and Characters of George the Third, George the Fourth, Lord Liverpool, Lord Brougham, Mr. Huskisson, and Sir Samuel Romilly; Sketch of the English, German, and French Literature during the Age of the French Revolution—Debates on the Regency Question; the Orders in Council; the Bullion Report; and the Continuance of the Spanish War, in the British Parliament—Formation of the Spanish Constitution of 1808, and Victories of Such in the East of Spain—Battle of Albuera, and Wellington's Operations on the Portuguese Frontier in 1811—Wellington's Campaign of Badajoz and Salamanca—War between the Russians and Turks from 1808 to 1812—Accession of Bernadotte to the Swedish Throne, and Causes which led to the Russian War of 1812—Advance of Napoleon into Russia: Battle of Borodino, and Burning of Moscow—The Moscow Retreat.  
Volume Ninth will be published in November. This volume completes the Work, bringing down the History to the Battle of Waterloo; and also containing a Copious Index to the whole.

A Third Edition of the First and Second Volumes, price 11. 10s.

A Third Edition of the Third and Fourth Volumes, price 11. 10s.

The Fifth, Sixth, and Seventh Volumes may be had separately, price 15s. each.  
William Blackwood and Sons, Edinburgh; Thomas Cadell, London; and J. Cumming, Dublin.

**COMPLETE WORKS of SIR E. L. BULWER.**

The New Volume of Sir E. L. Bulwer's, to be published on the 1st of June, will contain  
**The Pilgrims of the Rhine, and the Student,**

Beautifully illustrated from Drawings by Catermole. Negotiations having been concluded with Mr. Colburn and Mr. Bentley for the permission to include the Works of which the copyrights had been purchased by them in this Series, the edition will now contain the entire Works of Sir E. L. Bulwer, in a complete and uniform shape.

Saunders and Otley, Conduit Street; Simpkin, Marshall, and Co. Stationers' Hall Court; Bell and Bradfute, Edinburgh; and John Cumming, Dublin.

Kew and its Gardens: Botany considered with reference to the Colonies.—9. Ferromas: Tak-Wan-Poo.—10. Past and Present State of the American Navy—Colonial Intelligence, Births, Marriages, and Deaths, &c.

Fisher, Son, and Co. Newgate Street, London.

**SHIP-BUILDING.**

In 4to. price 12s. with Fifteen Engravings on Steel, and numerous Woodcuts.

**TREATISE on the THEORY and PRACTICE of NAVAL ARCHITECTURE;** being the Article "Ship-Building" in the "Encyclopædia Britannica," 7th edition.

By AUGUSTIN F. B. CREUZE,

Member of the late School of Naval Architecture, President of the Portsmouth Philosophical Society, and Editor of the Papers on Naval Architecture.

Adam and Charles Black, Edinburgh; Simpkin, Marshall, and Co.; Whitaker and Co.; and Hamilton, Adams, and Co., London; and John Cumming, Dublin.

**NEW WORKS JUST READY.**

**I. The Stage.**

Both Before and Behind the Curtain.

By Alfred Bunn.

Late Lessee of the Theatres Royal Drury Lane, Covent Garden, &c.

"I am (not) forbid

To tell the secrets of the prison-house."

3 vols. post 8vo.

**II. The Life, Journals, and Letters, of Samuel**

**Pepys, Esq. F.R.S.**

Including a Narrative of his Voyage to Tangier. The whole now first published from the Originals.

3 vols. 8vo.

New Works just published:—

**I. Stephen Dugard; a Novel.**

By the Author of "The Five Knights of St. Alban's,"

"Nabilla," &c. 3 vols.

**II. Three Years' Residence in Canada**

(1827—1830).

By T. R. Freston,

Late of the Government Service at Toronto.

3 vols. post 8vo.

**III. The First Three Volumes of the complete edition of**

**Horace Walpole's Letters**

(To be comprised in 6 vols.),

Are now published, price 14s. each, embellished with numerous fine Portraits.

"Horace Walpole's Letters" are unequalled in the language; delightful in themselves, and a most amusing and instructive commentary on the history of the country, from 1725 to 1797.

This edition is to contain not only all that have been published, but several hundred letters which have hitherto existed only in manuscript; the whole arranged in chronological order. We look forward with pleasure to the publication of the remaining volumes, and have no doubt we shall glean from them a rich harvest."—*Atlas*.

Richard Bentley, New Burlington Street,

Publisher in Ordinary to Her Majesty.

**LADIES' KNITTING and NETTING-**

BOOK: being the Fifth of the First Series, and the Second of the Second Series.

Also, nearly ready, in 1 vol. post 8vo.

**Annals of Humble Life.**

John Miland, Librarian, 25 Chapel Street, Belgrave Square.

**Library Terms:—**

One Year, 6s. 6s.; Six Months, 3s. 3s.; Three Months, 1s. 1s.

BURKE'S WORKS, WITH GENERAL INDEX: THE ONLY COMPLETE EDITION.  
In 16 vols. 8vo. price 6l. 17s. in boards.  
**THE WORKS OF THE RIGHT HON. EDMUND BURKE.**  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.  
\* \* \* A few Copies may be had on royal paper, price 9l. 12s. in boards; also, several of the latter Volumes, in demy and royal 8vo. and 4to. to complete Sets.

In 18mo. price 2s. 6d. half-bound, the 4th edition, with Frontispiece, of  
**A PLAIN AND SHORT HISTORY OF ENGLAND FOR CHILDREN,** in Letters from a Father to his Son. With a Set of Questions at the End of each Letter, from "The Cottager's Monthly Visitor."  
By GEORGE DAVYS, D.D.  
Lord Bishop of Peterborough.

### A Volume for a Lending Library.

18mo. 4s. 6d. in cloth, lettered.  
\* \* \* The Selections contained in this Volume have, most of them, appeared in "The Cottager's Monthly Visitor."  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 18mo. price 5s. 6d. bound and lettered, the 4th edition of  
**THE PARENT'S POETICAL ANTHOLOGY;** being a Selection of English Poems, primarily designed to assist in forming the Taste and the Sentiments of Young Readers. They are classed under the following heads:—

- |                              |                                                             |
|------------------------------|-------------------------------------------------------------|
| 1. Hymns                     | 8. Inscriptions                                             |
| 2. Scriptural Pieces         | 9. Descriptive and Narrative Pieces, &c.                    |
| 3. Religious and Moral Poems | 10. Sonnets                                                 |
| 4. Odes and Lyrical Pieces   | 11. Longer Poems, including Bishop Heber's "Palestine," &c. |
| 5. Elegiac Poems             |                                                             |
| 6. Epitaphs                  |                                                             |
| 7. Pathetic Pieces           |                                                             |

Longman and Co.; J. G. F., and J., Rivington; Whittaker and Co.; Simpkin and Co.; and J. Souter.

In 18mo. price 6s. in boards, a new edition of  
**MEMORIALS OF A DEPARTED FRIEND.**  
"She being dead, yet speaketh."—*Rev. xl. 4.*  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

INFANT SCHOOLS.  
In 12mo. price 4s. 6d. boards, the 2d edition of  
**A COURSE OF LESSONS,** together with the Tunes in which they are usually sung in Infant Schools; and also a copious Collection of Hymns and Moral Narratives, suitable for Infant Instruction, either in Schools or in Private Families.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

New edition, enlarged,  
**EUCLID'S ELEMENTS;** the First Six and the Eleventh and Twelfth Books, chiefly from the Texts of Simon and Playfair. With Corrections, and an improved Fifth Book. Also, Supplementary Treatises on Plane Trigonometry, Incommensurable Quantities, the Composition of Ratios, and the Quadrature of the Circle. Together with Notes and Comments.  
By J. R. YOUNG,  
Professor of Mathematics in Belfast College.  
2d edition, considerably enlarged, 8s.  
London: John Souter, 121 Fleet Street.

- Of whom may be had, by the same Author,
1. Elements of Geometry, 8vo. 8s.
  2. Elements of Algebra, 12mo. 6s.
  3. A Key to ditto, by W. H. Spiller, 6s.
  4. General Theory of Algebraical Equations, 8s.

### REVIEWS OF NEW BOOKS.

*Narrative of an Expedition to the Polar Sea, in the Years 1820, 21, 22, and 23.* By Lieutenant (now Admiral) Ferdinand von Wrangell, of the Russian Imperial Navy. Edited by Major Edward Sabine, R.A. F.R.S. 8vo. pp. 413. London, 1840. Madden and Co.

THERE are three principal points in which the interest and importance combined in this volume are eminently deserving of consideration; and which render it altogether one of the most valuable contributions to the great inquiry respecting the Arctic regions which has at any time issued from the press.

In the first place, it opens a new hope that this sea may be safely and successfully navigated.

In the second place, it affords us a connected chain of history, which unfolds the circumstances of preceding explorations.

And, in the third place, it gives us a narrative of personal adventure, and an account of native life and manners which is at once very affecting and extremely curious.

Thus are the future, the past, and the present, elucidated in the work; and, independently of its geographical discoveries and emendations (illustrated by an excellent map), and other scientific matters, there are many other recommendations with which we have been, and we are sure the public will be, highly gratified. Among these we may mention the admirable style in which the translation has been made by Mrs. Sabine, — more like pure original English composition than under the constraints of a foreign idiom; — and the very able editing of Major Sabine, whose talent and experience fitted him more perfectly for the task than any other individual existing.

With these advantages, M. von Wrangell's *Narrative* must meet with a cordial reception; and when the pleasure is so great we can hardly regret that it has been so long deferred.

Before we proceed to the details, it is our duty to revert to the first point to which we have alluded, and direct attention to what we think ought to be the result of that statement.

"The facts (observes Major Sabine in his preface) and circumstances made known by an expedition which was engaged during three years in geographical researches, extending over fifty degrees of longitude of the coasts of the Polar Sea, must in many instances bear, by a close analogy, on reasonings connected with the yet unexplored portion of the Arctic circle; and they do so particularly in respect to that part which has been, and still continues to be, the theatre of British enterprise. There is a striking resemblance in the configuration of the northern coasts of the continents of Asia and America, for several hundred miles on either side of Behring Straits; the general direction of the coast is the same in both continents, the latitude is nearly the same, and each has its attendant group of islands to the north, — the Asiatic continent, those usually known as the New Siberian Islands; — and the American, those called by Sir Edward Parry the North Georgian Group, and since fitly named, from their discoverer, the Parry Islands. The resemblance includes the islands also, both

in general character and in latitude. With so decided a similarity in the configuration and position of the land and sea, it is reasonable to expect that there should be a corresponding resemblance in the state and circumstances of the ice, by which the navigation of the ocean may be effected. In perusing M. von Wrangell's description of that portion of the sea which is comprised between the Asiatic continent and the New Siberian Islands, those who have had personal experience of the corresponding portion of the sea on the American side, namely, of the portion included between the continent and the Parry Islands, must at once recognise the close resemblance which the ice described by M. von Wrangell bears to that which fell under their own observation. In both cases, in summer, a narrow strip of open water exists between the shore and the ice, admitting of the occasional passage of a vessel from point to point, subject to frequent interruptions from the closing of the ice on the land by certain winds, and from difficulties at projecting capes and headlands. The main body of the ice, by which the sea is covered, is at that season broken into fields and floes of various extent and size, with lanes of open water intermediate; and in this state things remain till the first frosts of autumn, when the whole is cemented into a firm and connected covering, and remains so during the winter. From the circumstance of the Siberian Islands being rich in the remains of mammoths, which form a valuable article of commerce, this natural bridge is traversed every year by many persons, who pass and repass in winter and in spring: — on the American side it is trodden only by the rein-deer and musk-oxen, in their spring and autumn migrations. The thickness of ice formed in a single season is stated by M. von Wrangell to be about nine and a half feet; if prevented from drifting away during the summer, a second season will add about five feet; and a third season, doubtless, somewhat more. The fields of ice, which have been met with by the British expeditions in parts of the sea which are known to be cleared in every year, — in Baffin's Bay and Hudson's Straits, for example, and to the north and west of Spitzbergen, — have usually been from nine to ten feet thick; but I well remember the surprise excited in the expedition which penetrated to Melville Island, at the extraordinary and unprecedented thickness of the field-ice which they encountered, after passing Barrow Strait, and entering, for the first time, the portion of the sea comprised between the continent and the islands to its north; evidencing that on that portion of the sea the icy covering remains for successive years. The general thickness was more than double that of the formation of a single year. All the attempts to effect the north-west passage, since Barrow Strait was first passed in 1819, have consisted in an endeavour to force a vessel, by one route or by another, through this land-locked and ice-encumbered portion of the Polar Ocean. No examination has made known what may be the state of the sea to the north of the Parry Islands; whether similar impediments may

•• The party, of which I was myself one, who walked

there present themselves to navigation; or whether a sea may not there exist, offering no difficulties whatsoever of the kind, as M. von Wrangell has shewn to be the case to the north of the Siberian Islands, and as by strict analogy we should be justified in expecting; unless, indeed, other land should exist to the north of the Parry group, making that portion of the ocean also a land-locked sea.

Setting aside the possibility of the existence of unknown land, the probability of an open sea existing to the north of the Parry Islands, and communicating with Behring Straits, appears to rest on strict analogical reasoning. The distance of either group to Behring Straits is nearly the same. It cannot be doubted, that by calling again into action the energy, and the other admirable qualities which have been fostered and displayed in the Arctic voyages, and by persevering through a succession of seasons, a vessel might be successfully forced from the Atlantic to the Pacific, through that confined and encumbered portion of the sea, in which all the recent attempts have been made; and that this would be deemed, and deservedly deemed, an achievement of no ordinary character; but who, that reflects on the interest which has been excited in this country for two centuries and a half, by the question of a north-west passage, — on the heroic performances of the earlier navigators, in their frail and insufficient vessels; and on all the efforts of modern times; can forbear to wish that the crowning enterprise of so much exertion and so many hopes may be more suitable to those expectations of a 'free and navigable' passage, which formed the reasonable basis of this long-cherished project?"

Surely these considerations will not be lost sight of by the British nation and government. The analogies are so obvious, and the reasoning so cogent, that we feel confident another expedition need only be undertaken under competent auspices, to reward and crown, in this respect, all the efforts of centuries.

The Introduction, of a hundred and thirty-seven pages, is a clear and interesting résumé of the Russian expeditions from the year 1600, and is full of curious particulars as well as of general intelligence. For instance, we are told in remarks upon Hedenström's voyage: —

"The nearer we approach the Arctic shore, the more scanty and diminutive the trees become. As far as Verchojanak we still find larch-trees of good size. Beyond the 70th degree neither trees nor shrubs are met with. He gives some interesting particulars respecting the mammoth-bones, the peculiar production of Siberia, and more particularly of the northern islands. According to his account, these bones or tuaks are less large and heavy the further we advance towards the north, so

from the south to the north side of Melville Island, the largest of the group, in May 1830, did not go off the land on the north side."

"It must be borne in mind that 'the north-west passage,' and 'the determination and survey of the north coast of America,' are distinct geographical problems; the latter, in which the name of Franklin stands pre-eminent, and which, by means of the recent highly praiseworthy exertions of the Hudson's Bay Company, is now nearly completed, is one of the collateral fruits of the interest originally excited by the question of 'the north-west passage.'"

that it is a rare occurrence on the islands to meet with a tusk of more than three pood in weight, whereas on the continent, they are said often to weigh as much as twelve pood. In quantity, however, these bones increase wonderfully to the northward, and, as Sannikow expresses himself, the whole soil of the first of the Lachow Islands appears to consist of them. For about eighty years the fur-hunters have every year brought large cargoes from this island, but as yet there is no sensible diminution of the stock. The tusks on the islands are also much more fresh and white than those of the continent. A sand-bank on the western side was most productive of all, and the fur-hunters maintain, that when the sea recedes after a long continuance of easterly winds, a fresh supply of mammoth-bones is always found to have been washed upon this bank, proceeding apparently from some vast store at the bottom of the sea. In addition to the mammoth, the remains of two other unknown animals are found along the shore of the Polar Ocean. The head of one of these bears a strong resemblance to that of the rein-deer; differing from it in the size and form of the antlers, which descend and turn up towards the extremity. The head of the other animal is generally thirty-one inches long, and twelve inches broad; the nose is bent downward, and shews several rows of bony excrescences. Near these last-named skulls something like the claw of an enormous bird is generally found. These claws are often three English feet long, flat above, but pointed below, the section presenting a triangle. They appear to have been divided into joints throughout their whole length, like the claws of a bird. The Jukahiri, who make use of these horny claws, to give increased force to their bows, maintain that the head and claws have both belonged to an enormous bird, respecting which they relate a number of marvellous stories.\*

M. von Wrangell's own expedition was planned in order to make an accurate survey of the north-west coast of Siberia, between the Jana and the Kolyma, and as far as the Schelagskoi Noss, including an examination of the islands in the Arctic Ocean already referred to. It rendezvoused at Irkuzk and descended the Lena towards the sea. It is stated:—

"The further north we proceeded, the more desolate the shores of the Lena became in every respect. We had seen at Olekma the last traces of either field or garden cultivation; beyond it the natives subsist entirely on the produce of their cattle, hunting, and fishing. There are scarcely any settlements except the post-stations, and the few inhabitants appear miserably off. Those who came to us were in rags, and bowed down by want and sickness. This is especially the case with the Russian settlers, who are found as far north as within fifty wersts of Jakuzk. Further north the population consists entirely of Jakuti, who, as the true aborigines, know how to encounter the climate better, and suffer less from its severity and privations.

I will notice here, in passing, a few of the principal characteristics of this people. Their countenance and language fully confirm the tradition of their descent from the Tartars.† They are properly a pastoral people, whose

chief riches consist in the number of their horses and horned cattle, on the produce of which they subsist almost entirely. But the abundance of fur-animals in their vast forests, and the profit which they can make by selling them to the Russians, have turned a large part of their attention to the chase, of which they are often passionately fond, and which they follow with unwearied ardour and admirable skill. Accustomed from infancy to the privations incidental to their severe climate, they disregard hardships of every kind. They appear absolutely insensible to cold, and their endurance of hunger is such as to be almost incredible. Their food consists of sour cows' milk, and mares' milk, and of beef, and horse-flesh. They boil their meat, but never roast or bake it, and bread is unknown among them. Fat is their greatest delicacy. They eat it in every possible shape; raw, melted, fresh, or spoilt. In general they regard quantity, more than quality, in their food. They grate the inner bark of the larch, and sometimes of the fir, and mix it with fish, a little meal and milk, or by preference with fat, and make it into a sort of broth, which they consume in large quantities. They prepare from cows' milk what is called the Jakutian butter. It is more like a kind of cheese, or of curd, and has a sourish taste; it is not very rich, and is a very good article of food eaten alone. Both men and women are passionately fond of smoking tobacco. They prefer the most pungent kinds, especially the Circassian. They swallow the smoke, and it produces a kind of stupefaction which nearly resembles intoxication; and if provoked when in this state, the consequences are dangerous. Brandy is also used, though the long inland carriage renders it extremely dear. The Russian traders know how to avail themselves of these tastes in their traffic for furs."

Proceeding onward:—

"On the 26th of September we reached the first post-station, called Baralas. It is 157 wersts from the mountains we had passed, and is, according to our observations, in latitude 65° 51'. We were delighted to find here a good roomy jurte, prepared for travellers, and kept in excellent order. Near the door we saw pieces of transparent ice, ranged along on clean snow, ready for the soup or the tea-kettle. The interior was well swept, clean hay was laid on the benches round the walls, and a bright fire was blazing on the hearth. The windows were closed by smooth, transparent panes of ice, carefully cemented with the same ready material. After being nine days and nights in the open air, in snow and cold, unable to take off our clothes, or to wash ourselves, lest we should be frost-bitten, we thought ourselves in a palace, and a thorough toilette seemed to give us new life. Our worthy host appeared hardly able to appreciate, for want of personal experience, our hearty thanks for so great an enjoyment. He then placed before us a good meal of Siberian delicacies, such as frozen Jakutian butter without salt, struganina, or thin flakes of frozen fish, and lastly, fresh raw reindeer marrow. We were too well pleased with our host to shew any dislike to his entertainment. In the sequel we grew more used to such fare, and I own I now prefer flakes of fresh struganina, before it thaws, seasoned with salt and pepper, to dressed fish. \* \* \* At midnight, on the 10th of October, we reached the little town of Sashiworsk, on the right bank of the Indigirka, 415 wersts from Tabalog. During the journey the cold had never been less than 4°, and we often had it 22°.

We had passed our nights in ruined, deserted cottages, and in the Powarni. The plains were still bare of snow, chiefly from the effect of the constant winds. In 1786, a short time previous to the expedition of Captain Billings, Sashiworsk, which before only consisted of a few huts, was raised to the rank of a district town by the Empress Catherine II. The presence of the authorities gave it a temporary importance; their subsequent withdrawal has allowed it to fall back to its original insignificance. It has still a good church, and four or five cottages inhabited by the priest and his brother, the native overseer of the post-station, and two Russian families. But poor as this place is, it has one feature which renders it well deserving of notice, in the person of the clergyman, who is known far and wide by the name of Father Michel. At the time of our visit he was eighty-seven years of age, and had passed about sixty years here as deacon and as priest, during which time he has not only baptised 15,000 Jakuti, Tungusi, and Jukahiri, but has really made them acquainted with the leading truths of Christianity; and the fruits of his doctrine, his example, and his counsels, are visible in their great moral improvement. Such is the zeal of this truly venerable man for the extension of the Gospel among the inhabitants of these snowy wastes, that neither his great age, nor the severity of the climate, nor the countless other difficulties of the country, prevent his still riding above 2000 wersts a-year, in order to baptise the new-born children of his widely-scattered flock, and to perform the other duties of his sacred calling; as well as to assist his people in every way he can, as minister, as teacher, as friend, and adviser, and even as physician. Yet he sometimes finds time and strength to go to the neighbouring hills to shoot argali and other game; and has bestowed so much pains and skill on his little garden, that he has reared cabbages, turnips, and radishes. He placed before us sour krout soup, and fresh-baked rye-bread, and his pleasure in seeing us enjoy these excellent and long-untested national dishes, was at least as great as our own. He gave us another kind of bread of his own invention. It is made of dried fish grated to a fine powder, in which state it will keep a long time, if not allowed to get damp; mixed with a small quantity of meal, it makes a well-tasted bread. \* \* \* We had thus travelled eleven thousand wersts from St. Petersburg in 224 days, and had reached the first point to which we were bound. We were arrived at Nishne Kolymak, a fishing village, destined to be our head-quarters for the next three years.

The vegetation of summer is scarcely more than a struggle for existence. In the latter end of May the stunted willow-bushes put out little wrinkled leaves, and those banks which slope towards the south become clothed with a semi-verdant hue: in June the temperature at noon attains 72°; the flowers shew themselves, and the berry-bearing plants blossom, when sometimes an icy blast from the sea turns the verdure yellow, and destroys the bloom. The air is clearest in July, and the temperature is usually mild. But, as if to imbitter to the inhabitants of this dreary region this semblance of summer, and to cause them to wish for winter again, millions of mosquitoes darken the air, and oblige every one to take refuge in the thick and pungent smoke of the dymokuries,\* which affords protection from these

\* "Dr. Kyber had frequent opportunities of examining these supposed heads and claws of a bird, and believes them to be the remains of a species of rhinoceros."

† "According to this tradition, their ancestor was a Tartar, named Sachalar, who came from his own country on the other side of the mountains, to Kirenga on the Lena, where he settled and married a Tungusian woman; the Jakuti still call themselves Sachalary."

\* "These dymokuries are large heaps of fallen leaves, moss, and damp wood; the thick smoke which comes

tormentors. But as every thing in nature has a beneficent purpose, and all disadvantages are compensated by some good, these insects render an essential service to the inhabitants, by forcing the rein-deer to leave the forests, and to take refuge in the cold open plains near the sea. This they commonly do in troops of many hundreds, or even thousands; the hunters then lie in wait for them, especially as they cross the rivers and lakes, and kill numbers without difficulty. The mosquitoes render also another service in preventing the horses from straying away in the vast plains, where they feed without keepers. Their natural instinct teaches them to keep near the dymokuries, which protect them from their enemies. One sees them grazing on the lee-side of these glimmering heaps, in the cover of the smoke. When the pasture is fed off, the smoke-heaps are established in a fresh place. They are generally enclosed by a slight fence, to prevent the horses from coming too near the fire. In summer the rolling of thunder-storms can be heard in the mountains, but they have little influence on the great plains. Winter, properly so called, prevails during nine months of the year. In October the cold is somewhat mitigated by thick fogs, and by the vapour rising from the freezing sea; but in November the great cold begins, and in January increases to 65°. Then breathing becomes difficult; the wild rein-deer, that citizen of the polar region, withdraws to the deepest thicket of the forest, and stands there motionless, as if deprived of life. The night of fifty-two revolutions of the earth is relieved by the strong refraction, and by the whitened surface of the snow, as well as by frequent auroras. On the 28th of December a pale twilight begins to be visible at noon, but is not sufficient to dim the stars. As the sun returns, the cold becomes even more sensible, and the intensity of frost, which accompanies the rising of the sun in February and March, is especially penetrating. Perfectly clear days are extremely rare in winter, because the sea-winds, which always prevail, bring with them continual vapours and fogs, which are sometimes so intense as wholly to conceal the stars of the deep blue polar sky. These thick fogs are called Morrok. They prevail least in September. There is a remarkable phenomenon known here by the name of Teplot Weter (the warm wind), blowing from the south-east by south; it sometimes begins suddenly, when the sky is quite clear, and in the middle of winter raises the temperature, in a short time, from -47° to +35°; so that the plates of ice, which are the substitute for glass in the windows, begin to melt; in the valleys of the Aninuj, the warm wind is frequently felt; its influence does not extend to the west of Cape Tschukotskoj. It is seldom of longer continuance than twenty-four hours. Though, from all that has been said, the climate is one of the most severe and unkindly; yet it must be owned that it is not, on the whole, prejudicial to health.

"The poverty of vegetation is strongly contrasted with the rich abundance of animal life. Countless herds of reindeer, elks, black bears, foxes, sables, and grey squirrels, fill the upland forests; stone foxes and wolves roam over the low grounds. Enormous flights of swans, geese, and ducks, arrive in spring, and seek deserts where they may moult and build their nests in safety. Eagles, owls, and gulls,

from them drives away the mosquitoes; they are placed both in the pastures and near the houses, so that the inhabitants pass the whole mosquito season in a constant cloud of thick and pungent smoke."

pursue their prey along the sea-coast; ptarmigan run in troops amongst the bushes; little snipes are busy along the brooks, and in the morasses: the social crows seek the neighbourhood of men's habitations; and, when the sun shines in spring, one may even sometimes hear the cheerful note of the finch, and in autumn, that of the thrush.\* Yet all this manifold life cannot alleviate the dreariness of the desert, or repress the thought, that here is the limit of the animated world. The animals either visit or inhabit these icy deserts in obedience to the unerring laws of instinct; they have no choice to exercise. But what induced man to fix himself in this dreary region? I speak not of the few Russians, whose stay for a limited period is determined by the hope of gain, but of the tribes who came here without such motive, and who now dwell in these countries. Nomade races, under milder skies, wander from one fruitful region to another, gradually forget the land of their birth, and prefer a new home. But here there is nothing to invite. Endless snows and ice-covered rocks bound the horizon. Nature lies shrouded in almost perpetual winter. Life is a continual conflict with privation, and with the terrors of cold and hunger. What led men to forsake more favoured lands for this grave of nature, which contains only the bones of an earlier world? It is in vain to ask the question of the inhabitants, who are incessantly occupied with the necessities of the present hour, and amongst whom no traditions preserve the memory of the past. Nothing definite is known concerning the inhabitants even at the not very remote epoch of the conquest of Siberia by the Russians. I have indeed heard an obscure saying, 'That there were once more hearths of the Omoki on the shores of the Kolyma, than there are stars in the clear sky'; there are also remains of forts, formed of trunks of trees, and tumuli; the latter especially near the Indigirka; both may be supposed to have belonged to these Omoki, who have now disappeared. From the little I could gather on the subject, it would seem that the Omoki were a numerous and powerful people; that they were not nomades, but lived in settlements along the rivers, and supported themselves by fishing and hunting. Another numerous tribe, the Tschukotschi, or Tschuktschi, appear to have wandered over the Tundra with their herds of reindeer; they have left their names to features of the country; as for example, the Malaja, and Bolschaja Tschukotscha, the greater and the lesser Tschuktschi rivers. Both races have disappeared; the Omoki have probably perished by want and sickness, and the Tschuktschi have partly wandered away, and partly become confounded amongst new arrivals, and form with them the present scanty population of the country. In the whole Kolyma circle there are now 325 Russian peasants, citizens, and Cossacks, 1034 Jakuti, 1139 Jukahiri, and other races; in all 2498 males, of whom 2173 pay jassak. The jassak, or tribute, consists of 803 foxes and 28 sables (which may be estimated at 6704 roubles), and 10,847 roubles in money, making on an average about eight roubles to be paid by every male of the Jakuti, and other tribes.

Spring

\* "According to the observations of Dr. Kyber, the only birds which winter here are the ptarmigan, the common crow, the bald eagle, and the snowy owl. The snow-bunting and the Kamtschatkan thrush (*Motacilla caliope*) appear early in April. The lapwing, common snipe, and ring-plover, arrive later; and in May, swans, four kinds of geese, and eleven kinds of ducks, make their appearance."

is, on the Kolyma, the severest season of the year; the provisions which were laid up in summer and autumn have been consumed in the long winter; the fish, which had withdrawn into the deepest parts of the rivers and lakes, during the intense cold, have not yet reappeared. The dogs are often too much exhausted by the winter work, and insufficient food, to be fit for chasing the reindeer and elk over the vast, the last favourable opportunity which the early spring affords. A few ptarmigan are snared, but they are quite insufficient to satisfy the general want. Tungusi and Jukahiri come in parties from the Tundra, and from the Aninuj, to the Russian villages on the Kolyma, to escape starvation. One sees them, like wandering phantoms, pale, without strength, scarcely able to walk; they throw themselves greedily on any remains of bones, skin, or aught else which may in any way alleviate the pangs of hunger; but there is little comfort for them in the villages, where want reigns likewise; the inhabitants are obliged to have recourse to the small remains of the provisions designed for their dogs, many of which are often starved in consequence."

The dogs are of infinite service in these wild regions, and the stories of them are often marvellous:—

"Of all the animals that live in the high north latitudes, none are so deserving of being noticed as the dog. The companion of man in all climates, from the islands of the South Sea where he feeds on bananas, to the Polar Sea where his food is fish, he here plays a part to which he is unaccustomed in more favoured regions. Necessity has taught the inhabitants of the northern countries to employ these comparatively weak animals in draught. On all the coasts of the Polar Sea, from the Obi to Behring's Straits, in Greenland, Kamtschatka, and in the Kurile Islands, the dogs are made to draw sledges loaded with persons and with goods, and for considerable journeys. The dogs have much resemblance to the wolf. They have long, pointed, projecting noses, sharp and upright ears, and a long bushy tail; some have smooth, and some have curly hair; their colour is various—black, brown, reddish-brown, white and spotted. They vary also in size; but it is considered that a good sledge-dog should not be less than two feet seven and a half inches in height, and three feet three-quarters of an inch in length (English measure). Their barking is like the howling of a wolf. They pass their whole life in the open air; in summer they dig holes in the ground for coolness, or lie in the water to avoid the mosquitoes; in winter they protect themselves by burrowing in the snow, and lie curled up, with their noses covered by their bushy tails. The female puppies are drowned, except enough to preserve the breed, the males alone being used in draught. Those born in winter enter on their training the following autumn, but are not used in long journeys until the third year. The feeding and training is a particular art, and much skill is required in driving and guiding them. The best-trained dogs are used as leaders, and as the quick and steady going of the team,

"When the warmth of the sun in spring thaws the surface of the snow, it freezes again at night, and forms a thin crust of ice, which is just strong enough to bear a light sledge with its team of dogs. This state of the snow is called nast. The hunters profit by it to pursue the elks and reindeer by night; and as the weight of these animals causes them to break through, they fall an easy prey. The nast continues to form during a longer or shorter period, according to the more or less sheltered locality, and according to the thickness of the snow. It is not formed every year. During the whole time of our stay there was no nast in the district."

usually of twelve dogs, and the safety of the traveller, depend on the sagacity and docility of the leader, no pains are spared in their education; so that they may always obey their master's voice, and not be tempted from their course when they come on the scent of game. This last is a point of great difficulty; sometimes the whole team, in such cases, will start off, and no endeavours on the part of the driver can stop them. On such occasions we have sometimes had to admire the cleverness with which the well-trained leader endeavours to turn the other dogs from their pursuit; if other devices fail, he will suddenly wheel round, and by barking, as if he had come on a new scent, try to induce the other dogs to follow him. In travelling across the wide tundra, in dark nights, or when the vast plain is veiled in impenetrable mist, or in storms or snow-tempests, when the traveller is in danger of missing the sheltering powarna, and of perishing in the snow, he will frequently owe his safety to a good leader; if the animal has ever been in this plain, and has stopped with his master at the powarna, he will be sure to bring the sledge to the place where the hut lies deeply buried in the snow; when arrived at it he will suddenly stop, and indicate, significantly, the spot where his master must dig. Nor are the dogs without their use in summer; they tow the boats up the rivers; and it is curious to observe how instantly they obey their master's voice, either in halting or in changing the bank of the river. On hearing his call they plunge into the water, draw the towing-line after them, and swim after the boat to the opposite shore; and, on reaching it, replace themselves in order, and wait the command to go on. Sometimes even those who have no horses will use the dogs in fowling excursions, to draw their light boats from one lake or river to another. In short, the dog is fully as useful and indispensable a domestic animal to the settled inhabitant of this country, as the tame rein-deer is to the nomade tribes. They regard it as such.\* We saw a remarkable instance of this during the terrible sickness which, in the year 1821, carried off the greater part of these useful animals. An unfortunate Juhakir family had only two dogs left out of twenty, and these were just born, and indeed still blind. The mother being dead, the wife of the Juhakir determined on nursing the two puppies with her own child, rather than lose the last remains of their former wealth. She did so, and was rewarded for it, for her two nurselings lived, and became the parents of a new and vigorous race of dogs. In the year 1822, when most of the inhabitants had lost their dogs by the sickness, they were in a most melancholy condition; they had to draw home their own fuel; and both time and strength failed them in bringing home the fish which had been caught in distant places; moreover, whilst thus occupied, the season passed for fowling and fur-hunting; and a general and severe famine, in which numbers perished, was the consequence. Horses cannot be made a substitute; the severity of the climate, and the shortness of the summer, make it impossible to

\* "It was once unwisely proposed to forbid the keeping of dogs, on account of the quantity of fish required for their support which is thus withdrawn from the food of the inhabitants. Each sledge, of twelve dogs, requires daily from fifty to seventy herrings. But, if this measure had been adopted, so far from increasing the quantity of food at the command of the inhabitants, it would have deprived them of one of their chief means of procuring subsistence, as was most clearly proved at the time of the great mortality amongst the dogs in 1821 and 1823. This highly injudicious proposal was happily rejected by the government."

provide sufficient fodder; the light dog can also move quickly over the deep snow, in which the heavy horse would sink. Having thus described the out-of-door life and employments of the people of this district, let us accompany an individual into his habitation, at the close of summer, when he and his family rest from all these laborious efforts, and enjoy life after their manner. The walls are caulked afresh with moss, and new plastered with clay, and a solid mound of earth is heaped up on the outside as high as the windows. This is accomplished before December, when the long winter nights assemble the members of the family around the hearth. The light of the fire, and that of one or more train-oil lamps, are seen through the ice-windows; and from the low chimneys rise high columns of red smoke, with magnificent jets of sparks, occasioned by the resinous nature of the wood. The dogs are outside, either on or burrowed in the snow. From time to time their howling interrupts the general silence; it is so loud as to be heard at great distances, and is repeated at intervals, usually of six or eight hours, except when the moon shines, when it is much more frequent."

*The Quiet Husband.* By Miss Ellen Pickering, author of the "The Merchant's Daughter," "The Prince and the Pedlar," "Nan Darrell," "The Fright," &c. 3 vols. 12mo. London, 1840. Boone.

WE always welcome a novel from this pen, feeling certain of being entertained, and of having but little to criticise (we mean in the harsh sense of that word—finding fault). Sketching from nature is the authoress's forte, and she wisely adheres to it;—it is a wide field, and its subjects can never be exhausted.

Eminently feminine, we trace the woman in every page. The quick eye and clear intellect to observe, and the ready pen to convey to others in a pleasant manner the impressions received, are the gifts of which Miss Pickering makes such good use. The story is domestic, and the locality confined. A few families, of various natures and habits, form the principal *dramatis personæ*; and the *dénouement*, although expected, is delayed by so many *contre-temps*, that the reader's interest never flags. The heroine, the orphan of a ruined father, is received into the bosom of a warm-hearted and generous family. We select her for our first extract:—

"Cecil's mind was stronger than the frame in which it dwelt; and yet it preyed upon that frame, rendering it weaker and weaker; but this was not to be permitted unrebuked. Her severe and sudden losses, her delicate health, and the months spent in retirement, had strongly impressed on her mind the instability of human life and human happiness; suffering had been a bitter but a useful medicine, bringing to the mind a more healthful tone, though it left a paleness on her cheek. In her prosperity young, rich, and beautiful; courted, followed, flattered;—in the full flow of youthful spirits, she had never dreamed of suffering, but thought to pass through life sportive and happy—a flower flung upon the stream of fortune, borne by the current between lovely banks into a peaceful haven, without an effort of her own; and though naturally endowed with strong and generous affections, with gentle pity, and with noble sympathies; yet still, unknown to herself (for she knew little then of the heart's deceitfulness), pride and presumption had mingled with her higher qualities, marring the beauty of her character. In her poverty she had better learnt to know herself, her duties, and her faults."

She no longer considered happiness as hers of right; and if she still wept when sorrow came, it was in sadness and submission, not in rebellious passion. She had looked more narrowly into the situation of those around her; no longer a spoiled child and flattered heiress, she now saw herself but a unit in one mighty total; and instead of expecting that all should run according to her pleasure (she standing above grief the while, untouched by suffering), she admitted that her fate must be twined in with that of others;—millions of atoms blending in one gigantic whole—none holding on its course alone; but each and all tending to one end;—on earth the grave—beyond an immortality of bliss or woe. She was no longer an object of envy, above the pity of those around her; she had suffered—had needed that pity; and had found it. The lot of man was suffering; and as she had met with pity, so must she pity others. She had no right to withdraw from the active duties of life, and pine away in lonely misery, because the golden visions of her youth had all departed. She had no right to yield to grief unchecked; she felt with the noble Elliot 'that sorrow was selfish,' if it rendered her less willing, or less able to succour others; selfish to man, ungrateful to her Maker. She was not placed on earth only to eat, and drink, and sleep, and sport away a life as insects sport away a sunny hour; she had higher powers—was called to higher duties;—she had comparatively little left—but that little must not be wasted in impotent repining. Such were the lessons taught to Cecil by her losses, but as yet she had not learnt them fully; she felt their wisdom, but they were not always the rule of her actions, and at times she would long, with a wild and passionate longing, to be with those who had gone before—to rest in the silent grave where sorrow was not known; and then she would bow her head in shame at this impatience at her lot, a lot still so full of blessings."

The wayward Robert Ashton is cleverly portrayed; his is an uncommon, but not unnatural character. The old Bailiff Flinter is also a capital sketch; we find it difficult to give an idea of him by quotation, as he only appears occasionally on the scene, and then but for a short while:—

"'You are just the person I want to speak with, Flinter,' said Mrs. Ashton, meeting him unlookingly before his ill-humour had passed away. 'Well, ma'am, and what do you please to want with me?' inquired Flinter, drawing up of a sudden, for, blinded by his displeasure, he had nearly walked over his mistress without perceiving her, looking more stiff and unconversable than ever. 'I want to know what you have done about Purcell's pigs?'—'Threatened to put them in the pound, ma'am.' 'You threatened that long since, why have you not done it?'—'Cause I can't catch them in the turmits, ma'am.' 'You don't keep a sharp look-out.' 'If others kept as sharp a look-out about other things, things would go better, ma'am.' 'I don't know what you mean by that, Flinter, unless that your master never looks into any thing.' 'I did not mean nothing at all about master, ma'am.' 'It does not matter what you mean. But have you been to see the harrow at Mrs. Praed's?'—'No, ma'am.' 'And why don't you go?' I spoke to you about it more than six months ago.' 'I ha'n't got time, ma'am.' 'Not time! I should like to know what you find to do.' 'Every body is busy at this election now, ma'am.' 'Election! What have you to do with the election? The fact is, you don't

choose to go.' 'Yes, that is just it; you have hit upon it, ma'am.' 'I thought as much, though you ought to be ashamed to own it. You are the most bigoted, obstinate person I know! I don't doubt your honesty—' 'Doubt my honesty, ma'am? I should think not indeed! No one ever yet doubted Thomas Flinter's honesty,' exclaimed the sturdy bailiff flaming out into open passion. 'If you doubt it, ma'am, I'll go—that's all.' 'Nonsense, Flinter; I said that I did not doubt it,' replied Mrs. Ashton, who was always a little alarmed by his threats of going, knowing that the whole family would in such a case take part against her. 'It is very provoking that you never will try a new thing, only because it is new, when I take such pride and pleasure in the farm, and wish to see it the best managed in the country.' 'Well, ma'am, and so it is; expense considered, it pays better than any for thirty miles round. And I don't like new things, that is for certain; more especially that Fab-nab-washerwoman, as you was a-telling me about the other day.' 'Well, I won't ask you to use that,' observed Mrs. Ashton with a heightened colour, fearful lest Flinter should find out the fact that the highly lauded Pferdknabewasserung was a hoax, shrewdly suspected to have been planned, if not executed, by Robert. 'I won't say any thing more about it.' 'Perhaps that might be as well, ma'am; but you knows best,' replied Flinter, with a look which still further heightened her ruddy bloom. The blunt and taciturn bailiff had much more penetration than people gave him credit for. 'I have been reading a book lately written by a very clever man about soils, and the crops that suit them best; and I have decided that Tiler's field shall be put into wheat next year,' continued Mrs. Ashton, taking no notice of the bailiff's comment, and speaking fast to cover her confusion. 'You have it in barley now, which is wasting its goodness. Remember what a capital crop of wheat you had there last year; and do try wheat again this next.' 'Wheat arter barley! and wheat the year afore! Who ever heard of such a thing?' almost shouted the bailiff, plunging his knotted stick some inches into the earth in the energy of his disgust and anger, drawing his feet together, and standing stiff and starch, with head erect, like an awkward recruit at drill. 'It may be a very good plan, though you have not heard of it; for you never read any farming books.' 'Larn farming from reading, ma'am!' exclaimed Flinter contemptuously. 'Yes, much may be learned from reading; and, at any rate, I insist on Tiler's field being tried in wheat next year.' 'I could not in my conscience, ma'am; it would be a robbing of master, and I could not venture to shew my face among the farmers—they would so jeer.' 'Nonsense, Flinter, I will listen to no more folly. You can say I ordered it.' 'You ordered it! Well then, ma'am, it comes to this—be you to manage the farm, or be I? If I, then it shan't be wheat next year—that's poz; if you, then I'll go and wish master and the family good-by directly: for I won't stay where I can be of no use, receiving wages for nothing—that would not be honest. Lord Fitz Elwyn will take me any day, and jump to have me too—I knows that.' 'You are so hot and headstrong, there is no getting you to listen to reason,' observed Mrs. Ashton, excessively provoked; and yet afraid to persist in having Tiler's field cropped as she wished. 'There is no reason in having wheat arter barley; and no reasonable person would say so.' 'It is of no use disputing the point, you are so obstinate, and always will have your

own way,' said Mrs. Ashton, walking off in great vexation."

We cannot quite agree with our fair writer's notion of the courtesy of election rivals to each other, but such things *may be*, though certainly rare. We have but few faults to find, and these only affect slight specks. The introduction of the rich old uncle in disguise is unnecessary, and a hackneyed incident. The sudden silence of Willerton, also, in his last love affair, though requisite for the plot's sake, is not in keeping with the previous portions of his character. We mention trifling blemishes like these, because we are convinced that the authoress has talent enough to bring about effects without straining causes. We cannot resist one little bit more of old Flinter, with which we close our notice of these agreeable volumes, and with which they also close:—

"'Oh! Flinter, you are acquiring a dangerous taste for novelties; the next thing you will be trying the Fab-nab-washerwoman, that you were talking to me about.' 'Ah! my lord; that Fab-nab-washerwoman was a famous thing for me,' exclaimed the honest bailiff, every show of embarrassment gone, and his little eyes twinkling with mischievous triumph. 'It has turned out a hum, as I always said it would; and let missus be teasing ever so bad, I have only to ax her about that, and she is quiet directly, and lets me do every thing as I like; and so now when I knows how I can stop her, I lets her go on the longer, for missus is a good woman in the main, if she would but leave me and the farm alone. She have a'most kept the Purcells ever since he broke his arm; and the pigs don't go in the turmits now. Yes, yes; that Fab-nab-washerwoman was a famous thing for me.'"

*Glencoe; or, the Fate of the Macdonalds. A Tragedy, in Five Acts.* London, 1840. Moxon.

THE domestic and social massacre of Glencoe does not appear to us to be a good subject for the drama. Multitudinous murder has no striking or salient point for the tragic muse, which must select its individual objects, and on them lavish the arts of awe, pathos, and horror. A sanguinary riot in the crowded streets is appalling, but it is not fit for a painting; but take one or two individuals, and expose them to peril and assassination, and your action is distinct, your canvass effective. Sterne judiciously shut up his single captive in his dungeon—that lone sufferer appeals more forcibly to the imagination than all the prisoners of war at Verdun, however severe their endurance and calamitous their fate.

Mr. Serjeant Talfourd had too strong a feeling of this truth to endeavour to found his tragedy on the dismal catastrophe of Glencoe alone; the indiscriminate slaughter of men, women, and children—the aged chief, the manly warrior, the rising stripling, the helpless virgin, the suckling mother, and the infant at the breast. Such monstrous deeds may of necessity form the records of history, whilst nature recoils at them; but the poet, especially the dramatic poet, could make but poor use of such materials, and must leave them, unwrought upon, in their own dark and bloody lineaments. To obviate his difficulty, the author has invented several characters, and placed them in circumstances which are affected by those of the real event. Thus Halbert, the son of a Macdonald who had been slain in a contest for the chieftainship of the clan by Mac Ian, its now acknowledged head, is represented as having resigned the ambitious pretension of his

family in consequence of a supernatural warning, and retired into a moody seclusion with his widowed mother, who fosters Helen Campbell, a niece of Glenlyon, under whose orders this fiendish work was perpetrated. He also converts into an instrument in his hands Henry, a younger brother of Halbert, who has left his native glen to push his fortunes, and returns a gay and gallant officer in the regiment of Argyle, commanded by Glenlyon.

In portraying these personages, Mr. Talfourd seems to us to have been eminently happy in his conception and execution of Halbert, successful with Helen, and more happy in the conception than in the execution of Henry. Halbert is very fine. His aspirations have been crushed, and he nurses his regrets in the deep and lonely solitudes of Glencoe;—that glen, where every rock and every mountain, every ravine and every corrie, the headlong torrent and the o'ershadowed loch, have a voice to inspire thoughts of melancholy and sublimity—where a soul becomes a mighty blank expanded to the impression of some other and uncontrollable passion. That passion is the love of Helen, at once so fervent and so natural, that he confides in its return as a thing of certain destiny, and never questions its reality, nor seeks to ascertain its mutual existence, from the mouth of her who holds him in such matchless bondage. This is the love, not of silken society, which would flirt with and "propose," but the profounder sentiment inspired in a noble breast, depressed by evil prophecies, having but one hope, and every feeling exalted by the romantic and wonderful scenery in which they are indulged and cherished. That Helen should yield to the mastering of this spirit is also perfectly in nature, though her younger affections are bestowed upon her childish companion Henry. With Henry we are not so well satisfied; but much may be said on both sides, and we are not disposed to enter upon the nice inquiry, why or why not, in Helen's mind, the ruffling soldier should be preferred to his glorious brother? On maiden fancies, lightness and gallantry may possess claims superior to abstraction and a semblance of austerity; and a Campbell was not so likely as a Macdonald to abjure the suitor because he had been induced to join the hostile ranks of the new king William.

Under these considerations we not only acknowledge the poetical beauties scattered through this play, but the general truth which invests its characters and conduct. Even in the quarrels of the brothers, which seem at first to be carried to an extreme of rashness and inconsistency, we can find some apology, from the hot-bloodedness and disregard of life which belonged to the time. And so of other points in the composition which might be obnoxious to criticism, but which could not be fairly criticised without going more at length into the *pros* and *cons* than we have room for in our pages.

We have, therefore, only to select a few quotations to shew that true poetry is as prevalent in *Glencoe* as in any of the author's preceding productions:—

"Helen. There's not a day but bears its blessing on its light. If Nature doles Her gifts with sparing hand, their rareness sheds Endearments her most bounteous mood withhold From greenest valleys. The pure rill which casts Its thread of snow-like lustre o'er the rock, Which seems to pierce the azure sky, connects The thoughts of earth with heaven, while mightier floods Roar of dark passions. The rare sunbeam wins For a most slight existence human care, While it invests some marble heap with gleams Of palaced visions. If the tufts of broom Whence Fancy weaves a chain of gold, appear

On nearer visitation thinly strewn,  
Each looks a separate bower, and others shade  
To its own group of fairies. The prized harebell  
Wastes not its dawning azure on a bank  
Rough and confused with loveliness, but wears  
The modest story of its gentle life  
On leaves that love has tended: nay, the heath,  
Which, slowly from a stunted root, unfolds  
Pale lilac blossoms,—image of a maid  
Rear'd in a solitude like this,—is blest'd,  
Instead of sharing with a million flowers  
One radiant flush,—in offering its faint bloom  
To fond eyes. Say not again, dear lady,  
That joy but seldom visits these old walls.

*Halbert.* You shall hear me while I speak  
Of that which nearly touches you, as one  
Of a small—branded—poor—illustrious race;  
Who boast no fertile pastures; no broad lake  
Studded with island woods, which make the soul  
Effeminate with richness, like the scenes  
In which the baffled Campbells bid their shame,  
And scorn'd their distant foes. Our boasts are few,  
Yet great:—a stream which thunders from its throne,  
As when its roar was mingled with the voice  
Of eldest song, from age to age retain'd  
In human hearts;—wild myrles which preserve  
Their hoard of perfume for the dying hour  
When rudeness crushes them;—rocks which no flowers  
Of earth adorn, but, in themselves austere,  
Receive The Beautiful direct from Heaven,  
Which forces them to wear it,—shows their tops  
Refined with air; compels their darkest steps  
Reluctant to reflect the noontide sun  
In sheeted splendour,—weathers around them clouds  
In glorious seasons, which, while they float  
Slowly, or rest beneath the sable heights,  
In their brief fleecy loveliness grow proud  
To wait upon The leading,—And the right  
To walk this glen with head erect, you sold  
For bounties which Argyle could offer!

*Helen.* Not forgotten,  
Nor have the years been heavy: when I said so,  
I was most thankful. Pardon me, sweet lady,  
But when with Henry I recall old times,  
I look across the intervening years  
As a low vale in which fair pastures lie  
Unseen, to gaze upon a sunlit bank  
On which my childhood sported, and which grows  
Near as I watch it. If his nature seems  
Unsoften'd by reflection,—like a rock  
Which draws no nurture from the rains, nor drinks  
The sunbeam in that lights it, yet sustains  
A plume of heather,—it is crown'd with grace  
Which wins the heart it shelters.

*Helen.* Yes;  
I then had kept such watch upon my soul,  
As had not let the shadow of a thought  
Fall on your image there; but not a word  
Of courtship pass'd between us.

*Halbert.* Not a word.  
Words are for lighter loves, that spread their flames  
Of glossy threads, which, while the air's serene,  
Hang gracefully, and sparkle in the sun  
Of fortune, or reflect the fainter beams  
Which moonlight fancy sheds; but ours—yes, OURS!—  
Was woven with the toughest yarn of life,  
For it was blended with the noblest things  
We lived for: with the majesties of old,  
The sable train of mighty griefs o'er which  
By Time's deep shadows, with the fate of kings,—  
A glorious dynasty—for ever crush'd  
With the great sentiments which made them strong  
In the affections of mankind;—with grief  
For rock-enthroned Scotland; with poor fortune  
Shared cheerfully; with high resolves; with thoughts  
Of death; and with the hopes that cannot die.

*Helen.* Hold! If you rend oblivion's slender veil  
Thus fearfully, and spectres of the past  
Glide o'er my startled spirit, it will fail  
In reason.

*Halbert.* No;—it shall cast off this cloud,  
And retain no impression save of things  
Which last for ever: for to such our love  
Has been allied. How often have we stood,  
Clasp'd on yon terrace by columnar rocks,  
Upon whose jagged crannies the sky  
With its few stars seem'd pillar'd, and have felt  
Our earthly fortunes, bounded like the gorge  
That held us, had an avenue beyond,  
Like that we gazed on; and when summer eve  
Has tempted us to wander on the bank  
Of glory-tinged Loch Leven, till the sea  
Open'd beyond the mountains, and the thoughts  
Of limitless expanse were rear'd sweet  
By crowding memories of delicious hours  
South'd by its murmur, we have own'd and bless'd  
The presence of Eternity and Home!

*Helen.* What shall I do?

*Works of Sir E. L. Bulwer.* London, 1840.

Saunders and Otley.

SINCE we reviewed the first volume of this collection of Sir Edward Bulwer's productions,

*Ernest Maltravers*, and its sequel, *Alice, or the Mysteries*, have appeared. Both bear evidence to the corrective judgment and improving hand of the author, and are charmingly illustrated by G. Cattermole, Stephanoff, and Von Holst. In 1837 and 1838 the *Literary Gazette* bore its testimony to the merits of these fine works of fiction, and it would be absurd to repeat them now. Our high estimation of the author's powers has often been put on record, and future times will do justice to them, notwithstanding the spirit of depreciation with which they have been treated by too many of his countrymen and contemporaries, which it has also been our painful duty repeatedly to notice and lament. The preface to this new edition of *Ernest Maltravers* explains so clearly the objects of the writer, and gives so interesting a glance at his publications, that we cannot do better than extract part of it for the edification of our readers:—

"However numerous the works of fiction with which, my dear reader, I have trespassed on your attention, I have published but three, of any account, in which the plot has been cast amidst the events, and coloured by the manner, of our own times. The first of these, 'Pelham,' composed when I was little more than a boy, has the faults, and perhaps the merits, natural to a very early age,—when the novelty itself of life quickens the observation,—when we see distinctly, and represent vividly, what lies upon the surface of the world,—and when, half sympathising with the follies we satirise, there is a gusto in our paintings which atones for their exaggeration. As we grow older we observe less, we reflect more; and, like *Frankenstein*, we dissect in order to create. The second novel of the present day,\* which, after an interval of some years, I submitted to the world, was one I now, for the first time, acknowledge, and which (revised and corrected) will be included in this series, viz. 'Godolphin';—a work devoted to a particular portion of society, and the development of a peculiar class of character. The third, which I now reprint, is 'Ernest Maltravers,' including the sequel, which goes by the title of 'Alice, or the Mysteries'; for the commencement and the sequel compose but one novel,—the most mature, and on the whole, the most comprehensive, of all that I have hitherto written. For the original idea, which, with humility, I will venture to call the philosophical design, of a moral education or apprenticeship, I have left it easy to be seen that I am indebted to Goethe's 'Wilhelm Meister.' But, in 'Wilhelm Meister,' the apprenticeship is rather that of theoretical art. In the more homely plan that I set before myself, the apprenticeship is rather that of practical life. And, with this view, it has been especially my study to avoid all those attractions lawful in romance, or tales of pure humour or unbridled fancy,—attractions that, in the language of reviewers, are styled under the head of 'most striking descriptions,' 'scenes of extraordinary power,' &c.; and are derived from violent contrasts and exaggerations pushed into caricature. It has been my aim to subdue and tone down the persons introduced, and the general agencies of the narrative, into the lights and shadows of life as it is. I do not mean by 'life as it is,' the vulgar and the outward life alone, but life in its spiritual and mystic, as well as its more visible and fleshly, characteristics. The idea of not only describing, but de-

veloping character under the ripening influences of time and circumstance, is not confined to the apprenticeship of Maltravers alone, but pervades the progress of *Cesarini*, *Ferrers*, and *Alice Darvil*. The original conception of *Alice* is taken from real life—from a person I never saw but twice, and then she was no longer young—but whose history made on me a deep impression. Her early ignorance and home—her first love—the strange and affecting fidelity that she maintained, in spite of new ties—her final re-meeting, almost in middle age, with one lost and adored almost in childhood—all this, as shewn in the novel, is but the imperfect transcript of the true adventures of a living woman. In regard to Maltravers himself, I must own that I have but inadequately struggled against the great and obvious difficulty of representing an author living in our own times, with whose supposed works or alleged genius, and those of any one actually existing, the reader can establish no identification, and he is therefore either compelled constantly to humour the delusion by keeping his imagination on the stretch, or lazily driven to confound the author in the book with the author of the book.\* But I own, also, I fancied while aware of this objection, and in spite of it, that so much not hitherto said might be said with advantage through the lips or in the life of an imaginary writer of our own time, that I was contented, on the whole, either to task the imagination, or submit to the suspicions, of the reader. All that my own egotism appropriates in the book are some occasional remarks, the natural result of practical experience. With the life or the character, the adventures or the humours, the errors or the good qualities, of Maltravers himself, I have nothing to do, except as the narrator and inventor.

Vols. III. and IV. *Godolphin*, and *The Pilgrims of the Rhine*, by the same.

*Godolphin* has been greatly improved by the correcting hand of its now acknowledged author; and the fourth volume of this series is rendered most welcome to us, by the announcement that Sir Edward Bulwer has made an arrangement with the publishers who held copyrights in some of his works, by which he will be enabled to unite them all—"Paul Clifford," "Eugene Aram," "The Last Days of Pompeii," "Pelham," "The Disowned," and "Deveraux"—in this new, handsome, and cheap edition. Whatever success has hitherto attended it will, we are sure, be largely increased by the knowledge of this fact; and we congratulate the public on the means thus offered of possessing so noble an example of what one man's genius (and that man yet young in life) can produce for the delight of readers, and his own and his country's literary renown. The embellishments of these volumes are worthy of Cattermole, Maclise, and Creswick.

#### MISCELLANEOUS.

*Dresses and Decorations of the Middle Ages, from the Seventh to the Seventeenth Centuries.* By Henry Shaw, F.S.A. Imperial 8vo. Part I. London, 1840. Pickering. THIS is, without exception, one of the most beautiful, and at the same time the cheapest, of the publications illustrative of the costume and manners of our forefathers in the middle ages, that has yet appeared. Each number will con-

\* "In some foreign journal I have been much amused by a credulity of this latter description, and seen the various adventures of Mr. Maltravers gravely appropriated to the embellishment of my own quiet life, including the attachment to the original of poor Alice Darvil: who now, by the way, must be at least seventy years of age, with a grandchild nearly as old as myself."

\* "For 'The Disowned' is cast in the time of our grandfathers, and 'The Pilgrims of the Rhine' has nothing to do with actual life, and is not, therefore, to be called a novel."

tain four plates, which are tastefully coloured in imitation of the illuminated manuscripts, or other ancient monuments, from which they are taken, and present charming specimens of ancient art. The text is embellished with a profusion of woodcuts, many of them richly printed in colours, and all conducing to the same object—the pictorial illustration of costume, history, and art. The plates in the first number are a fancy title, taken from a manuscript in the British Museum; a full-length portrait of the celebrated Philip the Good, duke of Burgundy, from a contemporary illuminated manuscript; two beautiful emblematical figures of Old Age and Poverty, from the famous Harleian manuscript of "The Romance of the Rose;" and a fine view of the interior of a room, exhibiting different articles of furniture, &c., from a Dutch painting. The letterpress also is full of interesting information, given in a light and attractive form; and, besides its use to almost every class of literary men and artists, this book of "Dresses and Decorations" will form an admirable ornament to the drawing-room table. We have no doubt that it will have the extensive sale which will be necessary to defray the great expense which must be required to carry on the work in the style which distinguishes the first part.

*Treatise on Sheep and Wool, &c.*, by T. Southey, Wool-broker. 8vo. pp. 118. (London, Smith and Elder; Tegg & Cross.)—Practical advice to the flock-masters of Australia, Tasmania, and Southern Africa, for the improvement of their wool; a staple of great value, in which the pasturage, breed, washing, shearing, &c. &c., are all skillfully treated of. Mr. Southey, however, goes further; and, in our opinion, most judiciously recommends the introduction of the goat, the alpaca, and other lanigerous animals, into these colonies.

*Hope On! Hope Ever! a Tale*, by Mary Howitt. Pp. 220. (London, Tegg.)—A various and instructive little tale, in which both rural and town feelings and manners are illustrated for good moral ends.

## ARTS AND SCIENCES.

### SOCIETY OF ARTS.

THE rewards adjudged by the Society during the present session were on Monday distributed, at the Society's house, by his Royal Highness the Duke of Sussex, President.—The interest of the proceedings was much added to by the presentation of a gold medal to Arthur Aikin, Esq., late Secretary to the Society, "for his long and eminent services, and for his valuable series of illustrations." His Royal Highness, previous to presenting this medal, adverted in the most complimentary manner to the masculine and powerful intellect of Mr. Aikin, to his unbounded scientific knowledge, to the prevailing urbanity of his disposition, and to the unremitted and assiduous manner in which he had performed his duties to the Society for a term exceeding three-and-twenty years. His Royal Highness, in giving the medal, declared that it afforded him the highest satisfaction in contemplating the business of the day, inasmuch as it completed a quarter of a century of his presidency.—Mr. Aikin, after receiving the highest honorary mark of the Society's approbation, returned his thanks for the same in a very grateful and unassuming manner. The Royal President, when eulogising the capacious mind of the ex-Secretary, spoke no more than the truth; and the writer of this article, who has had the happiness of knowing him intimately during the whole course of his connexion with the Institution, can vouch, with many others, to the unlimited generosity of his nature and the systematic kindness of his heart. The rewards were then presented; want of space, as usual, prevents our giving more than those of the greatest interest, viz:—

*In Mechanics and other Practical Arts.*  
To Mr. James Hopkins, Globe Brewery, King's Row, Horseleydown, for his setter for a carriage, five guineas.  
To Mr. William Stidolph, 17 Lower Belgrave Street, Eaton Square, for his frame for teaching the blind to write, the silver Isis medal.  
To Mr. James Reeves, 47 Upper Seymour Street, Somers Town, for his adjustable scaffold, the silver medal and 5s.  
To Mr. J. Hick, jun. Bolton, Lancashire, for his expanding mandrel for turning-lathes, the silver medal.  
To Mr. Robert McEwen, Glasgow, for his double mercurial steam-gauge adapted to the purpose of a safe-valve for steam-engine boilers, the gold Isis medal.  
To Lieut. Hills, R.N. Coast Guard Station, Lancing, for his machine for ascertaining the lee-way of a ship, the silver medal.  
To Mr. J. Sperring, Duke Street, Bloomsbury, for his chair for an observatory, the silver medal and 20s.  
To Mr. Lewis Thompson, 23 Paradise Street, Lambeth Walk, for his new and improved method of assaying gold, twenty guineas.  
To Dr. O'Callaghan, 4th Dragoon Guards, for his apparatus for suspending injured limbs, the silver medal.  
To Mr. Alfred Smee, Bank of England, for his chemico-mechanical galvanic battery, the gold Isis medal.  
To Mr. C. A. Bruce, for discovering the indigenous tea-tracts, and successfully cultivating and preparing tea in the British possessions in India, the gold medal.

*In the Fine Arts.*  
**ANATURKS.—Copies.**  
To Master Thomas Woodbridge, 7 Trinidad Place, Liverpool Road, Islington, for a copy of a horse's head, embossed in copper, the silver Isis medal.  
To Master Grant, 71 Cheapside, for a copy in water-colours of a landscape, the silver Isis medal.  
To Miss Ellen Elen, 43 Robert Street, Regent's Park, for a copy in pencil of sheep, the silver palette.  
To Miss Sarah Barnard, Belvidere Road, Lambeth, for a copy in chalk of a head, the silver palette.

**Originals.**  
To Mr. G. E. Sinterich, 2 St Paul's Churchyard, for a water-colour drawing of horses, the silver medal.  
To Miss Elizabeth Mole, Bury Road, Gosport, for five cameos, the silver medal.

**ARTISTS.—Originals.**  
To Mr. John W. Papworth, 10 Caroline Street, Bedford Square, for a design for a naval monument, the gold Isis medal.

To Mr. Cuthbert Brodrick, 39 George Street, Kingston-upon-Hull, for a sketch of the Percy shrine in Beverley Minster, the silver medal.

To Mr. James Clarke Hook, 37 Chester Place, Kensington Cross, for two portraits in oil, the silver medal.

To Mr. George Wood, 65 Upper Charlotte Street, Fitzroy Square, for a drawing in chalk from a bust, the silver palette.

To Mr. Frederick Lock, 50 Berners Street, for a drawing in chalk from a cast, the silver Isis medal.

To Master John Everett Millais, 23 Alfred Street, Bedford Square, for an historical composition in pencil, the silver Isis medal.

To Mr. Henry Feldwick, 10 Southampton Place, Euston Square, for an engraving on wood, the silver Isis medal.

To Master G. Thomas, 12 Canterbury Row, Kensington, for a composition in sepia of figures, the silver palette.

To Mr. John Parthing Lynn, for a drawing in water-colours of still life, the silver palette.

To Mr. W. Day, 41 Camden Street, Camden Town, for a clay model of a group, the silver medal.

To Mr. Samuel Manning, jun., 17 Newman Street, for a clay model of a group, the silver medal.

His Royal Highness was in excellent spirits. All his good feeling towards the Institution was as much alive as ever; and after having nominated Prince Albert as a member, he quitted the chair, to the great regret of all present, especially to the acting members, that he does not more frequently occupy it.—The Society, as the worthy Secretary observed in his excellent and succinct preamble, not having of late years met with that generous encouragement as heretofore (in consequence of the many institutions which have been set on foot); and consequently not being enabled to deal with candidates with the liberal feeling which has ever characterised their proceedings; it cannot be too powerfully hinted, that nothing would more effectually tend to ensure its success than the occasional visits of its Royal President, whose emphatic words at the last anniversary dinner, when various pecuniary donations were announced, we have not forgotten:—"Come, come, we shall right the old ship at last!!!"

### ROYAL INSTITUTION.

FRIDAY, May 29th.—Mr. Brockedon, 'On some New Application of Caoutchouc.' This

was to the stopping of bottles, decanters, and other vessels, by means of a mould or form of felted wool covered with India rubber. Humboldt mentions in his researches, that the natives of South America use the material for stopping vessels. In that low latitude, the softness and elasticity of caoutchouc always remains; but in the winter of our climate it sets so hard, that, once placed in the bottle, and hardened there, it could not be withdrawn. This appeared to present an insuperable difficulty to the adoption of caoutchouc in England for the same purpose; but ingenuity and perseverance has succeeded in forming a plug of felted wool, and then covering the wool with a thin sheet or film of rubber, the hardening of the rubber never equalled the elasticity of the wool: and thus a light, elastic, and impermeable stopper, perfectly air-tight and durable, has been obtained. Mr. Brockedon gave interest to his relation of the difficulties he had encountered in carrying out his invention, by describing the preparation of the wool felted for his purpose, and in obtaining thin sheets of rubber. The former is now a beautiful manufacture. Threads of wool are bundled together in the form of a long rope, and then pulled until the fibres felt and consolidate to the degree of hardness required. This, for stoppers as a substitute for common corks, is left soft enough to remain cylindrical, and be pressed into the vessel. The stopper is shorter than a cork, and is placed in the bottle with much greater facility than by the present bottling process; for the stopper fitting, with slight pressure, perfectly air-tight, condenses the air in the neck of the bottle, and would spring out again, but that a small wire with a groove in it is first placed in the mouth of the bottle: the stopper is then pressed with the finger down in its place, and the air escapes through the groove in the wire. The wire is then withdrawn, and the stopper kept in its place by the pressure of the atmosphere as well as its adhesion to the neck of the bottle. So perfectly may the air be thus withdrawn, that not a particle shall remain in the bottle, and the mass will appear like a crystal. If the liquid be effervescent, a flat disk of metal is to be wired over the top of the stopper and the bottle. For stopping decanters, the wool rope is felted hard enough to be turned in a lathe into the conical form required: this is covered with the sheet rubber; and this stopper is, upon slight pressure, so air-tight, that the most delicate wines may be kept in perfect condition from day to day whilst a glass remains in the bottle. Some claret-drinkers, who do not drink a bottle a-day, will feel this to be a valuable discovery. Many of these stoppers were shown, and their blackness, set off by the silver mounts, present a handsome appearance. These were manufactured by Mordan and Co., and the article may now, we believe, be bought by all silversmiths in correspondence with that respectable house. Another form of stopper was the overlaying of flat felt with a shell of rubber, and then cutting out circular pieces, which are placed in the metal disks. These are placed upon the mouths of the bottles, not in them, and then wired down. Those in use have been found to answer perfectly for quiet liquors. This form does not require a corkscrew: the stoppers placed in the bottle are withdrawn with a corkscrew, which enters the wool with more ease, and holds more firmly, than in a common cork. Many modes of forming the sheet rubber were described by cutting leaves or veneers from blocks of solid rubber, which had been formed by mastication in an engine

and then pressed into the form of the block. Of these vineers, 18 inches long and 9 wide, eight or nine weigh a pound, and cost five or six shillings; and Mr. Brockedon particularly recommended these for the purpose of covering pickle and preserve jars, as a substitute for the bladder usually employed—a foul and offensive animal matter liable to decay and destroy the things it was intended to preserve: the sheet of rubber, on the contrary, is pure and clean, and may, after washing in warm water, be again and again used. These sheets may be bought of the London Caoutchouc Company, in Lambrook Court, Basinghall Street, or any other manufacturers of India rubber. Other modes of obtaining sheet rubber for covering the stoppers were described, viz. by making solutions with naphtha and other solvents thin enough to cast on metal plates or on glass; and with a thicker solution by rolling out the dissolved rubber into sheets upon cloth previously wetted: when the rubber thus rolled out had sufficiently hardened by the evaporation of the solvent, it could be stripped from the cloth, and when free from any smell left by the solvent, it could be applied to covering the stoppers. It is extraordinary that an article thus manufactured in the wool—manufactured in the rubber, and then combined into the patent air-tight stopper, could be sold at a price per gross less than that of common corks; thus furnishing at less expense an easily applied, perfect, and durable stopper, not liable to decay, decomposition, or fracture, or to be eaten by insects. They are not in the least degree affected by or affect spirits, wine, beer, cider, and common drinks, since neither alcohol nor the vegetable acids have the slightest action upon India rubber. And as they, with slight pressure, close perfectly air-tight, decanters are saved, as well as wine preserved, by their use; for they fit more closely: they do not fix as glass stoppers do in the decanters. Thus we have another application, likely to become an extensive one, of this extraordinary substance, which within the memory of thousands was only known as a material which could be employed to erase the marks of blacklead pencils, is now essential to extensive manufactures of elastic webs and fabrics of waterproof cloths, and of many other important objects, to which its peculiar qualities have been applied.—Mr. Brockedon's lecture was followed by a short notice by Dr. Faraday of the new process of soldering with homogeneous metal by means of the oxyhydrogen blow-pipe, and its value was beautifully shewn in the construction of chemical and other vessels where voltaic action was guarded against by the uniform quality of the metal.

#### ROYAL BOTANIC SOCIETY OF LONDON.

MAY 21.—Hyde Clarke, Esq. F.L.S., in the chair.—After the transaction of the general business, Mr. James Sowerby read a short paper upon the distinguishing characters by which a plant may be known from an animal. Having detailed the constitution of minerals and animals, he remarked that the latter had within themselves the power of secreting the materials required for their growth, of producing the necessary change by respiration, and collecting crude materials in a stomach; that plants require the stimulus of light, and have no stomach; while animals have a nervous system which plants have not. He then stated that there are many organised beings which have motion, and, consequently, a nervous system, but which cannot live without light and have no stomach. These, he pro-

posed, should be placed in a new kingdom between plants and animals, in accordance with a suggestion lately made by Mr. Edwards to the Microscopic Society.

#### ZOOLOGICAL SOCIETY.

VISCOUNT BRAYBROOKE in the chair.—Many fellows were elected. Visitors to the gardens and museum in May, 21,416; receipts during the same month, 598*l.* 6*s.* The decrease by death amongst the Society's monkeys has been in great part, if not altogether, made up by fresh presents and purchases. It appears quite evident that the Society must speedily vacate its premises in Leicester Square, as the building is declared unsafe!

#### INSTITUTE OF BRITISH ARCHITECTS.

AT a meeting held on Monday evening last, T. Kay, Esq. V.P. in the chair, a very interesting collection of drawings of the palace at Whitehall were presented. If not by the hand of Inigo Jones himself, they were made by one of his assistants for the engraved work. It was suggested that the Council should apply to the Duke of Devonshire for permission to inspect his grace's fine collection of drawings by Jones, in order to obtain a knowledge of what drawings by him do exist.—Mr. Fowler called the attention of the meeting to the efforts that were being made to supersede the necessity of employing boys to sweep flues. Much can be done by architects in this respect; for it depends on the construction of the chimney to be cleaned whether or not machinery can be effectively employed.—A communication from Mr. Charles Parker, 'On the London Bed of Clay,' was read by the Secretary. After getting through this clay by boring, sand is arrived at, lying in a chalk basin containing water, on which water depends the supply of Artesian wells formed in the metropolis.—Mr. George Godwin, jun. then read a paper 'On the present State of the Art of Glass-painting in France and England,' wherein he drew attention to the want of encouragement afforded to its professors here; and called loudly on the Government and the Institute to lend their aid in furtherance of this beautiful art. After reviewing the works of the Mengs' school in England, Mr. Godwin pointed out what he considered to be the defects in works of the present time; and expressed a conviction that, to make stained glass appear to be anything else than stained glass was not desirable. An error, as it appeared to the writer, was sometimes committed, in placing copies of the later Italian painters in buildings erected in the earlier pointed style,—it was now universally admitted that all portions of a building should be congruous, wherefore should the windows escape the general law? The writer then gave the history of the glass-painting establishment at Choisy-le-Roi, Paris, where much had been done by Mr. Jones, an Englishman; and terminated with an appeal in favour of the art. The paper excited much conversation, and will probably be of service to the cause it advocated.

#### PARIS LETTER.

Academy of Sciences, June 2, 1840.

SITTING of May 25.—An unpleasant discussion arose at the opening of this day's proceedings, relative to the advisability of immediately, or not, filling up the vacancy occasioned by the death of M. Poisson. M. Gay-Lussac, on behalf of the Section of Physicians, recommended a delay of six months. This was warmly opposed by M. Arago and M. C. Dupin; and the Academy ultimately decided,

by thirty to fifteen, that the election of a new member should take place at once. This incident has caused much party observation in some of the journals.

*Earthquakes in the Pacific Ocean.*—M. Arago, after reading a notice of some experiments by himself on optical interferences and coloured rings, laid before the Academy a letter from M. Dumoulin, 'On Earthquakes and Volcanic Phenomena of the South Seas,' information relating to which had been collected by Captain Dumont d'Urville's present expedition, of which he formed part. The general coincidence of these occurrences with those in South America had been noted or observed. The 7th November, 1837, was the day when the town of Valdivia, on the coast of Chili, was overthrown by an earthquake; and on the same day, at Gambier's Islands, the French missionaries settled there observed a remarkable movement in the sea, of which they took note in their journal. A little before noon the sea rose rapidly; then, at the end of two or three minutes, began to recede, and after having attained the limit of the lowest equinoctial tides again began to rise. Ten such oscillations succeeded each other within four hours, and when the water retired for the tenth time it coincided exactly with the true time of low water. The oscillations were then no more perceived: it was remarked, however, that the coral reefs, which are hardly ever above the level of low-water mark, had been quite uncovered fourteen times that day. The natives of Gambier's Islands had often heard the noises which generally accompany earthquakes, but did not appear to have felt any actual shocks; the oscillations, however, of the sea had been frequently observed. Once the sea had risen thirty feet above high-water mark, and had covered all the low grounds. At Otaheite, and the adjacent islands, it was ascertained that the natives had felt earthquakes, but no precise dates had been noted. "The Sandwich Islands' Magazine," however, recorded some oscillations of the sea on the 8th November, 1837, with shocks of earthquakes, both on that and the preceding day, corresponding to the epoch of the shocks in Chili. The Navigators' Islands, M. Dumoulin observed, were essentially volcanic; the westernmost of the group offering the most recent traces of eruption, though even these are of a remote period. Earthquakes are frequent in the groups, generally from east to west, accompanied by rumbling noises, and causing fissures in the earth. At the Vavas Islands, Mr. Brooks, an English missionary, said he had felt ten shocks in two years, the strongest being on September 15th, 1836. On the 8th November, 1837 (the day mentioned above), the oscillations of the sea were at intervals of ten minutes, and lasted thirty-six hours. In the Viti Islands no accounts had been preserved, but in November 1837 an extraordinary hurricane and high tide had occurred. Earthquakes are common there, and thermal sources are abundant. The Marianne Islands are stated to be subject to earthquakes, but the shocks do not correspond with those of Chili; they coincide with the movements of the Philippine Islands. Few documents, whereby the date of any of these events might be ascertained, were preserved there; but there was a great earthquake in the island of Rota in 1767 which raised the whole island up, and another two years subsequently that restored it to its former level. M. Manuel, Catholic rector of the town of Umata, had observed ten earthquakes during 1838, but only

one of these was a sharp one; while, however, the French ships stayed there, two slight shocks were felt on 1st and 6th of January, 1839. All the instruments were in observation at the time, and nothing indicated any unusual state of the atmosphere: the needle of diurnal variation shook, but only from the commotion of the shock. The volcanic eruptions of Ascension Island (in the Pacific) coincide with those of the Marianne Islands; the subterranean noise preceding the shocks coming always from the north-east, and the fissures, when any are formed, being all perpendicular to that direction. In 1822, 1834, and 1835, the shocks were strong; in 1837 and 1838, they were both rare and weak. In 1825, the sea, after an apparent subsidence, returned with fury to the south-east of the town of Agaña; and, during a perfectly serene state of the atmosphere, suddenly rose eight feet above its usual level. This occurred only at that particular point, although the whole island had shared in the general shock. M. Casilla Salazar, governor of the Marianne Islands, had made the following general observations:—1. The earthquakes were in general frequent in those islands only at the change of the monsoons. 2. The earthquakes were more or less numerous according as the seasons happened to be more or less rainy. 3. The shocks became stronger according as they coincided with any eruption of volcanoes now in activity in the north of those islands. It was further observed, that no recent shocks had been sufficiently strong to overthrow any houses in those islands. The year 1837 had been marked by great disasters in the group of the Carolines. In October, after a violent tempest, the sea overflowed part of the isle of Guam, and did much damage. Four small low isles, namely, Ylato, Satawal, La Monja, and Goulai, disappeared; two of them still have part of their rocks above the surface of the sea; the other two form dangerous shoals. Those of the inhabitants who escaped took refuge in the Marianne Islands. After quitting the archipelago of the Marianne Islands, M. Dumont d'Urville, with the expedition, visited the Moluccas, but found no one there who had made observations of similar phenomena.

*Geology of China.*—M. Stanislas Julien addressed to the Academy some further observations on this topic, extracted from a Chinese author, his communication being limited to the volcanic phenomena of the island of Formosa. The work alluded to has been recently received from China, and is called "An abridged History of the Pacification of the Island of Thai-Wan (Formosa)." It was published in 1723 by Kien-Ting-Youan, who played an important part in the expedition. The sixth book of the supplement contains an article entitled "Fire Mountains," of which the following is an extract:—"That a mountain should emit fire is a fact, which appears fabulous; but that flames should come out of water, is apparently still more fabulous. Nothing, however, is better proved than this double phenomenon. There are two fire mountains in the island of Thai-Wan, within the district of Tchou-lo-Hien. One is to the north of Pan-Tsiouer, to the east of two mountains called Miao-lo-Tchan, and Miao-wou-Tchan. By day, columns of smoke constantly rise from it, and by night it gives out a bright light. It is in that part of the island which is inhabited by savage tribes that cannot be approached. The other volcano forms part of the range which extends to the south of the principal town of the district: it is situated

behind the Ya-Ngan-Tchan mountains." Another passage of the same work relates to a boiling spring emitting flames:—"At the foot of a peak of moderate height, there is to be seen in the rock a fissure by which a boiling stream comes forth. From the midst of stones heaped up in disorder, jets of fire burst forth; and from the bottom of the water, comes a light, brilliant flame, which rises to the height of three or four feet without any smoke. This phenomenon takes place by night as well as by day. If a bit of wood is thrown into this fissure, a cloud of smoke, followed by a bright light, suddenly comes forth, and in the twinkling of an eye the wood is reduced to ashes. The stones are black, and so hard that nobody can break them. The earth surrounding the stones is as much calcined and as hard as they are." M. Julien quoted from the "General Geography," published by order of the Emperor Kian-Long, in 1744, passages relating, some to another burning spring, others to some mud-eruptions; others again, to volcanoes, more or less in activity, and one, in particular, to a solfatara:—"The Sulphur-Mountain (Lieou-Hooang-Tchan) is situated to the north of the district of Tchong-Hoa-Hien, quite close to the town of Tan-Tchoui-Tching (or the City of Freshwater). At the foot of the mountain there is a burning spot which emits a vivid light. When the sun darts its rays upon it, vapours are emitted, which cannot be inhaled without great danger. Earth taken from this part of the mountain is boiled, and a great quantity of sulphur extracted from it."

Notice was given to the Academy of a commercial expedition of three ships, to visit the South Seas and the western coasts of America, partly for purposes of trade, partly for those of scientific observation, to sail from Havre next October. The owners, with great liberality, offered free passage and maintenance for four savans, to be designated by the Institute, and promised to grant them all the facilities in their power. This communication was received with great satisfaction.

The *Académie Française* has awarded a prize of 3000f. to Mlle. Sauvan, for her "Manual for Commercial Primary Schools (Girls);" and a gold medal of 2000f. to M. Hello, for his "Philosophy of the History of France."

*Academy of Inscriptions and Belles Lettres.* Sitting of May 29.—A memoir was read by M. B. Guérard, member of the Academy, on the "Chronicle of Richer," inserted in the collection of Pertz, which threw considerable light on the early history of France.—M. Berton terminated the reading of his memoir on the geography of ancient Tyre.—M. Raoul Rochette read the first part of a report on the discoveries made by M. Manduit in the ancient Troas. It appeared that this gentleman was the first who had shewn that the tumulus, commonly called "The Tomb of Ajax," was of Roman construction, and that there existed the vestiges of a circular tomb, which, in all probability, was the real tomb of that hero. He had not been so successful in designating the tomb of Achilles.

*Royal Academy of Sciences of Turin.* Sitting of May 24.—Professor Gené reported on a memoir by Prince Charles de Musignano, entitled "Amphibia Europæa ad Systema Nostrium Vertebratorum Ordinata."—Professor Giulio read a memoir on the determination of the mean density of the earth, from observations with a pendulum made at the Hospice of Mount Cenis, in 1821.

The *Royal Archaeological Society of Copenhagen*, in sitting of May 17, heard an interest-

ing communication on the discovery of some Runic remains, the foundations of Icelandic houses, a statue of the god Thor, &c., at Bahia, in Brazil, by Dr. Lund, the learned geologist: thus giving additional proof that South America, as well as North America, had been visited by Icelanders and Europeans many ages before Columbus.

The Emperor of Austria has conferred a gold medal on Signor D. Bertolotti, of the Academy of Sciences of Turin, for literary merit.

It may not be generally known that Charles Buonaparte, the father of Napoleon, died at Montpellier in 1783, and was interred there in a very modest tomb in the Church of St. Denis.

A learned and scientific work on the island of Sardinia, with numerous maps, plates, geological sections, &c., in 4 vols. 8vo. by Count Albert de la Marmora, is announced for publication. It has occupied the writer thirty years in compiling.

The angry controversy between Messrs. Arago and Pontécoulant still continues, and assumes every day a more personal character. The latter gentleman has published a letter to M. Encke of Berlin, as a reply to the former's letter to Humboldt. There is a good deal of politics mixed up with this quarrel.

A volume of fables in verse, and minor poems, by M. Bressier, has been given to the world. One of the former, entitled "La Pie," is as follows:—

"Prisonnière depuis deux ans,  
Margot la pie, enfin, trouva la clé des champs,  
Et sans prendre congé s'échappa de sa cage.  
Parmi les oiseaux de retour,  
Elle leur racontait (des captifs c'est l'usage)  
Ce qu'elle avait souffert pendant son esclavage.  
'Où, mes amis,' leur disait-elle un jour,  
'De mes tourmens le plus insupportable  
Était d'entendre le caquet  
De certain oiseau vert appelé perroquet.  
Quel babillard impitoyable!  
Vous connaissez notre voisin l'oisin,  
Criant sans rime ni raison!  
La comédie corneille est assez ennuyeuse;  
Dieu merci l'hirondelle est joliment parieuse;  
Ce n'est rien en comparaison.  
Pour le supplice des oreilles,  
Le perroquet fut fait. Du matin jusqu'au soir  
On l'entend répéter, croyant faire merveilles:  
'Jacot! pauvre Jacot! voilà tout son savoir.'  
Tout maussade qu'il est, sa maîtresse en raffole;  
Elle est aux petits soins pour ce beau favori;  
Elle bat ses enfans, querelle son mari,  
Et caresse l'oisin. Peste soit de la folle!  
Dom Jacot étourdit la maison par ses cris,  
Dame Alix par son bavardage;  
Ils semblent du babil se disputer le prix;  
On n'y tient pas au voisinage.  
Que leurs pareils sont ennuyeux!  
Fuyez-les, mes amis, d'une lieue à la ronde.  
Quant à moi, pour m'éloigner d'eux,  
J'irai, je crois, au bout du monde."  
Chacun méconnaît ses travers:  
Maint grand parleur se plaint des longs discours des autres.  
Nos yeux sur les défauts des voisins sont ouverts,  
Mais ils sont fermés sur des nôtres."

Sciarada.

Primo, Incanto auriga

In me perit.

Secondo, Per me giustitia

Glammi fallit.

Intero, Chi mi soccorre

Dio l'ai benedici.

Answer to the last:—Pa-lino-di-a.

## LITERARY AND LEARNED.

### SOCIETY OF ANTIQUARIES.

MR. HUDSON GURNEY, V.P., in the chair.—The Rev. Mr. Barnwell exhibited an ancient square silver dish, found at Mileham in Norfolk.—Mr. Acton exhibited some dishes, cups, and a vase, or amphora, of mixed white metal, found at Icklingham in Suffolk; one of the dishes was remarkably similar in form and pattern to that found at Mileham, though those from Icklingham appear to be of a much more ancient date. Mr. Gage Rokewode communicated some observations on these relics. Two

Roman coins were found near those discovered at Icklingham, but whether the dishes, &c., were Roman, appeared doubtful.—A letter was read from Mr. Browne, at Vienna, stating that in a book of blazonry, printed at Vienna about 150 years back, he had found the cognisance of the English family of Howard, with the banner of Richard II., apparently from a tomb of one of the family buried at Vienna. On making inquiry after the tomb, he could not at first obtain any intelligence of it; but, after considerable trouble and search, he discovered the stone laid down as pavement, with the face undismayed. It appears that the authorities had ordered the carving to be entirely effaced, before placing it in the pavement, but the workman employed had a praiseworthy reluctance to do so; and, although a policeman was employed to see the defacement performed, he contrived to preserve a considerable part of the carving. With much trouble, and some danger from the authorities, Mr. Browne was enabled to replace the stone by another, and has sent it to Mr. Howard of Corby.—Mr. J. Gough Nichols communicated a paper 'On the Heraldic Devices on the Dresses of Richard II. and his Queen, on their Tomb at Westminster,' drawings of which, by Mr. Hollis, he lately exhibited to the Society. Mr. Nichols noticed the ancient custom of furniture, dress, &c. being marked or "powdered" with heraldic devices, and described the several devices, or cognisances, assumed by different kings and princes of England. Part of this paper being read, the remainder was postponed. The Society then adjourned, on account of Whitsun week, to Thursday, the 18th instant.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.  
*Tuesday*.—Medical and Chirurgical, 8 P.M.; Zoological, 8 P.M.; Society of Arts (Illustration), 8 P.M.; Royal Botanic, 8 P.M.  
*Wednesday*.—Society of Arts, 7 P.M.; Geological, 8 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund, 3 P.M.  
*Friday*.—Astronomical, 8 P.M.; Royal Institution, 8 P.M.  
*Saturday*.—British Architects, 8 P.M.

#### FINE ARTS.

##### ROYAL ACADEMY.

[Fifth notice.]

THE new apartment called "The Octagon Room" is a place which seems better calculated for hiding pictures than for shewing them to the public. And yet it contains works of as high pretension as any that appear in the three great rooms *en suite*. Among them are

5. *The Glee Maiden*. R. S. Lauder.—From "The Fair Maid of Perth." The characters of the monk and of the poor meretricious female are finely contrasted; and the whole subject is treated with Mr. Lauder's usual skill and power.

11. *Titian in his Study*. W. Simson.—The artist has introduced a female figure and a bright mirror, as seen in a well-known picture by Titian himself. The great Venetian is painted *en profile*, and with much care and attention to nature. The colouring is exceedingly harmonious.

Of the few remaining performances which can be seen in this ill-contrived nook, we beg especially to point out 7. *The Ford*, T. Creswick; 12. *Ruins at Cornou—Egypt*, W. Müller; 33. *In the Meadows of Fordwich, Banks of the Stour, near Canterbury*, T. S. Cooper; 35. *Portrait of a Lady*, R. Rothwell; 4. *Portrait of a Lady*, Mrs. W. Carpenter; 31. *On the Scheldt, near Antwerp*, H. Lancaster.

The rooms which the catalogue describes as

for "Drawings and Miniatures," presents the usual admixture of oil-colours. As our limits will not admit of so extended a measure of art, we shall confine ourselves to the legitimate tenants of the apartment; of which there are surely enough to satisfy any reasonable visitor.

Portraiture is still the leading feature; and in that department the works of A. E. Chalon, R.A. claim our first attention. From these we select 563. *Portrait of La Señora de Acuña*; 579. *Portrait of Lady Lytton Bulwer*; 587. *Portrait of Mrs. Richard Lane*; and 624. *Portraits of the Children of Sir John and the Lady Charlotte Guest*; in all of which taste, skill, and variety, are admirably displayed. There are other striking productions in the same walk of art by J. Linnel, J. J. Rochard, W. F. Wainwright, and J. W. Wright.

520. *The Colleen-bawn and the Colleen-dhu, Peasants*, S. Lover, is a very clever drawing; marked by some peculiarly characteristic features. It is a sweet Irish subject, and treated with true national feeling.

575. *Sketch for a Picture of a Battle of the Amazons and Grecians*. G. Jones, R.A.—As a composition, it does credit to the talents of the artist: as a subject, it does no credit to either of the parties engaged.

584. *The Disabled Commodore in his Retirement at Greenwich Hospital, 1800*. Sir D. Wilkie, R.A.—Such subjects are no less worthy of the pencil of painters, than of the noble provision made for our brave veterans of both navy and army.

580. *An Indianman "taken a-back" in a White Squall in the Bay of Bengal*. W. J. Leatham.—In how many colours squalls may appear we know not; but we know that this representation of one of them is skilfully and spiritedly executed.

598. *Fossil Fishes, from the Collection of Sir Philip Egerton, M.P.* J. Dinkel.—Very curious and very beautiful specimens, imitated in all their details with the greatest care and skill.

619 and 629. *In the grounds of Marble Hall Cottage, Twickenham*. J. J. Chalon, A.—The banks of the Thames, where its embellished retreats afford the most beautiful examples of the picturesque, could scarcely yield any more interesting than the subjects of these detached representations.

623. *Israelites: a Study*. S. A. Hart, R.A. Elect.—The characters here brought together in composition, independent of any excitement from subject or event, are of a very high order.

In Landscape, the room is not wanting in rich variety; and when we say that several of these productions are from the pencil of so distinguished an artist as J. Martin, it will sufficiently guarantee their merit. But we are now called upon briefly to advert to the Miniatures and Enamels. Some of the former are of more than the ordinary size, and of more than ordinary merit. Among the most distinguished are the productions of W. C. Ross, R. Thorburn, W. Booth, Sir W. J. Newton, A. Robertson, Miss Gilles, S. Lover, H. Collen, &c. The enamels occupy, as they deserve, a conspicuous place in the room. Among them:—893. *Charles I., from the Original by Vandyck*; and 902. *Henrietta Maria, Queen of Charles I., from the Original by Vandyck*, H. P. Bone (whole-length portraits), are distinguished by the fidelity and finish with which they are executed. Others, by W. Essex, J. Haslem, W. Bone, jun., J. Lee, &c., are also entitled to great praise.

We must not omit two drawings which add attraction and variety to the rest of the room,

viz. 869. *Charles Kemble, Esq.*; and 870. *Charles Kemble, Esq. as Don Felix*. R. J. Lane, A.E.

[To be continued.]

#### NEW PUBLICATIONS.

*Portrait of Mrs. Maberly*. Painted by F. Grant, S.A.; Engraved by T. Landseer. M'Lean.

THE Queen's example has brought horsemanship into fashion, and has thereby conferred the greatest benefit on the fairer portion of her majesty's loving subjects. This is an equestrian portrait of the highly-gifted authoress of the new novel entitled "Emily." Beautiful herself, she manages her spirited steed beautifully, and sits with as much nonchalance, during one of his capering caracoles, as if she were the rough rider of a regiment of cavalry. The names of the artists are a sufficient warrant for the animation and excellence of the work.

*The Plunder of Basing House*. Painted by C. Landseer, A.R.A.; Engraved by J. G. Murray. Mrs. Parkes, Golden Square.

WHEN the picture from which the noble print now under our notice has been engraved appeared at the last Exhibition of the Royal Academy, at Somerset House in 1836, we spoke of it with unqualified commendation; characterising it as one of the finest compositions we had ever seen, and as a work in which, warmly as we had always expressed ourselves with respect to Mr. Charles Landseer's merits, that able artist had gone far beyond our expectations, and had taken new and very high ground indeed. It is with great pleasure that we feel ourselves justified in extending our praise to this most successful transcript of the original. We may here observe that mezzotinto engraving has been gradually gaining ground since the time when the late John Dixon introduced a mixed manner into his prints; of which style "The Tyger," after Stubbs, and "Ugolino," after Sir Joshua Reynolds, were brilliant examples. Of late years, however, the art has made a more than usually rapid progress; and in the present day mezzotinto, in addition to the qualities which it already possessed, has been rendered as luminous as any other mode of engraving. Of all these modern improvements Mr. Murray has happily availed himself. He has done more. He has faithfully preserved the varied expression, and the pathos of the painting. We have before us, in undiminished power, the fierce and sanguinary ruffians who are the perpetrators of the outrage; the venerable nobleman who is the victim of his loyalty, and of his devotion to his ancient faith; and his lovely and affectionate daughter, who is endeavouring to cheer and support him under the dreadful circumstances of the moment; while the costumes, the armour, the plate, the jewels, the parchments, and the other accessories of the scene, are represented with all the truth and attention to detail by which they were distinguished in the picture. The late Mr. Payne Knight was sceptical on the subject of the moral influence of the fine arts; and held that their civilising and softening effect was at any rate confined to their lovers and professors. We are of a different opinion, and are persuaded that such a production as that to which we have just called the attention of our readers must excite in all who see it a salutary horror of violence and bloodshed, and a warm sympathy for suffering dignity and virtue.

*Illustrations of British Costume, from the Earliest to the Present Period.* Drawn and Etched by Leopold and Charles Martin. Part I.

THE commencement of a publication which, when completed, will, we have no doubt, be very interesting and valuable, both to the artist and to the antiquary.

*Letters of Illustrious Personages of Great Britain, in Perfect Facsimile.* Collected and Copied by Joseph Netherelift. Nos. I and II. M<sup>rs</sup> Lean.

THESE letters are intended "as self-exhibitions of the various characters in the series of British Portraits, with biographical and historical memoirs, by the late Edmund Lodge, Esq. F.S.A." Some of them are exceedingly curious, and will interest the general reader not less than the historian and antiquary. Mr. Netherelift's talents in this branch of lithography are well known. The letters in the two numbers before us are from Margaret of Lancaster, Henry VIII., Anne Boleyn, Edward VI., Lord Darnley, the Earl of Murray, James I., Charles I., Charles II., Cardinal Wolsey, Archbishop Warham, Sir Thomas More, Cardinal Beaufort, Crommer, Cardinal Pole, Mary, queen of Scots, the fourth Duke of Norfolk, Prince Henry, son of James I., Oliver Cromwell, and Prince Rupert.

*Mr. Henry Betty, in the Character of Rolla.* Drawn by F. Onwhyn. Onwhyn.

WHOEVER recollects the theatrical wonder of between thirty and forty years ago, may trace in the print under our notice a similar expression of countenance, although (a father will pardon the remark) with more finely formed features.

*Robert Burns. Painted by C. Hancock; Engraved by W. Gilles. Moon.*

SCOTIA'S bard is here represented "with his hand on the plough, and his heart with the Muse." He is intently gazing on that

"Wee, modest, crimson-tipped flow'r,"

which formed the subject of one of his simplest and most pathetic effusions; and, by the pensive expression of his countenance, he appears to be anticipating the period when he

"Maun crush among the stoure  
Its slender stem."

In the meanwhile his "naigs" are making the most of their hour of relaxation from labour, and constitute an excellent back-ground for the figure of the abstracted poet.

#### THE FRENCH SCHOOL OF ART.

*The Louvre: Salon of 1840.*

[Sixth Notice.]

WE have now noticed nearly all the classes of painters of the modern French School, as exemplified by their works in this year's *salon*, except the painters of interiors, of architectural subjects, &c., the painters of landscapes, and the painters in water-colours. In the interiors, we have little or nothing of particular excellence to mention, except a good view of the "Church of St. Sebastian," in Spain, by M. Sebron, the gentleman whose able brush painted all M. Daguerre's later dioramas; and a very clever sketch of "The Bedroom of Louis XIV. at Versailles," by Lafay. Whoever has visited that gorgeous apartment will recollect the richness of colour for which it is remarkable; and the artist, who is generally successful in subjects of this kind, has acquitted himself with unusual vigour, both of conception and of handling, in representing the "grand mo-

narque," with some of his courtiers and Mansart, his favourite architect, discussing the merits of a plan.—There is a French artist of great powers, who is now studying at Venice, whither he has betaken himself as an imitator of Canaletti—M. Joyant; and he ever and anon sends over to Paris canvases of the greatest beauty. This artist, though at present he is keeping too strictly in the leading-strings of Canaletti—so much so as scarcely to attempt anything for which he cannot find an authority among the works of that master—will no doubt come out in course of time as a painter of vast power and originality. For breadth of shadow, and for truth of local colouring, we do not hesitate to say that he is equal to Canaletti in his best times; but in aerial effect, and, if there be any poetry in architectural painting, in the imaginative parts of his pictures, he is superior. A large view of the Place of St. Mark, from the western end, and several smaller pieces of Venetian views, have attracted well-deserved attention in this year's Exhibition. What M. Joyant wants is the warmth and masterly conception of our own Roberts; but it is not given to many men to come near that great painter in their works.—M. Justin Ouvrié is another of the most rising architectural painters in France; and this year he has given us a "View of a Court at Fontainebleau," that indicates talent of a very high order.

But let us come to the landscape-painters, Nature's own imitators and interpreters,—they who should be not merely the delineators, but also the poetical translators, of all that she has of fair or beautiful, of terrible or sublime;—men whose hands should be such servants to their eyes, and their eyes to their souls, that the facts and deeds of the material universe should be conveyed by them to all men in legible and harmonious characters. The landscape-painter is one of that order of Nature's priests whose duty it is to represent, as it is of others to proclaim, the order and excellence of the Creator's works; and in this exercise of his function she is required to use the same warmth of feeling, the same ardour of imagination, the same desire to bring out and put forward all that is brightest and best in what he beholds, as the poet is, whose sphere of descriptive action is limited to words, and the extent of whose delineative powers is determined by the white paper and the flowing pen. It has been justly remarked, that the painter of inanimate objects should not attempt to give them merely as they are; that is, as they strike his own individual perception; but that there should be a certain selection of the good and a suppression of the bad parts, which may be sure of producing an agreeable effect upon the minds of his fellow-men,—that is to say, of his judges. So much of the beauty of any assemblage of objects, or of its ungracefulness, depends upon the frame of mind of the observer, that the reason of this precept is readily perceptible; and sanctioned, as it has been, by the almost uniform practice of all the greatest masters, it may now be laid down as a fundamental canon of art. The fact is, that the vulgar and uninformed mind is rarely so much touched by the mute language of the creation, the real "harmony of the spheres," as it ought to be: it is dull in perceiving the analogies, and in feeling the associations of ideas to which a cultivated mind is all alive, when the eyes are feeding on some exquisite specimen of the Almighty's handiwork: the eye holds no communion with the soul, and the ideas that are impressed become easily effaceable from the barren tablets of the memory. It is not the

peasant who feels the beauty of the spot on which he lives: it is the man who is a reader, a thinker, a searcher after what is good and great, who knows how not only to admire the glorious works of the Parent of Good, but also to praise the beneficent hand that has placed him amidst them. As with men, so it is with rude or partially civilised nations; the love for landscape-painting is one of the latest tastes that spring up amongst them; and it is a branch of art that is only beginning to develop itself when the others have reached a state of maturity. "Of all modes of painting," says M. Delécluze, a French critic of great acumen, "that of landscape seems to be the one that most requires experience of art, and long and laborious observation of nature. Nearly all the famous landscape-painters, Claude-Lorraine and Poussin among others, only betook themselves to their styles at a late period, and attained to excellence in them only after long study of nature, and when their well-practised hands had overcome all difficulties of practical execution. Landscape-painting, in the course of a painter's works, holds nearly the same place as descriptive verses and moral descriptions do in those of a poet: in each case they are the results of maturity of age,—of the autumn of life: landscape-painting is the last mode that is thought of being adopted; and it may be said that, in general, the descriptive style in literature, like landscape-painting in art, are only appreciated, and therefore only cultivated, at certain epochs of civilisation, when disgust for men and things leads back the mind to simple ideas, and the grand, calm pictures of nature."

This is at once beautiful and true: our object in quoting it, and in making the foregoing observations, is to introduce the remark that the French artists are now beginning to feel the real poetry of landscape-painting, and to form a school based on corresponding principles. They are, as a class of landscape-painters, inferior, far inferior, to our own countrymen; but still they have great men among them, and not many years will elapse before great things will be done by them. At the head of this school stand Decamps and Dupré, followed by their pupils, or imitators, Cabat, Troyon, Jeanron, Marillat, Legentile, Flers, Corot, Flandin, &c.; while in separate lines, clearly defined by the variety of their practice, we may place the great names of Isabey and Gudin. As we have once before had occasion to observe, the system of colouring adopted by these artists is one of no small complication, and of great power. They commence by painting on their grounds as if they were preparing for the most transparent, sketchy picture that ever left the easel of an English artist; and Gudin, indeed, proceeds very much upon the English system, finishing his picture, however, at the second coating, and evidently working with all his colours in a very wet state. Isabey finishes in probably the third painting over; so does Flers; and both of them preserve high degrees of transparency, the second more perhaps than the first,—there being, at the same time, an immense distance between them in point of ability. Decamps paints repeatedly over his pictures,—five, six, seven times in parts, but with great rapidity; preserving, after all, a pseudo-transparent effect, which, when harmonised by his glazings, which he uses with the utmost science, produce an incredible richness and solidity of tone that, perhaps, he alone possesses. The fault of his method is that his colours have not time to dry one under the other, and they chip and crack. Dupré, on the other hand, is as slow as any of the others are

rapid: he professes to take Ruysdael for his model, and, commencing with a bold, hot, hard-painted ground, he works and works upon this, painting bold glazing, and then painting again on the glaze, and then glazing again upon that, and then giving force with some fresh touches, till, at the end of a year or two, his canvass comes out a perfect gem. If the paintings of this master could be examined with a microscope, they would present a curiously reticulated surface, through the interstices of which each of his coats of paint, down to the primitive groundwork, might often be traced. He boasts, and justly, that his colours are indestructible, so solidly and toughly are they worked up and bound together. Troyon, the favourite pupil of Dupré, adopts his manner altogether, but with rather more boldness and with much less patience. M. Cabat, a pupil of Flers, proceeded like M. Legentile (who, by the way, is a young artist of extraordinary promise) also upon M. Dupré's plan: he has, however, latterly entirely given himself up to the study of Poussin, in composition, colouring, handling, idea—in fact, every thing; but, though an implicit imitator, he produces great and original paintings. We ought to say that Isabey, who is very fond of painting the interiors of alchemist's laboratories, and subjects of that kind, combines solidity of painting with rapidity of execution in a manner for which he is without a rival; and the surfaces which he succeeds in giving to his paintings have that peculiar richness and boldness which colours, when applied as Sir Joshua Reynolds said they ought to be, of a creamy or cheese-like consistency, will generally leave on the canvass. The names which we have here mentioned are decidedly the greatest of the French landscape school of the present day. At the head, in our own opinion, stands Decamps; next to him, Isabey and Dupré; then Cabat, Troyon, Flers, &c. Gudin stands apart; he is the Turner of France: he is not like any body else, and nobody is like him; nobody imitates him, and for this plain reason—they cannot: there is no one that can come near him for rapidity, and there are none that have the same vein of poetry.

Roqueplan and Lepoitteirin are two eminent men in the landscape line; while the former is great as a semi-historical painter and as a delineator of rich interiors; the latter being, as we have already had occasion to shew, "a dab hand at a boat," and "a whale at the sea," to borrow some elegant expressions from Brother Jonathan. As a painter of sea-pieces, Gudin is certainly the first in France, and as certainly next to him is Isabey; but, to go on with the limners of dry land, we must mention the three chiefs of the opaque school, Coignet, Lapito, and Giroux. We need not explain their practice, having already defined it to exist fundamentally in the principle of each colour remaining good just as it is stuck on: but we may add that each of these artists, and many of their pupils, are such capital draughtsmen, and have been such good students of nature, that their pictures are always pleasing; their main defect being, as may be easily anticipated, crudity of colour. There are five young marine and coast-scene painters in France of great promise,—Mozin, Morel-Fatio, Delacroix, Dubois, and Stubbs (the latter a young Englishman of Boulogne), who, if they persevere, will bring the school into no small repute. The latter goes much on the English transparent principle, and is rapidly advancing into note every day; the first of the four has plenty of the stuff whereof painters are made to cut himself out a lasting reputation: indeed they are all good.

In the present *salon*, Decamps and Dupré have no canvasses whatever; Isabey has one; Gudin, seven; Jeanron, two; Cabat, four; Troyon, four; Marilhat, Lepoitteirin, &c., several; Roqueplan, none:—the display is chequered; it is not, on the whole, first-rate; but there are enough pictures to necessitate a few words upon them. Of all the landscapes, those by M. Cabat are the most remarkable; his *magnum opus* being a study, à la Poussin, of a rich woodland scene, somewhere in Italy (though, from the subject, "The Good Samaritan," it ought to be in Judea), a sloping, rocky ascent, with stately trees, among which winds a road; the sea in the distance; the time, incipient twilight: the sun just gone down, and the moon up, and yet not night, as Byron so beautifully describes it. It is a picture of great solemnity; the vertical lines of the stems of the tall trees cutting the horizontal lines of the sea and a rocky ridge; the slope of the hill, introducing a general system of diagonal lines, with the road winding across that slope, giving another system of lines, intersecting and sloping in an opposite direction; the calm stillness of all nature, where not a leaf of the trees moves, and the quiet repose of the sea, repeated in a clear pool of the foreground; the blue expanses of the water, the cloudless heaven, the dark green of the foliage, and the rich tones of the rocks;—all this produces a grand and harmonious effect, peculiarly satisfying to the eye and the mind; and the visitor of the Louvre stops at once, and remains long before a work of such first-rate excellence. Another landscape, "The Lake of Nemi," by M. Cabat, is a poetical, but still a faithful, view of that favoured spot: the artist has nothing but a magnificent tree inclining over the pool, with a rude boat in the foreground; but his treatment of the tree and the water is masterly in the extreme—all is grand and tranquil.

#### ORIGINAL POETRY.

##### THE SLAVE-TRADE.

AN illustrious meeting at Exeter Hall, on Monday, has followed up the course pointed out for the final extinction of this horrible traffic in a manner which must delight every humane heart. Having contributed our humble effort to the good work in the *Literary Gazette* of March 21st (No. 1209), on reviewing Mr. Buxton's volume, we shall not trench on the usual newspaper province by any report or remarks, but content ourselves with adding a poetical contribution to the holy cause:—

##### MORNA; OR, THE SLAVE.

An Eclogue, respectfully addressed to the Society for the Extinction of Slavery in Africa.

Scene.—The Banks of the River Zahir.

ALONG the beach, by Avarice beguil'd,  
A ruthless mother dragg'd her only child;  
What time the rising sun, with genial beam,  
Had shed its radiance o'er the passing stream;—  
Their prey awaiting, where in ambush stood  
Europe's unfeeling sons who trade in blood.

Yet ere the harden'd crew the purchase paid,  
And to their grasp her daughter she conveyed,  
With faltering voice, and palpitating breast,  
Her cruel parent Morna thus address'd:—

"O Thou! from whom the breath of life I drew,  
List to my plaints,—the base resolve subdue.  
Why am I thus, unconscious of a crime,  
In virgin innocence and beauty's prime,  
Endow'd with many a grace of heart and mind,  
To cruel hordes and Slavery thus consign'd?  
Doom'd in some foreign clime to endless toll,  
And dead alike a tyrant's frown or smile!"

Bethink thee, ere base lucre steel thy heart,  
What numerous joys these tolling hands impart:  
Do they not turn the soil from morn till eve,  
That ripen'd grain thy hunger might relieve?  
Cull from the palm or date the choicest fruit,  
To please thy palate, or thy fancy suit?

Have they not oft, when labour closed the day,  
Made to my art the fiery race a prey?  
The dashing oar with ceaseless ardour plied,  
And sped thy bark through Zahir's silver tide?  
And when rude winds our hut were wont to rend,  
Fell torrents pour and driving rains descend,—  
When the fork'd lightning gleam'd athwart the sky,  
And Osi's dreadful voice was heard on high,—  
Have I not slain the tiger on the waste,  
And with his skin thy trembling limbs embraced?  
Reflect on this. And when the noontide heat  
Parch'd every shrub, and wither'd every sweet,—  
When tall palm-trees sicken'd on the plain,  
And sturdy hinds, exhausted, fell with pain,—  
To groves of orange or banana's shade,  
Have I not oft thy feverish form conveyed?  
And amid odorous steeps and plantain bowers,  
Beguiled with artless lays the sultry hours?

Deeds but to name should Avarice control,  
And melt to tenderness the sternest soul.

Say, mother, say: should sickness ill disclose,  
Who like thy child will lull thee to repose?  
Plunge in the forest drear to get thee food,  
Or scour the waste, or skim the foaming flood?  
Thy sorrows who partake—thy misery feel,  
And here a balm and there a charm reveal?  
And, doom'd that child to slavery and shame,  
To writhe beneath the lash her tender frame,  
Extremes of hardship and of pain to bear,  
Or sink, perhaps, the victim of Despair?  
Thinkst thou the gold these harden'd hands display  
Will chase Compunction or Remorse away?  
No! Grief will follow and thy peace invade,  
In nightly dreams—my visionary shade.

But should these tears, this reasoning, fail to move  
One ray of pity—of maternal love:  
If from my looks, my cares, my youth, my sighs,  
No fond affections, no compassion rise;  
Or the remembrance e'en of labour past,—  
Hear this appeal, and it shall be my last.  
When spurn'd by kindred, and by friends forgot,  
Pain, penury, and woe, beset thy lot;  
And, groaning 'neath the weight of age austere,  
Death with his train terrific shall appear:  
When of all pleasing hopes, all rest beguil'd  
(Shouldst thou for some dull lucre sell thy child),  
Whether thy dying pangs thy throes will ease,  
And keen remorse, more fell than death, appease?  
Oh! trust me, sinking to the silent grave,  
None for thy parting soul will blessings crave!  
But thou wilt mingle with thy native dust,  
By all despised, neglected, and accurs'd."

The maiden paused: her looks, her tears, were vain,  
A cruel mother's purpose to restrain:  
Unmoved she saw degrading cords invest  
Her polish'd limbs—entwine her throbbing breast,  
Half frantic to the bark beheld her borne  
To Congo's shores—ah! never to return.

JOHN BELFLOUR.

#### THE DRAMA.

*Italian Opera.*—*Ines de Castro*, a pleasing opera of the modern school, though rather of the slow and heavy class, has been brought out at Her Majesty's Theatre, and, without originality, deserves the applause it obtained. Several of its compositions gratified the ear; and the performance of the whole was excellent. Taglioni has also appeared to enrapture the admirers of the dance; and the omnibus box, so late the focus of furious row, is now a concentration of such enthusiasm, that stalls and pit catch the infection, and the whole audience rings with shouts and clappings, such as no pair of feet ever earned before.

*Covent Garden.*—On Friday last week this theatre closed, and Madame Vestris delivered a very pertinent address. The season, with all its advantages, has done little more than save its spirited management from loss; but in properties, and other expenses incident to a theatre, it must have made provision against similar heavy outlay next year. Two new plays by Sheridan Knowles and Leigh Hunt have been the only dramatic efforts of importance, though perhaps in these days the Christmas pantomime and the clever Easter piece might venture to compete with Love and Poetry. The striking feature of the season has been the costliness and care with which the stage has been garnished. The scenery, by the Grieves, has been replete with many beauties; and the costumes, under the direction of Mr. Planché, have mingled antiquarian skill with an application of dramatic effect in a manner more perfect than

has hitherto been generally seen. On the whole, the theatre has been so liberally and well conducted that we are glad to find it remains in the same hands; and we trust, with the experience gained and the means (to which we have alluded) amassed, Madame Vestris will reopen with ample public support, and carry through a profitable season, giving more encouragement to the dramatic genius of the day, and producing more novelties worthy of popularity than she has in her first essay with a great house been able to accomplish. At present, it is enough to say of her, that she has done more than any political government ever did,—fulfilled all her engagements; and, more than most of our young folks do, dressed well and paid her way.

*Haymarket.*—Having elsewhere offered a few cursory remarks on the tragedy of *Glencoe*, we have here only to notice the manner in which it is performed. As usual, the genius of Macready raises the part of *Halbert* to a towering height above all the rest. Sententious in the didactic, and overwhelming in the passionate scenes, he resembles that unrivalled spot whence the play is named; varying at every turn, beautiful, wild, impressive, and terrific, and natural in every change and aspect. Inimical critics say that modern plays are monodramas written for this performer; it is true in no other sense except that his admirable personations make them so. We should rejoice to see ten other Richmonds in the field; but, as there are none, we are not disposed to find fault with One, whose own abilities place every character he undertakes at the top of the profession, and almost out of sight of competition. We like Miss Helen Faucit much in *Helen*. There is a subdued tone and a sweet maidenly feeling about her performance of the character, which are very touching. Mr. Howe's *Henry*, we are sorry to say, spoils much of the poet's language and effect. This is aggravated by the anomalous dress, which, though correct, has an evil influence on the stage pathetic. The *Ramillies* military mixture suits wretchedly with the free and graceful Highland garb; and the union tended to throw an air of ridicule over the scenes in which *Henry* appeared. We wondered how the killed *Halbert* could be enraged by, or the gentle *Helen* be in love with, an object so accoutred. Miss P. Horton did the little which the interesting *Alister* has to do with her usual talent, and in the slight part displayed both the spirit and the feeling with which it is sketched. Mrs. Warner, also, did all that could be done by looks and energy, for the character of *Lady Macdonald*; and Webster's *Mac Ian*, together with the other less prominent parts, were efficient personations, contributing their full share to the general effect.

On Monday, Mr. Kean made his appearance in *Hamlet*, on his return from America, and was warmly received by a crowded house. Of the performance we have only to say, that his *Hamlet* is not our *Hamlet*: it was, nevertheless, much applauded, and in some of its worst parts. Who shall direct taste, of all things else, in the drama? Another attraction at this theatre, independent of *Glencoe* thrice a-week, has been Buckstone, who is about to start for America; so that with coming from, and going to, the United States, there is never a want of London Stars.

*Prince's Theatre.*—Weber's *Euryanthe* has been produced here with considerable effect. Without the finish of the Italian stage, there is a certain strength in the German which makes

amends in earnestness for the want of polish. If sufficiently encouraged, so as to lead to the engagement of the highest combined talent, this branch of music might, we think, be naturalised and liberally rewarded in London.

*Downton's Benefit* on Monday presents such a cast of characters in the comedy, musical interlude, and farce, as were hardly ever assembled on any one occasion. It will not only, therefore, be an act of grateful kindness to swell the receipts, but an act of great self-indulgence in every lover of the drama. Many may see there the lights of days gone by, whom they can never see again; and in future years will be able to recall with happy memory the night when they witnessed so brilliant a congregation of histrionic talent, engaged in goodwill and harmony in so meritorious a performance.

*Mr. Eliason's Concert, Monday Evening.*—So many musical entertainments, public and private, given on the same evenings, of necessity divide the disposable talent and dim the lustre of a single assemblage; and, moreover, the double engagements of the singers, &c. consequent thereon derange the order of succession which the programme promises. Notwithstanding such impediments, Mr. Eliason's concert was complete in every attraction; and overflowed with many beauties, vocal and instrumental, some of which we proceed to notice. Auber's "O Tourment du Veuve!" was sung by Madame Dorus-Gras most sweetly. The delicious warbling of this accomplished singer, and the sweet flexible voice of Madame Stockhausen, contributed largely to the harmony of the evening, and to the enjoyment of the lovers of sweet sounds. We must, however, except an injudicious selection by the latter: the song from the Seasons (Haydn) is not suited for that voice, so charming in German and Swiss ballads. Mercadante's "Liete yoci" was sung by Signor Tamburini most superbly. The other singers were Misses Hawes, Birch, Mlle. Bildstein, Madame Schumann, Mr. H. Phillips, Mr. John Parry, and Herr Schmetzer: also the "German Chorus" conducted by Herr Ganz. These latter exerted *herrselves* very effectively, and with delightful harmony. The instrumentalists were Liszt, Eliason, Schultz, and Jarrett (piano, violin, guitar, and horn). The mere mention of their names is sufficient guarantee for the excellence of their several performances. Liszt's "Grand Valse di Bravura," in the second part of the evening's selections, was enthusiastically encored. The call was responded to by a substitute, which equally displayed the powers of the celebrated pianist. This, however, is forestalling, as we cannot conclude our notice without a few remarks on the finale of the first part: Beethoven's "Grand Sonato for Pianoforte and Violin," dedicated to Kreutzer, and played by Liszt and Eliason. They strove in rivalry, not each to exhibit his own skill, but both to give effect to the beauties of the great composer. The subdued notes of the piano accompaniment gave increased brilliancy to the tones of the violin; and nothing could excel the combined effort.

*Societa Armonica.*—The programme of Monday night was, doubtless, the most attractive of the season; and the concert consequently gave the greatest satisfaction to a numerous audience. The everlasting trio of Correlli for two violoncellos and double bass, which is so beautiful that it cannot be played too often, was, even without Dragonetti, charmingly performed. Mr. Howell's double bass is next to Signor Dragonetti's, which is

high praise. A fine overture by Berlioz, which we hope to hear again, abounding in striking and novel passages, was one of the great hits of the evening. Mr. Haumann's violin fantasia was played in masterly style, and warmly encored; indeed, the whole of the instrumental music was of the highest order, and did credit to the director or directors of these excellent concerts.

#### VARIETIES.

*Surrey Zoological Gardens*, as a place of evening resort and entertainment, have entirely superseded the bygone Vauxhall. On Monday they were crowded, and the spectacles of the volcanous Hecla, the frozen sea, and other phenomena, were truly astonishing. It is not possible to conceive the effects of these magnificent exhibitions without ocular demonstration; and both young and old will be amply gratified by a visit to the Surrey Zoological Gardens. The grounds alone are well worth inspection, and the many animals in the highest order complete the manifold attractions of this spot where instruction and amusement are so profusely blended.

*Cambridge Camden Society.*—Our readers will be glad to hear that the long-projected restoration of the Tower of St. Benedict's is at length to be carried into execution. The parish having kindly given their leave, the renovating of this curious specimen of Saxon masonry will immediately commence. The tower will be pointed in ash mortar, which will at the same time be a better protection from the weather, and will restore its original appearance. The west door, which is a barbarous wooden erection, will be removed, and one of stone, more suited to the character of the building, will be inserted.—*Cambridge Chronicle*.

*Charing Cross.*—In excavating the ground for the Nelson Column, a mass of ancient matters have been discovered, including the trunk of a tree, bones and horns of various kinds, and other deposits, which seem to indicate the site of an old market, when London stood a good many feet under its present level.

*Francis Bacon, Esq.*—We have this week to record the premature death of this gentleman, well known to the literary world as one of the editors of "The Times" newspaper. Endowed with great abilities, exercised in a journal of extraordinary influence, and consequently exposed to no slight temptations in every possible form, Mr. Bacon was a warm-hearted and manly character, resolute in his opinions, yet friendly and considerate, both in the public and private relations of life. Mr. Bacon, about a year ago, married a daughter of Horace Twiss, Esq., and has left an infant daughter unconscious of her heavy loss. Among the number of those who knew and highly esteemed him, we are sincere mourners of this melancholy event.

*Outlines of China* (by Robert Bell, Esq., author of the "History of Russia," &c.)—These tracts, of only ninety-two pages, reprinted from the "Atlas" newspaper, are peculiarly worthy of public acceptance at this period. Mr. Bell has, with great industry and discrimination, put together all that the general readers might desire to be informed of respecting the past, present, and future, of our enemy the Celestial Empire.

*Academy of Toulouse.* Sitting of May 2d, 1840.—M. Morliarian read an interesting memoir on the progressive extinction of feudal slavery and villanage in France during the middle ages. He attributed the primary causes of it to the crusades and the formation of the

corporation of towns, taking the same view in this instance as Simondi and Hallam have done.—*From our Paris Correspondent.*

#### Academy of Moral and Political Sciences.

At a recent sitting a long memoir was read from Professor Galluppi of Naples, 'On Transcendental Idealism and Absolute Rationalism.' The learned author reviewed the systems of Locke, Hume, Kant, &c., and declared himself strongly against German Rationalism. The memoir was referred to a committee, who are to draw up a report on it.—*Ibid.*

#### Lines Epitaphial.

Oh! grief is very sad and thirsty work;  
Let's take our bottle, since we've lost our Cork.

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

An Encyclopedia of Rural Sports, by D. P. Blaine, 1 vol. 8vo. 50s.—Introduction to the Modern Classification of Insects, by J. O. Westwood, 2 vols. 8vo. with about 5000 Figures, 2s. 7s.—History of England, by Sir J. Mackintosh, W. Wallace, and R. Bell, 10 vols. fcap. 3s.—The Rev. Sidney Smith's Works, 2d edition, with Portrait, 3 vols. 8vo. 36s.—Travels in Germany and Russia, by Adolphus Slade, Esq. 8vo. 12s.—Judgment in Error, in the Case of Stockdale v. Hansard, fcap. 4s.—Rev. W. Jenkyn's Exposition of St. Jude, revised by the Rev. J. Sherman, royal 8vo. 10s. 6d.—Narrative of an Expedition to the Polar Sea, 1820 to 23, by T. von Wrangell, edited by Major Sabine, 8vo. 18s.—Instructions in Gardening for Ladies, by Mrs. Loudon, fcap. 6s.—Gulliver's Travels, illustrated edition, royal 8vo. 4s.—A Summer in Brittany, by T. A. Trollope, 2 vols. 8vo. 32s.—Principles of Political Economy, by W. Atkinson, 8vo. 8s.—Butler's Analogy, by the Rev. E. Bushby, 8vo. 6s.—Rank's Ecclesiastical and Political History of the Popes of Rome, translated by S. Austin, 3 vols. 8vo. 36s.—Sir S. Romilly's Memoirs, 2d edition, 3 vols. 8vo. 30s.—Burnet's Pastoral Care, new edition, by the Rev. T. Dale, 12mo. 4s.—The Great Law of Consideration, by Dr. Horneck, 18mo. 7s.—Practical Enquiry into the Philosophy of Education, by J. Gale, 12mo. 4s.—Walker's Pronouncing Dictionary, by Smart, Epitomised, 7s. 6d.—Principles and Practice; or, Stories for Young People, 18mo. 2s. 6d.—Biblical Cabinet, Vol. XXVI.: Wemy's Clavis Symbolica, 12mo. 7s. 6d.—Letters on Socialism, by the Rev. T. Best, fcap. 4s. 6d.—Walks at Templecombe, by Louisa Muckleton, square. 3s. 6d.—The Surveyor's and Builder's Perpetual Price-Book, by W. Bushell, oblong. 12s.—Fairholme on the Mosaic Deluge, 4d edition, 8vo. 16s.—Supplement to Ker's Nursery Rhymes, 12mo. 6s.—A New and General Notation for Life Contingencies, by P. Hardy, 8vo. 3s.—Alfred Crowquill's Guide to Watering-Places, post 8vo. 3s. 6d.—Practical Observations on Abortion, by J. S. Streeter, 8vo. 4s.—British Preserves, by S. Howitt, 4to. 25s.—Sermons Preached at Valparaiso, by J. Rowlandson, 12mo. 7s.—The Churchman's Manual of Baptism, by C. E. Kennaway, 12mo. 3s. 6d.—Rev. L. Gussen (of Geneva) on the Prophet Daniel, 12mo. 5s.—Vital Dynamics: Hunterian Oration, 1840, by J. H. Green, 8vo. 6s. 6d.—Practical Treatise on Accouchees, by J. P. Cory, 8vo. 8s.—The Grammar of Botany, by G. Francis, 12mo. 4s.—The Pattern of Prayer, by David Duncan, 18mo. 1s. 6d.—Church and State: a Poem, by Clivia, 12mo. 4s.—The Harpapp Jubilee, by Mrs. B. C. Hall, square, 5s.—Peter Parley's Book of Gymnastics, square, 2s. 6d.

Wind, south-west from the 28th ult. to the 1st inst.; since, north-west and west.

Except the 2d, generally clear: a little rain fell on the morning of the 29th ult.; lightning and loud thunder, accompanied with heavy rain, from about eight to nine o'clock in the morning, and from about noon to one in the afternoon, of the 2d.

Rain fallen, .19 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

Desirous of affording as much of our space as we could to the review of M. von Wrangell's interesting work on the North Polar Regions, we have to apologise for the delay of several other literary matters prepared for this week's Number. We trust the best excuse will be found in the extracts from the volume to which we refer.

Not having had a card from Miss Dorrell and Miss Bruce's concert, we can take no notice of the letter on the subject from our esteemed correspondent.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

### BRITISH INSTITUTION,

PALL MALL.

The Gallery, with a Selection of Pictures by Ancient Masters of the Italian, Spanish, Flemish, Dutch, and English Schools, including One Room of the Works of the late William Hilton, Esq. R.A. Keeper of the Royal Academy, will be opened on Monday next, the 8th instant, and continue open daily, from Ten in the Morning until Six in the Evening.

Admission, 1s.

WILLIAM BARNARD, Keeper.

### LAW OF MARRIAGE.—At a

Meeting of parties assembled by the existing restrictions upon Marriage, held at the Office of Messrs. Crowder and Maynard, No. 3 Mansion-House Place, London, on Thursday, the 21st of May, a Committee, consisting of seven of the gentlemen present, was appointed (with power to add to their number), to take the necessary steps for obtaining a repeal of the objectionable restrictions upon Marriage, and more particularly that which prohibits marriage with a deceased Wife's Sister; and it was resolved, that the objects of the meeting should be forthwith published in such of the London and Provincial papers as the Committee might think proper, with a view to obtain the active co-operation of all parties interested.—Communications to be addressed to Messrs. Crowder and Maynard, as above.

### ORIGINAL DRAWINGS BY MARTIN,

PARRIS, and the late W. DANIELL, R.A. To be Sold, at very low Prices, upwards of 150 Drawings by the above eminent Artists. These Drawings being small sizes, are peculiarly adapted for Cabinets, and as a present of the objects.

On view at Churton's Library, 26 Holles Street.

### PHILOLOGICAL SCHOOL.—Patroness,

the Queen. Founded in 1792, the Education of the Sons of Clergymen, Naval and Military Officers, Professors, Men, Clerks in Public Offices, the higher order of Tradesmen, and other persons of an equally respectable class of society in reduced circumstances. The Annual Examination of the Boys of this school will be held on Thursday, the 18th instant, at the Lecture Theatre, 17 Edwards Street, Portman Square, when the chair will be taken by the Right Hon. the Lord Portman, at One o'Clock precisely.

EDWIN ABBOTT, Secretary.

### AVIS AUX PERSONNES qui SAVENT

le FRANCAIS.—Bouhais's French Newspaper, "LE COURRIER DE L'EUROPE, ECHO DU CONTINENT," a French Newspaper, published in London every Saturday, commencing June the 6th, and containing 46 columns, in the form and size of the "Examiner." Price 6d. stamped for post.

This Journal will be devoted to the following subjects:—1. All interesting facts relating to France and the Continent.—2. The official portion of "Le Moniteur Français," and the best articles of all the French Newspapers, Reviewers, &c.—3. The celebrated Feuilles de Jules Janin.—4. The "Courrier de Paris" of Viscount Delanoue.—5. The most interesting trials, &c., from the "Gazette des Tribunaux"—6. Every Article, as it appears in the French Journals, by Victor Hugo, Lamartine, De Balzac, &c.; as also Extracts of all New Works of Interest, published in Paris.—7. The Proceedings of the French Chambers; ditto of the Academy of Sciences.—8. The Paris Fashions.—9. English and Colonial Intelligence.—10. Original Articles, political and literary, by M. Victor, formerly Editor of the "Courrier de l'Europe," formerly Prefect of Le Chateau, and Editor of the "Figaro" (of Paris), which he rendered by his talents the most popular and successful journal in France.

The "Courrier de l'Europe" will thus combine in one all the Newspapers of France; giving the substance of "Le Journal des Debats," "Le Constitutionnel," "La Presse," "Le Nécrolog," "Le Charivari," "La Revue de Paris," &c.; while the fifty-two numbers published in the year will form an enormous volume, presenting a complete view of all that the most renowned French writers have published.

Orders and Advertisements received by A. Seguin, Librarian, 18 Regent Street; Joseph Thomas, Newspaper and Advertising Agent, 1 Finch Lane, Cornhill; and all Booksellers and Newsmen. N.B. Frenchmen, and persons conversant with the French language, in America, the Indies, and throughout the world, will fully appreciate the value of such a journal as the "Courrier de l'Europe."

Price Half-a-Guinea.

### THE ILLUMINATED ATLAS OF SCRIP-

TURE GEOGRAPHY; a Series of Maps, delineating the Physical and Historical Features in the Geography of Palestine and the adjacent Countries, accompanied with an Explanatory Notice of each Map, and a Copious Index of the Names of Places.

By W. HUGHES, F.R.G.S.

"This is a beautiful and most valuable work. Of the numerous branches into which the science of geography is divided, that which has reference to history, and sacred history more especially, is decidedly the most interesting. \* \* \* Altogether the work forms an indispensable companion to Mr. Knight's beautiful 'Historical Bible' and 'History of Palestine.'—*United Service Gazette*, May 25.

"It ought to be in every school-room and study; for a most instructive volume in the most valuable of all knowledge, that of the Sacred Scriptures, it will be found to be. We can improve the aged for their comfort, and our much-worn eyes happily make us very competent judges on the subject, that, by a novel method of printing, the physical features of the countries represented, their hills and valleys, their lakes and streams, are clearly delineated, without in the least interfering with the exhibition of the names of the places. Most of us have often had to regret that, in the most prominently relieved maps, where the mountain-ranges have been most distinct, the places have been almost hidden. In this Atlas this defect is obviated, by reversing all former plans and printing the mountain lines in white instead of black. The effect is very pleasing."—*Continental Journal*, May 25.

"Works on the geography of the countries mentioned in Scripture abound; but the best published previously to the appearance of the present Atlas, was that by Mr. Knight, which, though in general, was more complete, in which the mistakes of a higher order of maps are perpetuated and new faults superadded."—*Court Gazette*, May 25.

London: Charles Knight and Co. 25 Ludgate Street.

**HYDRO-OXYGEN MICROSCOPE.** A very superior Instrument of this description, constructed by Carey, for the researches of an eminent Physician and Physiologist, to be disposed of on Moderate Terms. May be seen, and Particulars obtained, on application at 181 Strand.

By L. MACLEAN, Esq. F.R.S.  
Author of "Historical Account of Lions," "Sketches of St. Kilda," &c. &c.  
"It contains many truths which are astounding, and at which the ignorant may sneer; but that will not take from their accuracy."—*Sir Wm. Betham's Letter to the Editor*.  
Smith, Elder, and Co. 65 Cornhill.

## THE FIRST NUMBER OF

**THE INDIAN NEWS,**  
AND CHRONICLE OF EASTERN AFFAIRS;

A Monthly Newspaper, containing Sixteen Pages small folio, price 1s. will appear immediately after the arrival of the next Overland Mail, expected about the 10th of June.

This Publication is intended to supply a demand which is now anxiously made, not only by parties connected with India, but by the whole community, for early, regular, and authentic information on Indian affairs. Each Number will serve to diffuse almost instantaneously the information received by the mails, which has hitherto appeared either in isolated portions in the general Newspapers, or in certain Magazines, some weeks later. The intelligence will be classified under the heads Political and Domestic, the former illustrated by Original Articles, and the latter comprehending every thing that can possess even the slightest interest for the relations and connexions of the Colonists. The Contributors engaged, whose sole object is the advancement of British interests in India, China, and the whole Eastern World, are practical and experienced men, and their efforts will be carried on under the direction of an Editor of acknowledged competence.

THE INDIAN NEWS will for the present appear every month, price 1s.; or 10s. for the First Twelve Numbers, if paid in advance. More frequent publications may hereafter be found necessary, of which due notice will be given. Communications for the Editor to be sent, free, to MESSRS. SMITH, ELDER, and Co. 65 Cornhill. Orders for the Paper may be addressed as above, or to any Newsvender or Postmaster in Town or Country.

8 New Burlington Street, June 6.  
**MR. BENTLEY** has just published the following NEW WORKS:—

I.  
**Stephen Dugard; a Novel.**  
3 vols.  
"Stephen Dugard" is a powerful novel, written by a person of very considerable thought and ability."—*Spectator*.

II.  
**Memoirs of Sir Sidney Smith, K.C.B. &c.**  
By the Author of "Rattle the Reeler."  
2 vols. 8vo. with Two Portraits of Sir Sidney Smith, the first engraved after Opie, and the second (taken at a subsequent period) after Sir Robert Ker Porter.

III.  
**Three Years' Residence in Canada (1837-1839).**  
By T. R. Frostson.  
Late of the Government Service at Toronto.  
3 vols. post 8vo.  
"Authentic information upon the real state of Canada is highly acceptable, and Mr. Frostson's work supplies much curious and illustrative matter, gathered by an eye-witness of the civil war. The volumes are very entertaining."—*Atlas*.

IV.  
**The Path-Finder; or, the Inland Sea.**  
By J. Fenimore Cooper, Esq.  
Author of "The Prairie," "The Pioneers," &c. 3 vols.  
"A beautiful and interesting story, bearing on it that stamp of reality which genius only can impress."—*Courier*.

Nisbet and Co. Berners Street; Churchill, Princes Street, Sals; and at the Institution.

**SPORTING IN IRELAND AND SCOTLAND.**

In 3 vols. post 8vo. with numerous Illustrations, price 16s. bound, **THE SPORTSMAN IN IRELAND and the HIGHLANDS of SCOTLAND.**

By A. COSMOPOLE.  
"A most well-informed, humorous, and agreeable travelling companion. The leading features are all, more or less, of a sporting nature, and in this point of view the work has uncommon interest. The details the author gives of his various 'expeditions' in the beautiful lands which he passed over, cannot fail to send hearts of sportsmen thither who never before contemplated such a visit, and many more who would scarcely have ventured such an undertaking without the guide here placed at their disposal. The work is embellished with very many spirited and interesting sketches of remarkable localities, and is altogether one of the most readable and amusing books of its kind that we have had for many a day."—*New Monthly*.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

**LETTERS from the OLD WORLD.**

In 2 vols. 18mo. cloth, 12s.  
By A LADY of NEW YORK.  
Being Descriptions of Travels in Egypt, Syria, Palestine, Asia Minor, Turkey, and Greece.  
Also, just received,

**The Knickerbocker, or New Monthly Magazine** for April, containing Articles by Washington Irving, Miss Mary Anne Browne, Mrs. L. H. Sigourney, Mrs. Mary Clavers, and others. 2s. 6d.

**The United States Magazine and Democratic Review** for March, containing the following articles:—*Current Reform, Democracy, Bacon's Rebellion, Louis Napoleon Bismarck, Italian Opera*, &c. 2s. 6d.  
Wiley and Putnam, 35 Paternoster Row, London.

### REVIEWS OF NEW BOOKS.

*The Stage, both Before and Behind the Curtain.*  
By Alfred Bunn, late Lessee of the Theatres  
Royal Drury Lane and Covent Garden, &c.  
3 vols. 12mo. London, 1840. Bentley.

WE have only seen a portion of this work, and will not, therefore, offer any opinion upon it. We may just notice that there is plenty of personality; and that the views, both connected with the stage and the individuals who are victimised, are such as were to be expected from the relations which the writer has borne towards them. The prologue is a sketch of himself; and before we allude to what he thinks of others, we may as well shew what he thinks of himself.

"In reply (says he) to the 'great deal that has been said about, and indeed against, Mr. Bunn since he has become a London manager,' Mr. Bunn takes the liberty of speaking at last for himself. Vituperation is the fate of all public men, and one who has been so much and so long before the public as myself, must or ought to have been prepared for a given *quantum*—it is the more than *sufficit* that I find fault with. I have been aimed at by too many shafts to escape, and, though brought down at last, the marksmen will find they have 'scotched, not killed' their prey. The tremendous quantity of down-right falsehoods that have been put into circulation respecting so humble an individual have induced many people to believe, until they saw the animal, that it must be one with two snouts, and at least half-a-dozen tails. I have endeavoured to console myself at times with the bit of comfort the French poet has prescribed, when he says—

'Quand on perdu tous ses ennemis,  
On a perdu tous ses charmes!'

and to feel convinced that unless I possessed some extraordinary qualifications, I should never have provoked such extraordinary hostility. I have, however, felt the one without finding out the other."

From so modest an estimate of self, we pass to Mr. Bunn's estimate of the profession over which he has so notoriously presided for several years:—

"Her majesty's dominions do not contain a funnier set of people than actors, a great portion of whom are styled, by courtesy, her majesty's servants. Their avocation, to be sure, is drollery, and if it were confined to its proper place—the stage—we should have no cause of complaint; but that is the very last place where they seek to be amusing. If a man who has dealings with them will but call into his aid a sufficient degree of philosophy (of course he will stand in need of more than an ordinary quantity), he will find them the most diverting set of creatures in existence; and when he has exhausted all the patience at his command, he will find them something else. Taken as a body, and standing apart, as they do, from the rest of the community, they must be judged by rules of their own creation to be understood; but if examined upon the principles that regulate society at large, they are altogether unintelligible. They are the most obsequious, and yet the most independent set of people upon earth; their very vitality is based upon 'the weakest of all weakness—vanity;' almost every

sentiment put in their mouths is at variance with every action of their lives—their whole existence is an anomaly. The feverish state of excitement upon which their fortunes depend is a perpetual drawback to any exercise of the judgment they are supposed to possess. Their occupations bring them for ever before a tribunal whose opinion, being decisive for the moment, induces them to mistake temporary approbation for permanent respect, without once referring to circumstances. They virtually serve two masters—their employer behind the curtain, and the spectator before it; but upon the established principle of not being in reality able to serve both at one time, they select, in all cases of emergency, the one they deem the most powerful—*vox populi* is with them *vox Dei*. That mysterious line of light across the stage (yclept in theatrical phraseology the float) through whose rays such a false colouring is for the most part given, appears to them to establish a stronghold of their own, which may set at defiance any other upon earth. The framer of our language must have had a performer in his eye when he compiled the word—*SELF!* for performers never think of any thing else. Compliant beyond measure when seeking engagements, insolent in the extreme when they have once obtained them, and in the exercise of the duties belonging to them, they verify the line of Churchill at every turn,

'There is no tyrant like a player-king.'

The dramatic literature of the country, for any neglect of which a manager is at all times unceremoniously belaboured, lies entirely at their mercy—the feelings of an author are solely dependent upon their disposition—the welfare of the theatre they are bound to be balanced upon their pleasure. In all this self is the mighty ruler—self, the predominant feature. An actor, who from his peculiar position has the power, will sometimes bind down his employer by an article of engagement, that renders the very opening of the doors almost a personal favour on his part. If you fulfil such article, you injure the profession at large, and every other member of it; if you do not, you injure him—at all events in his own opinion. Clamorous as a hungry dog until you place him favourably and perpetually before the public, the moment you do so, he complains of being overworked. Examine well an actor standing at the wings previous to his going on the stage, and then the moment he is on it; examine him on his own quarter-deck, the green-room, and then examine him in the Freemasons' Hall, at his annual fund dinner, and you will need no further comment. He will upbraid in unmeasured terms, for some imaginary undervaluation of his sublime qualities, the very people before whom he is found in five minutes afterwards bowing with profound humility; and he will turn up his nose behind the scenes at a gentleman whom over the festive board he will most respectfully solicit for a contribution to his favourite, his only charity!"

As we mean nothing more in this notice than to amuse our readers with the first taste of a book upon a subject of general curiosity—

the Stage—we shall conclude with Mr. Bunn's account of the *Garrick Club*, only mentioning that, as he was excluded from being a member of it, his statements must be received with a good deal of salt:—

"The Club, thus christened, deserves particular notice in these pages, from the conviction the writer has always been impressed with, and has invariably stated, of its being one of the most detrimental institutions to the best interests of the drama, and the well-doing of the two patent theatres, that ever was established. It was formed towards the end of the year 1831, for purposes very different from those it at present in my opinion carries out, and as such is entitled to especial comment. The original object of its founders was, no doubt, to bring into closer connexion the player and the patron, for the advancement of the one, and the amusement of the other. It will probably be maintained, with an immense flourish of rhodomontade, that its higher aim was to uphold the stage by every legitimate means, to countenance the respectable portion of its professors, to advance the general welfare of the principal theatres, and to give a becoming impetus to the dramatic literature of the country. Let us inquire how this ought to be done, and how it has been done. To carry so laudable an object into effect, such club should be composed of leading men of *ton*, of property, of learning, of science, and of taste—of a few of the very few performers of talent to which the stage can now lay claim, and as many as possible of the most distinguished members of other professions, whose genius could shed its influence and protection over

'The youngest of the sister arts,  
Where all their beauty blends!'

I am willing to admit that, by the rare assemblage, by the lucky union of so many of the great and good, much permanent advantage might be brought about. The very reverse, however, I consider to be the case, both as regards the constitution of the Club, and its consequences. The grand desideratum of all such societies—that of keeping them select—has in the first place been totally lost sight of, and several of its noble and early patrons have, it is said, consequently seceded. The familiarities practised by 'some players whom I have seen play,' the professional slang in which they are so apt to indulge, and the eternal tax they are upon all who associate with them, have mainly contributed to this result. The Garrick Club, thus shorn of its proper supporters, has degenerated into a sort of Junior Law Club. At its tables congregate some of the *soi-disant* critics of the day, who gather together what little dramatic intelligence they deal in, from the gabble, and very frequently from the hoaxing, of some waggish by-standers; and whose notions of any particular actor's performance are derived from what they have heard that particular self-satisfied actor say of himself. The natural tendency of the mind to censure, faint praise, or deep damnation, is here indulged in to the heart's content; very likely not with any ill intention, but with the impression the dealers in it labour under, that they are 'nothing if not critical.' There are

one or two supposed Solons in such matters, who bring an account, to the nightly gadders herein assembled, of the presumed receipts for that evening of every theatre in the metropolis—who would be miserable if they could not state them, and more so if their statements were not believed. Not a domestic calamity amongst the many to which theatrical life is subject, but it is known here the moment it happens, and is discussed with mysterious avidity. The daily object of its visitors is to listen to the *cancans* of the green-room, instead of upholding the productions of the stage; to retail the jokes of some author over the bottle, instead of giving them the benefit of 'loud laughter' in the scenes they belong to; and to lure brother members to the fascinations of the dinner-table, instead of tempting them to the enjoyment of a private box. It would perplex a wiser man than many of the learned pundits belonging to this Society, to name one single benefit, by way of set-off to all this mischief, which it has ever conferred on the drama of the country, or on the two principal temples dedicated to it. There is, to be sure, an annual dinner on the 23d of April, to commemorate him who needs no commemoration; rendered famous by the extraneous contribution of a self-important critic to the pocket of a self-important dramatist, both supposed to be Shaksperian spirits. But what good does this do to the drama, its professors, and the theatres royal Drury Lane and Covent Garden? Is there, on an average, a shilling a-day that makes its escape out of the pockets of all the members put together into the treasuries of these two theatres? Most of them are free of one or other of the houses, and those who are not, find no difficulty in becoming so for the once. Do they award any premium to literary talent that can stimulate the efforts of struggling genius? 'Devil a ha'put!' as one of their Irish members is occasionally apt to exclaim. What good, then, does this association confer to counterbalance all the mischief which it, in my opinion, leads to? Why it affords a great many worthy people, who prefer not giving their address, an opportunity of dating and receiving letters that have all the appearance of coming from, and going to, a very important place. It moreover affords many a malcontent the peculiar advantage of coals and candles gratis, the reading of newspapers and periodicals, foreign and domestic; the use of pens, ink, and paper; together with the cookery of a chop and the necessary appendages of plate and linen, at a far cheaper rate than human ingenuity could possibly accomplish it at home. It serves as an emporium, where the traffickers in small talk may be sure of finding a customer. All this may be exceedingly pleasant, but has no connexion whatever with the advancement of the drama; on the contrary, it leads to its degradation, from the fact of such scenes, all very apposite in most other clubs, taking place in one assuming to itself, and rejoicing in, the historic appellation of 'The Garrick.'

*Travels in Germany and Russia; including a Steam Voyage by the Danube and the Euxine from Vienna to Constantinople, in 1838-9.* By Adolphus Slade, Esq. R.N., author of "Records of Travels in the East," &c. &c. 8vo. pp. 512. London, 1840. Longman and Co.

THE author has not traversed new ground, but being a person of sense and observation, moving among those from whom good intelligence is likely to be obtained, his volume is an agreeable addition to our stock of data respecting Russia,

the Porte, Egypt, Austria, and the various movements and prospects in which they are concerned with the rest of the world. It is not, however, our province to enter into these relations; and all we shall say of Mr. Slade's political views is, that he gives great credit to the King of Hanover for his measures since his accession to the throne, and is very jealous of the encroachments of Russia in every quarter of the globe. Of the first he remarks:—

"The taxes have been reduced since King Ernest's accession, and the general prosperity of the country has increased. The king has made overtures to his chambers to conciliate the constitutions of 'nineteen' and 'thirty-three'—to adopt a medium between them—and it is to be hoped, for the sake of the country, that they will be accepted."

The following extracts refer to the last:—

"When the Emperor Nicholas visited New Russia in 1837, he prolonged his journey to Ghelindjik on the coast of Abasia, where General Williamoff's army was encamped, and there seeing with his own eyes the cruel consequences, in the sufferings of his soldiers, and the impolicy of the war of extermination which had been projected against the Abasians, to which his attention had also been drawn by an able memoir of M. Scassi to Count Nesselrode, he ordered a discontinuance of it, and a recurrence to milder measures. Measures thenceforward against the Circassians were, I have understood, to be confined principally to a strict blockade, to corruption, and to endeavours to introduce commerce among them from the various military posts, according to the conciliatory system, which was beginning to be successful when the war-party in the cabinet of St. Petersburg overruled it, as being unworthy of the majesty of Russia. That party, at the head of which was Prince Menzikof, elated by the peace of Adrianople, boasted that they would, in six months, carry fire and sword into every fastness of Circassia. But several years of failure and heavy loss have undeceived them; while the enormities of some of the Russian officers, particularly of a General Zass, who commanded a movable corps on the Kuban, have united the Circassians firmly together. General Zass's excesses have done great injury to the Russian cause. The following trait related of him is novel:—He caused a Circassian chief who had fallen into his hands, to be bound to a tree under which a mine of powder was laid. The prisoner's followers, seeing no Russians on the spot, came in the night to release him, when the train was fired, and all—prisoners, friends, and tree—were blown up. I regret to say, that I heard some Russians at Odessa term this a clever feat, instead of stigmatising it as a barbarous act; becoming a red Indian, perhaps, but rather unworthy of a Russian officer. The blockade of Abasia is twofold: by a line of forts extending along the course of the Kuban from the highroad between Mosdoc and Tiflis to the sea; and by another line along the coast commanding all the accessible points. There is, besides, an army ready to take advantage of circumstances, commanded, since the death of General Williamoff in 1838, by General Rievsky, who got out of disgrace in 1837 by a memoir on the mode of reducing the Abasians."

In anticipation of establishing a mighty dominion on the monopoly of commerce between Europe and Asia, Russia has secured, or is securing, all the routes leading to Asia, east of Caucasus. She is already mistress of the water-line: the mouths of the Danube, the Euxine, the Don,

the Wolga, and the Caspian, are hers; and she has only to take up the splendid design of Selim II. (of Turkey), of cutting a navigable canal from the Don to the Wolga, a distance of about thirty miles, in order that merchandise may be carried by water from beyond Vienna to the heart of Persia, and the confines of Khiva. I will not speculate on the chance of uniting (or reuniting?) the Oxus with the Caspian, by which Afghanistan would be nearly approached by water, since that may not be practicable. From the Euxine, three routes conduct eastward into Asia: first, by the Don and the Wolga to Astrakhan, on the Caspian; this was a favourite route of the Venetians; secondly, by Redout-Kaleh, on the coast of Abasia, through Immeretia to Tiflis; whence the distance is short to Bakou, on the Caspian, twenty-four hours' sail from the rich silk province of Ghylan, in Persia. There is a road fit for carts between Redout-Kaleh and Bakou; this route was followed by the Genoese; thirdly, by Trebizonde and Erzerroom into Persia: this route has been followed of late years, in consequence of the Russian government having closed the port of Redout-Kaleh, with the view of blockading the Abasians more closely, and is chiefly used by English and other merchants trading with Persia: it is in the Turkish territory; but Russia, in order to command it, is building a first-rate fortress at Goomri, about nine miles from the road, and forty miles from the Turkish city of Kars. Goomri will also be a *point d'appui* in any future operations against Asia Minor. In a similar spirit of prevision, Russia has, I hear, built a fortress at the extremity of the gulf Tiouk Kharassou (on the Caspian), about fourteen days' march from Khiva. Russia has nearly levelled the natural obstacles to the revival of the ancient transit between the East and the West, and has opened land and water communication for merchants; she is preparing to offer her subjects and the Germans an opening for a vast commerce with Central Asia, and even with China, without the necessity of traversing the ocean; and the agency of steam will give facilities for extending their operations to a degree un contemplated in other days. It appears a dream to think that we may in a few years be able to steam through the heart of Europe, from Ratisbonne to the farther shores of the Caspian, without setting foot on shore; thence in a few days reach the Oxus; navigate that river to Kondouz, which is at no great distance from Cabool; and, re-embarking on the Cabool river, continue on by water to the Indus, where a thousand miles of navigation present themselves, from the neighbourhood of the Rhine to Lahore, without seeing the ocean, or using land conveyance for above twenty days! Will commerce follow this new track, in compliance with the axiom, 'the port makes the trade?' Will the Central Asiatics avail themselves of the communications opened for them with Europe? Will they accept, through the agency of Russia, the products of civilisation which we have neglected to convey to them by the Indus and their own streams? I think we may answer in the affirmative, and prepare ourselves to witness, before many years, the commencement of a third commercial revolution since the Christian era. Russia, I fear, will profit by our indifference to the importance of civilising Central Asia by commerce,—by our neglect of the facilities which have so obviously presented themselves to our notice. Above one hundred years Russia has been fighting her way eastward—occasionally checked, but never repulsed; step by step she has overcome the obstacles

which impeded the flow of commerce from the West into Central Asia. What have we been about during that time? What have we done for the prosperity of the countries lying between the Indus and the Caspian?

"Russia endeavours to persuade Europe to join with her in destroying the growing Musulman anti-Russian power of Mehemet Ali, and to unite in supporting the decaying, faction-torn government of the Ottoman Porte, which cannot by itself, she imagines, escape from her toils. Her cool effrontery, in expecting Europe to do this, is unparalleled in the history of politics: and if any power in Europe should favour her in this respect, the act will be without a parallel in the annals of condescension."

Of the internal condition of Russia we shall select two examples; and first of Brigandage:—

"Brigandage, in the provinces of Russia, is also a more important and professionlike affair than is usually supposed. Numerous bands keep together for years without being dispersed. Their motto being '*guerre aux riches, paix aux pauvres*,' the peasants harbour them as friends, and often give them timely notice of police movements. A formidable banditti, three or four hundred strong, was perambulating the governments of Smolensk and Orël while I was at Odessa, headed by one Trishcof, a man of fun and capacity, as would appear by the following trait, which reached us by private letters. Such things, it may be observed, never find their way into the public journals, if such a one as I saw at Odessa deserved the name, and which was only remarkable for sedulously extracting from the French papers any remarks which there might be in them against England. Trishcof was a Captain Rock in his tactics: his plan was to send to a wealthy individual and desire him to have a sum of money ready at a given hour, or ———. His requests had been complied with in several instances; but a certain proprietor whom he thus distinguished in January 1839, by a hint to have 20,000 roubles ready on the following evening, when Trishcof would send for them, determined to refuse compliance. After a few hours of anxious deliberation, he came to the resolution of sending to the nearest military station for assistance. The next morning he was delighted at seeing a detachment of infantry approach his house. He received them with open arms, and treated the party most hospitably, expressing his sense of the promptitude with which the general commandant had complied with his request. Such a paternal government! After a good breakfast, the officer of the party requested the proprietor to inform him of his case, and to point out in what way he could best serve him, as his orders were to abide by his directions. The proprietor replied that, as he had informed the general, Trishcof was coming that evening for 20,000 roubles, and he wished the officer to dispose his men, so that the brigand might be surprised. The officer asked if the money was ready. 'Yes,' was the answer. 'In that case you have no occasion to wait till evening,' continued the officer, smiling and throwing open his coat: 'I am Trishcof, and will take the money now.' This trait of the brigand's address created much amusement at Moscow, at the expense of the 'country gentleman.' Notorious brigands, when captured, are severely knouted, and, if they survive, sent to the mines in Siberia."

At Odessa the country is described as one "where the eighth commandment appears to be deprived of the negative particle;" and Mr. S. continues:—

"This is an assertion of so grave a nature, that I would not have ventured to make it had I not had abundant ocular proof of its correctness, amply confirmed, moreover, by the testimony of every body, rich and poor, natives and foreigners, at Odessa. The propensity amounts to a national disease. It is easily explained. The (artificial) nobility of the country are poor and extravagant; they must make by their situations, or, in plain English, rob the public. Long habit has made their minds easy on the subject, and their inferiors have naturally taken the tone from their masters. The robbery at Odessa, while I was there, was not only very remarkable, but highly ludicrous, from the absolute want of respect for any persons or things. As is always the case, where a whole community is exposed to the same evil, the theft of the night was the joke of the next morning. Nothing was safe. Sacks of wheat were carried away from the magazines in carts; rouleaus of notes were stolen from counting-houses; baskets of linen were abstracted from bed-rooms; garden palings were pulled down for firewood; larders were emptied of their contents; thermometers were removed from windows; and even children were stolen. If you dined in a strange house, you were not surprised to find your cloak missing from the hall. These were not isolated cases: they were of daily and nightly occurrence. The servants made no scruple of robbing their masters, and were not discharged; simply because, in all probability, others of the same description would have replaced them. In one of the wealthiest establishments at Odessa, where I dined once or twice, the lady of the house, when the company went to the dining-room, used to lock the saloon, in order that nothing might be purloined while they were at dinner. What appears extraordinary is, that no sense of shame is excited, even in respectable persons, by a suspicion of doing that which in another country could not enter the imagination. Madame ———, at Odessa, one day received a morning visit from Prince ———. After his highness had taken leave, she missed a jewelled watch from the table. She suspected her visitor of having taken it away; and on his coming again, in a day or two, taxed him with the (in our estimation) felony. The prince was surprised at the charge, but in no way scandalised. He protested his innocence. The intercourse continued as before, although the lady continued of her first opinion till the watch was found three months afterwards on a labourer, who confessed having stolen it. Two things strike an Englishman as remarkable in this transaction: first, that a lady could suspect a gentleman of stealing, and tell him so; secondly, that a gentleman could have such a suspicion entertained of him and feel comfortable. It is a proof, among many others, of the depth of demoralisation in some portions of Russia."

We shall now pick out a few stray anecdotes, &c. to close this notice.

"The princess, wife of the Archduke Charles, was by all accounts a charming person: her husband thought so also, notwithstanding her love of expense, so much at variance with the economical notions of the Hapsburg family. The Emperor Francis loved her with all a father's love. At her death the clergy objected to place her body in the imperial vaults because she had died a Protestant. 'Away with you!' cried the heart-stricken emperor; 'she lived with us in life, and shall be with us in death.' This sentiment shewed

him worthy of a better crown than the 'iron crown.' The following anecdote is of a lighter character, but equally shews the opinion entertained of the man. After his death, the model of a statue of him was placed for a few weeks, in order to judge of the effect, in the middle of the road leading from the palace to the adjoining gate of the city. It obliged carriages to make a slight circuit. In allusion to this, a writing was affixed to the statue making the departed emperor say: 'My friends, why have you placed me here, obstructing the road? You know I never, in life, stood in the way of my subjects.' \* \* \*

"The actual emperor is as amiable as his father. An amusing anecdote is related of him while heir-apparent, which might seem to indicate that he is not so deficient as is reported, did we not know that occasional sparks of wit are no proof of understanding. At a *soirée*, where 'question and answer' was the game, the question was put, 'Which is the strongest part of a man?' One gave his opinion for the leg, another opined for the arm, and so on. When it came to the King of Hungary's turn to reply, the courtiers were rather uneasy, knowing his oddness: but he relieved them by saying that he considered the nose to be the strongest part of a man. After the laugh had subsided at this unexpected selection, he was asked to explain. 'I think so,' he replied, 'because Prince Metternich, as you know, has led my father by the nose for twenty years, and yet the nose is as good as ever.'"

Baron Sturmer, the Austrian commissioner at St. Helena for two years, was our countryman's fellow-traveller down the Danube; and we are told:—

"Neither he nor his colleagues saw the emperor above two or three times, and therefore might nearly as well have been away. The baron assured me that the charges alleged against Sir Hudson Lowe were most unfounded; the real nature of the case being that it was impossible to please Napoleon, as may readily be imagined. The mighty spirit was imprisoned, and that expressed all. He could not forget the past or forgive the authors of his fall, as appears by his will, in which he left 10,000 francs to M. Cantillon, who was tried for an attempt to assassinate the Duke of Wellington; adding, that Cantillon had as much right to assassinate Wellington as that *oligarch* had to send him (Napoleon) to St. Helena. Napoleon's ill-will towards Sir Hudson Lowe was but the reflection of his feelings about Lord Castlereagh and the Duke of Wellington. History, I presume, will condemn the short-sighted policy which doomed Napoleon to a lingering death in a tropical island. Englishmen must regret in general that his letter to the Prince Regent from Plymouth Sound had not been answered by an invitation to take up his abode in England. That would have been a crowning crown to England's glory. Generosity to the vanquished is the noblest attribute of greatness. And England would have profited by the act. Time, which dispels illusions and rectifies prejudice, shews that even had Napoleon sought to re-enter France, he could no longer have injured England."

On the Danube, within thirty miles of the Euxine, "A few miles to the northward, at a hamlet called Czernavoda, we saw the canal, which, together with a wall, formed the line of defence made by Trajan, from the Danube to the Black Sea. One of our party, looking at the line on the map called Trajan's wall, and

him worthy of a better crown than the 'iron crown.' The following anecdote is of a lighter character, but equally shews the opinion entertained of the man. After his death, the model of a statue of him was placed for a few weeks, in order to judge of the effect, in the middle of the road leading from the palace to the adjoining gate of the city. It obliged carriages to make a slight circuit. In allusion to this, a writing was affixed to the statue making the departed emperor say: 'My friends, why have you placed me here, obstructing the road? You know I never, in life, stood in the way of my subjects.' \* \* \*

'I think so,' he replied, 'because Prince Metternich, as you know, has led my father by the nose for twenty years, and yet the nose is as good as ever.'"

not making out the name, asked the agent of the Steam Navigation Company, a simple Ragusan, who was standing by, what it was? He replied, '*Questo è il nome del signore che ha fatto questo canale*.' (That is the name of the gentleman who made this canal.) This answer diverted us, and, to elicit further amusement, we asked who this signore was. '*Era un famoso ingegnere, che si chiamava Trajano; e peccato ch'è morto prima d'aver finito el canale*.' (He was a famous engineer named Trajan; it is a pity that he died before having finished the canal)."

One neat anecdote more, and we have done:—

"The old Emperor Francis, of Austria, whenever a Russian general was to be presented, used to desire that the firmament might come in, in allusion to the number of his stars."

#### *The Laird of Logan.*

A NEW edition, in numbers, of this amusing and characteristic miscellany is in progress; from the first two of which we copy the following novelties (introduced among the elder jokes and anecdotes) to enliven our columns:—

"*The Effect of Habit*.—A diner-out in a certain gay city, in the land of cakes, had a recess of a couple of days in one week from his gastronomic labours. 'Do you know,' said he to a friend, 'that I went to bed sober two nights last week, and felt very little the worse for it?'"

"*A Doctrinal Preacher*.—A member belonging to the congregation of the Secession, under the late Mr. Pringle of Pollokshaws, went to see some old acquaintances who resided in the village of Kippen, Stirlingshire,—one of those privileged places, of which proverb says, 'out of the world and into Kippen.' The Rev. Mr. Anderson, clergyman of the parish, a gentleman of amiable manners, and assiduous in his attentions to the best interests of his parishioners, gave two or three sermons during the brief sojourn of the Seceder from Shaws, which pleased him exceedingly, as they happened to turn on high doctrinal points. Speaking of these discourses to Mr. Pringle on his return—'Yon's the preacher, Mr. Pringle—name o' your fusionless legal trash;—eh! but he's a terrible enemy to guid warks.'—[This is excellent. What a non-intrusion champion would this fine fellow make!]

"*Love at Sight*.—A servant girl, of no strong intellect, who lived with a lady in the neighbourhood of Paisley, one day surprised her mistress by giving up her place. The lady inquired the cause, and found it was that fertile source of dissension between mistress and maid-servant—a lad. 'And who is this lad?' inquired her mistress. 'Ou, he's a nice lad—a lad that sits in the kirk just forenent me.' 'And when does he intend that you and he should be married?' 'I dinna ken.' 'Are you sure he intends to marry you at all?' 'I daur say he does, mem.' 'Have you had much of each other's company?' 'No yet.' 'When did you last converse with him?' 'Deed, we hae na conversed ava yet.' 'Then how should you suppose that he is going to marry you?' 'Ou,' replied the simple girl, 'he's been lang lookin' at me, and I think he'll soon be speakin'.'—[This might have served as a hint for the author of "Glencoe" in his loves of Halbert and Helen.]

"*A Modern Jexebel*.—An old man, over whom the grey mare had tyrannised for many years, was visited on his deathbed by the clergyman of the parish, who urged on him

most faithfully the great importance of preparing for an eternal journey, on which he appeared just about to start. The veteran in carelessness appeared perfectly callous to the touching admonitions of the messenger of peace, when the clergyman struck a more alarming note, about the King of Terrors, and his fearful iron sway over his subjects. 'Weel, weel,' said the hardened sinner, 'I'm no fley'd [frightened] for the King o' Terrors; for I hae lived this sax-and-thretty years wi' the Queen o' them, and the King canna be muckle waur.'"

"*A Scotch Coroner*.—'This is a most tragical event which has happened,' said an individual to Bailie —, one of the high functionaries of a certain royal burgh. 'Bless me! what is it?' 'Why, your neighbour W—G— has committed suicide.' 'Wha on?' anxiously inquired the bailie."

"*Hope Deferred*.—'Go to bed, sir, in the closet there,' said an enraged father to a son, who had given him just cause of offence; 'were it not that these gentlemen are present, I would give you a sound whipping; but you shall have it before breakfast to-morrow, certain.' The little rebel went to his crib with a heavy heart, and the enjoyments of the party continued until a late hour. Just when the party was about to break up, the closet door was quietly pulled back, and the young offender put out his head, requesting that the sentence might be put in execution. 'Father, would ye just gie me my licks [whipping] this night, for I canna sleep without them?'"

"*A Highland Epitaph*.  
Here lie interr'd a man of micht,  
His name is Macom Downie;  
He'll lost his life one market nicht,  
In fa'ing aff his pounie.  
Aged 37 year."

*Poems, written in Newfoundland.* By Henrietta Prescott. Small 8vo. pp. 311. London, 1839. Saunders and Otley.

WHEN we open a volume of poems, it is with the intention of giving our honest opinion of its merits (for such as have no merit we have long since almost entirely ceased to notice), and, besides amusing our readers, offering the author the best advice we are able to give. Criticism thus becomes merely an opinion, and we make our remarks according to our belief in the talent of the work commented upon; for the very act of the author sending us the work is, on his or her part, an acknowledgment of our competence as judges. Still there are cases in which we give our opinions reluctantly—in which we consider the feelings of the writer, and so word our censure that it ought not to offend: thus reversing that excellent adage of "loving the child and not sparing the rod," for it is this very love that causes us to spare it. To be plain, we love this book too well to lash the author, although she deserves it for her negligence—for putting so much good poetry in so slovenly a style. She has built a beautiful house, to look at, but it is not well-finished; it will not stand so long, by many years, as it would have done had more pains been bestowed upon its foundation: her materials are excellent, but the fabric is badly put together. There is a look of hurry about it, the doors and windows do not fit well, the line and the rule have been neglected. We like it, and we like it not; have been both angry and pleased while going over it; and, were it our own, we would pull much of it down and begin the whole afresh. This is our honest advice and opinion, and now for a "brick" as a specimen:—

#### *"The Wallflowers."*

There stands a castle, old and grey,  
On England's southern shore;  
Its days of warlike pageantry,  
And pomp, and pride, are o'er;  
The din of arms, the clash of steel,  
Will sound there never more.

No banner waves upon its tower,  
The ivy o'er it creeps,  
The stones that tumble from the walls  
Lie in neglected heaps;  
And from each crevice, hole, and chink,  
The yellow wallflower peeps.

No cannon on the battlements,  
No sentry going his round,  
No strong portcullis at the gate,  
No warder's bugle-sound,  
No shout of soldiers in the hall,  
No bark of watchful hound.

The dungeons are half fill'd with earth,  
The prison-chambers bare;  
Between the iron-bars flows in  
The summer's scented air,  
And finds not now the captive band  
Who once were grieving there.

They say the Romans built that pile  
Hundreds of years ago;  
Since then new empires have grown up,  
And old ones are laid low,  
Yet still that castle looketh down  
Upon the waves' calm flow.

Green mossy turf and mallow flowers  
Now in the deep most spring;  
Rude brambles, laden with their fruit,  
To hoary buttress cling;  
And o'er the now deserted walls  
The sea-gull flaps his wing.

Yet all within the grass-grown court  
To ruin is not given;  
The chapel, where, in ancient days,  
Proud warriors' souls were shriven,  
Still, with its meek and ivied spire,  
Points upward to the heaven.

And still upon each Sabbath-day  
Throughout the peaceful year,  
Its modest bell rings out to bid  
The village crowd draw near,  
To worship in that quiet place  
With calm and holy fear.

No moan of 'hope deferred' is there,  
No captive's tearful sigh;  
The mother leads her children now  
Where buried warriors lie;  
And friends, within the churchyard's bound,  
May commune pleasantly.

But of the castle, old and grey,  
Not much I meant to tell;  
Unconsciously my thoughts have loved  
About its walls to dwell;  
I've seem'd to breathe the scented air,  
And hear the Sabbath bell.

A laughing train pass'd from my home  
One glad, bright summer's day,  
And down the straggling village street  
We took our noisy way;  
My mother, slowly following,  
Smiled kindly on our play.

We pass'd the moat and thick-barr'd gate,  
We pass'd the castle court,  
And then we sought the broken stair,  
And chambers of the fort,  
While e'en the dreary dungeon walls  
Gave echoes to our sport.

We climb'd the falling battlements  
To look upon the scene  
That stretch'd around the castle walls;  
Broad meadows, fair and green,  
The waters moaning far below,  
As they for aye had been;

And on the plain the parsonage  
With vine and rose o'er-grown,  
And, far away, the wide, wide hill  
On which our kite was flown,  
While o'er the blue and distant waves  
The white-sail'd vessel shone.

We turn'd not from that pleasant place  
Till eve began to fall,  
And when, with light and loving hearts,  
We heard my mother's call,  
I linger'd but to pluck the flowers  
That grow on crumbling wall.

Away! away! with bounding steps,  
Our young feet homeward sped,  
And then I ran to plant my prize  
In my loved flower-bed.—  
Alas! when morning came again  
My nosegay was all dead!

My mother smiled to see my grief,  
And I this truth was taught—  
That things which have no root will fade,  
And die, and come to nought.  
My children, when you would do right,  
Let this be in your thought!"

WRANGELL'S SIBERIA AND THE POLAR SEA.  
[Second notice.]

M. VON WRANGELL'S journeys over the ice, on sea and land, to survey the rivers and coast, were exposed to perils and privations almost too much for human endurance; but he relates their escapes and sufferings in a most modest and unaffected manner. Some extracts will shew this:—

"The 9th of April we continued our course in a south-east direction, until fissures, open water, and impassable hummocks, finally baffled all our efforts, and with broken sledges we had to retrace our steps to the last halting-place. The 10th was Easter-day, kept as a festival throughout the whole Christian world, but especially so in Russia. We joined in the prayers of our far-distant friends by the prescribed service, which was read by M. Bereshnoi, and the hymns were sung by our Cossacks and sledge-drivers. A block of ice was carved to represent an altar, and the only wax-light we possessed was burned in front of it. The day was one of rest and refreshment to all; our festive fare was frugal enough; we had reserved for it a few reindeer's tongues, and a little brandy; a much greater treat was a small fire, kept up during great part of the day.

On the next day we turned to the north, and came on the track left by the returning provision-sledges, which we followed across some hummocks. After accomplishing fifty wersts we halted in latitude 71° 4'. On the 14th of April we came on numerous fresh tracks of bears and stone-foxes, which made us very apprehensive for the fate of our store. I followed the tracks to the north-east, with three of the lightest sledges, and soon came on a deserted bear's den, a fathom deep in the snow, with two narrow entrances opposite to each other, and with just room enough to contain two bears. In the neighbourhood was a seal's hole, having on one side a raised bank of snow, through the lower part of which there was a small opening towards the ice-hole. The bears often throw up this sort of parapet close to a seal's hole, and lie in wait behind it; as soon as a seal creeps out from under the ice, he is caught by the powerful paw of the bear thrust through the opening, which at one pull draws him away from his only place of refuge, and he is then soon despatched. The boldness and dexterity of the stone-fox in venturing close to the bear, and carrying off part of the booty, are very remarkable. He is truly the bear's guest, and one generally finds the tracks of the two animals together.

Early in the morning of the 13th August we were disagreeably surprised, on waking, to find that our horses, which had been, as usual, grazing near us, had all disappeared, except one, which was old and feeble. They had probably been frightened and scattered by wolves or bears. We spent the whole day in a fruitless search for the fugitives, and returned to our tent late at night, weary and disappointed; the last biscuit had been eaten the day before, and a little tea and sugar were the only provisions which we had remaining. Our difficulties were further increased by finding that the Jukahir, who was supposed to be our guide, did not know where we were. He said that the hills before us were quite unknown to him, that the summits which he saw to the south were quite unlike those which approach the lesser Aniuj, in the neighbourhood of Konowalow, where his tribe sometimes reside, and that we must still be a long way from the summer habitations of the Jukahiri. Unavoid-

able errors in reckoning might certainly cause some uncertainty in my determinations of longitude, but our Jukahir was not even able to say whether we were too far to the east or to the west. He was to far bewildered that he did not even recognise the Poginden river. The provisions being expended, our case seemed a bad one; there was no time to be lost in reaching the Aniuj, which would conduct us to some inhabited place; I determined to continue our journey next morning on foot, if the horses were not found. Early in the morning of the 14th, we packed up our tent and most of our things, and hid them in a place which could be easily recognised. We took with us our tea apparatus, and the instruments, and loading the old horse with them, continued our journey on foot through rain and wind. We avoided the marshy places as much as possible, and made across low hills, towards the mountains to the south of us. It was a laborious day's march, sometimes wading through morasses, and across deep and rapid streams, and sometimes forcing our way through tangled thickets. At the end of eight hours' exertion, we were so exhausted, that we were forced to halt, though we had only accomplished fifteen wersts. Luckily the rain ceased, and we had the comfort of drying ourselves and our clothes by a good fire; and after taking our unsubstantial supper of tea, we slept tolerably soundly, caring little for the absence of shelter. The next morning hunger made itself felt in good earnest, and became every hour more urgent. We were at first in hopes of finding in the burrows of the field-mice, the sweet mealy root called Makarscha, which often affords a resource to the Jukahiri in such cases as ours; but the mice do not burrow in marshy ground such as we were now on, and we found ourselves obliged to have recourse to another expedient in use here. We chose a healthy young larch-tree, peeled off the outer bark, and then cut the soft inner bark into small pieces, which we boiled until the surface of the water in the kettle became covered with a resinous scum, which was carefully removed; the broth was then seasoned with salt and pepper, and in spite of the remaining particles of turpentine, it tasted well, and filled the stomach. We took it in moderation, and felt no ill effects from it. Whilst we were breakfasting, the sky became overcast, and it rained occasionally throughout the rest of the day; the hills rose gradually into mountains, as we advanced towards the place, where, by my reckoning, I expected we should find the Aniuj. After a march of thirteen wersts, we reached the highest point of the mountain-chain, whence we had a view of the surrounding country. The mountains still continued to the south-west; but immediately in front of us, to the south, was a deep valley, at the bottom of which we at length descried the eagerly-looked-for Aniuj. Our Jukahir instantly recognised the valley, the river, and the winter habitation of his tribe, with loud exclamations of joy; and in spite of weariness and hunger, broke out into a merry national song. I was especially rejoiced at this confirmation of the correctness of my reckoning. We had still before us nine wersts and a half to the river, and two wersts more to the little settlement of Konowalow, which we hoped to reach before night; but when we gained the bank of the river, after an uninterrupted walk of eleven hours and a half over difficult mountain-paths, we were so completely knocked up, that we preferred passing the night in the rain to attempting to proceed any further. Our Jukahir offered to go on to Konowalow, and to bring

us some provisions from thence. We impatiently awaited his return round a good fire. He came back at the end of an hour and a half, empty-handed; he had looked into all the store-places of the inhabitants, who were absent on their various summer excursions, and had found nothing but melancholy evidence of the scarcity which must have prevailed. Too much wearied to begin preparing bark-broth, we comforted ourselves as well as we could with tea, and with the assurance of finding inhabitants and provisions, twelve wersts off, at Ostrownoje. We started early in the morning of the 16th, and arrived there after a march of three and a half hours, but only to meet a fresh disappointment. The inhabitants were absent for fishing or hunting, and had taken with them whatever had been left in their provision stores, which were perfectly empty. Much cast down, we set about preparing another meal of bark-broth, whilst two of our party went on to a summer habitation six wersts off, at the foot of the Obrom mountain, where some of the Jukahiri usually await the migrating reindeer, and where I hoped to procure some provisions from their chief. He actually did send us all the remainder of his provisions, consisting only of a piece of reindeer meat, two reindeer tongues, and one fish. Our people brought us a sad account of the severe distress that had prevailed for some time past. The spring reindeer chase had failed, and even now, when the deer were in full migration, not a single one had yet been killed by these poor starving people.

On the 24th we climbed a lower range of hills, from the summit of which, to our great joy, we saw a wide valley, with numerous groups of trees; and by nightfall we reached a small lake at the foot of the hills. I now proposed to kill one of the horses, but the Jakuti said, that in the heated state of their blood, the use of their flesh as food would be certain to occasion severe illness. We had just strength enough remaining to place a net in the lake, before we sunk on the ground exhausted with hunger and fatigue. The sun was high when we woke next morning (25th of August); no one seemed willing to draw the net, for all feared that it would contain nothing, and dreaded to be assured that it was so; when at length we made the effort, and the net was drawn, it contained three large, and several smaller fishes: expressions of thanksgiving, of joy, and of mutual congratulation, were heard on every side; a fire was made in a few moments, and an excellent broth, seasoned with wild leeks and herbs, soon appeased our hunger, and in great measure restored our strength.

The severe cold was daily decreasing. On the 26th of March, with a mild S.S.E. breeze, we had, in the morning, a temperature of +27°, and, in the evening, of +14°. Our patient was better for the twenty-four hours' rest which we had allowed him, but was still quite unable to drive. Every hour increased the danger of remaining where we were; and M. Kosmin, always ready to do the utmost in his power, undertook to drive the sledge, putting the sick man into his own place. We could not, by any contrivance, manage to carry all our provisions with us, and we had only to hope that we might be able to fetch away such part as we were obliged to leave. After driving only three wersts, we found our old track completely obliterated by fresh hummocks and fissures, which rendered our advance so difficult

† The Jakuti have such appetites that they will devour sixty fish in a day, of the same size of which ten were quite sufficient for their visitors.

that we were at last forced to abandon a part of the stores which we carried. After toiling on for two wersts more, we found ourselves completely surrounded by lanes of water, opening more and more, until, to the west, the sea appeared completely open with floating ice, and dark vapours ascending from it obscured the whole horizon. To the south we still saw what appeared a plain of ice, but it consisted only of larger fragments, and even these we could not reach, as we were separated from them by a wide space of water. Thus cut off on every side, we awaited the night with anxiety; happily for us, both the sea and the air were calm, and this circumstance, and the expectation of a night-frost, gave us hope. During the night a gentle breeze sprung up from the W.N.W., and gradually impelled the ice-land, on which we were, towards the east, and nearer to the larger surface before mentioned. In order to get over the remaining space, we hooked with poles the smaller pieces of ice which floated about, and formed with them a kind of bridge, which the night frost cemented sufficiently to admit of our crossing over upon it before sunrise on the 27th. We had hardly proceeded one werst, when we found ourselves in a fresh labyrinth of lanes of water, which hemmed us in on every side. As all the floating pieces around us were smaller than the one on which we stood, which was seventy-five fathoms across, and as we saw many certain indications of an approaching storm, I thought it better to remain on the larger mass, which offered us somewhat more security; and thus we waited quietly whatever Providence should decree. Dark clouds now rose from the west, and the whole atmosphere became filled with a damp vapour. A strong breeze suddenly sprung up from the west, and increased in less than half an hour to a storm. Every moment huge masses of ice around us were dashed against each other, and broken into a thousand fragments. Our little party remained fast on our ice-land, which was tossed to and fro by the waves; we gazed in most painful inactivity on the wild conflict of the elements, expecting every moment to be swallowed up. We had been three long hours in this position, and still the mass of ice beneath us held together, when suddenly it was caught by the storm, and hurled against a large field of ice; the crash was terrific, and the mass beneath us was shattered into fragments. At that dreadful moment, when escape seemed impossible, the impulse of self-preservation implanted in every living being saved us. Instinctively we all sprang at once on the sledges, and urged the dogs to their full speed; they flew across the yielding fragments to the field on which we had been stranded, and safely reached a part of it of firmer character, on which were several hummocks, and where the dogs immediately ceased running, conscious, apparently, that the danger was past. We were saved; we joyfully embraced each other, and united in thanks to God for our preservation from such imminent peril. But the continued raging of the tempest, and the crashing of the ice around, warned us not to delay; and, after a few moments' repose, we hastened onwards, guided by our view of the coast, to our first deposit of provisions, four wersts from the shore. There we loaded our sledges with as much as they could carry, and before it was perfectly dark reached the land. We passed the night near the mouth of the Werkon, where an overhanging cliff afforded some protection from the storm, and enabled us to light a fire, and to refresh ourselves with

food and tea, of which we stood greatly in need."

The formidable white bears are often encountered, and occasionally killed, not without risk; but the extraordinary apparition of animal life seems to belong to the deer:—

"The true harvest, which we arrived just in time to see, is in August or September, when the reindeer are returning from the plains to the forests. They are then healthy and well fed, the venison is excellent, and as they have just acquired their winter coats the fur is thick and warm. The difference of the quality of the skins at the two seasons is such, that whilst an autumn skin is valued at five or six roubles, a spring one will only fetch one, or one and a half rouble. In good years the migrating body of reindeer consists of many thousands; and though they are divided into herds of two or three hundred each, yet the herds keep so near together as to form only one immense mass, which is sometimes from 50 to 100 wersts in breadth. They always follow the same route, and in crossing the river near Plotischtsche, they choose a place where a dry valley leads down to the stream on one side, and a flat sandy shore facilitates their landing on the other side. As each separate herd approaches the river, the deer draw more closely together, and the largest and strongest takes the lead. He advances, closely followed by a few of the others, with head erect, and apparently intent on examining the locality. When he has satisfied himself, he enters the river, the rest of the herd crowd after him, and in a few minutes the surface is covered with them. Then the hunters, who had been concealed to leeward, rush in their light canoes from their hiding-places, surround the deer, and delay their passage, whilst two or three chosen men armed with short spears dash into the middle of the herd and despatch large numbers in an incredibly short time; or at least wound them so, that if they reach the bank, it is only to fall into the hands of the women and children. The office of the spearman is a very dangerous one. It is no easy thing to keep the light boat afloat among the dense crowd of the swimming deer, which, moreover, make considerable resistance; the males with their horns, teeth, and hind legs, whilst the females try to overset the boat by getting their fore-feet over the gunnel; if they succeed in this, the hunter is lost, for it is hardly possible that he should extricate himself from the throng: but the skill of these people is so great, that accidents very rarely occur. A good hunter may kill 100 or more in less than half an hour. When the herd is large, and gets into disorder, it often happens that their antlers become entangled with each other; they are then unable to defend themselves, and the business is much easier. Meanwhile the rest of the boats pick up the slain, and fasten them together with thongs, and every one is allowed to keep what he lays hold of in this manner. It might seem that in this way nothing would be left to requite the spearmen for their skill and the danger they have encountered; but whilst every thing taken in the river is the property of whoever secures it, the wounded animals which reach the bank before they fall belong to the spearman who wounded them. The skill and experience of these men is such, that in the thickest of the conflict, when every energy is taxed to the uttermost, and their life is every moment at stake, they have sufficient presence of mind to contrive to measure the force of their blows so as to kill the smallest animals outright, but only to wound the larger

and finer ones, so that they may be just able to reach the bank. Such proceeding is not sanctioned by the general voice, but it seems nevertheless to be almost always practised. The whole scene is of a most singular and curious character, and quite indescribable. The throng of thousands of swimming reindeer, the sound produced by the striking together of their antlers, the swift canoes dashing in amongst them, the terror of the frightened animals, the danger of the huntsmen, the shouts of warning advice or applause from their friends, the blood-stained water, and all the accompanying circumstances, form a whole which no one can picture to himself without having witnessed the scene. When the chase is over, and the spoils are distributed, the deer which have been killed are sunk in the river, the ice-cold water of which preserves them for several days, till there is time to prepare them for winter use. For this purpose the flesh is either dried in the air, smoked, or, if early frosts set in, frozen. The Russians sometimes salt the best pieces. The tongues are considered the greatest delicacy, and are reserved for special occasions. . . .

I had hardly finished the observation, when my whole attention was called to a highly interesting, and to me, a perfectly novel spectacle. Two large migrating bodies of reindeer passed us at no great distance. They were descending the hills from the north-west, and crossing the plain on their way to the forests, where they spend the winter. Both bodies of deer extended further than the eye could reach, and formed a compact mass, narrowing towards the front. They moved slowly and majestically along, their broad antlers resembling a moving wood of leafless trees. Each body was led by a deer of unusual size, which my guides assured me was always a female. One of the herds was stealthily followed by a wolf, who was apparently watching for an opportunity of seizing any one of the younger and weaker deer which might fall behind the rest, but on seeing us he made off in another direction. The other column was followed at some distance by a large black bear, who, however, appeared only intent on digging out a mouse's nest every now and then, so much so that he took no notice of us. We had great difficulty in restraining our two dogs, but happily succeeded in doing so; their barking, or any sound or motion on our part, might have alarmed the deer, and by turning them from their course, have proved a terrible misfortune to the hunters, who were awaiting their passage, on which they are entirely dependent for support. We remained for two hours whilst the herds of deer were passing by, and then resumed our march."

Next to deer-hunts, the hunting of geese appears to be both exciting and useful:—

"On the 19th the weather improved, the hills became lower, and the valley gradually widened, until when we halted for the evening it was above twenty wersts broad, and we began to meet with the small lakes which characterise the tundras. M. Bereshnoi found a mammoth's tooth here, and I shot a fat wild swan, which, at the time, was rather the better prize of the two, as our stock of provisions was reduced to a few biscuits. It was, moreover, a good omen, for we were woken early the next morning by the noise of immense numbers of moulting geese which almost covered the lake near us. We were soon on horseback, and armed with bludgeons surrounded the lake that they might not escape; our dog drove them on shore, and we knocked down seventy-five. Less experienced than my companions in the use of the weapon, and less well acquainted

with the tricks of the geese, which rather resemble foxes in cunning, I only succeeded in killing one. When I saw them lying on the ground with their necks and legs stretched out quite stiff, I passed them by, thinking them dead, and went on to try to knock down others; but when I turned back to pick up the slain, they slipped out of my hands with wonderful agility. The natives are never taken in by them in this way; they deal their blows on every side with remarkable skill and quickness, and the whole scene presents on a much smaller scale somewhat of the animation of the autumn reindeer hunt. In great spirits at this seasonable supply, we loaded our horses with the game, and continued our route towards the coast."

[Conclusion in our next.]

*Nicholson's Cambrian Traveller's Guide in every Direction; containing Remarks made during many Excursions in the Principality of Wales, augmented by Extracts from the Best Writers.* Third Edition. Revised and Corrected by his Son, the Rev. Emilius Nicholson, Incumbent of Minsterley, Salop. 8vo. pp. 668. London, 1840. Longman and Co.

It is not our practice to review mere reprints of former publications, whatever be their merit and their claims upon the public patronage. The work before us does not, however, properly rank under this description. Though purporting to be the *Third Edition*, it now presents itself in a form so altered and improved in respect to the arrangement and the materials as to warrant our treating it as substantially a new production.

Road-books, as a class, must be considered indispensable companions to travellers who explore regions which are either altogether new, or but partially known, to them. Before they commence their journey they may, indeed, acquire a tolerably just and accurate notion of the geographical position and the principal natural features of the country they are about to visit: but when they have advanced within its confines, they will soon find themselves bewildered and perplexed in their movements, unless they are provided with written instructions to direct their steps in the course which it would be most for their advantage to pursue; which would give them the only chance of seeing, or of seeing in the best manner, the chief objects of curiosity and interest, and secure for them the largest measure of instruction and rational amusement which the scenes they are viewing may be adapted to impart.

"The principality of Wales constitutes now, as it always has done, one of the most important and interesting portions of Great Britain. Regarded as a separate and distinct district, it stands unrivalled by any other division of the British islands of equal extent and population. If we look to the boldness and sublimity of its mountains, to the singular and ever-varying beauties of its valleys, its lakes and its rivers, to its very remarkable geological conformation, to the rich and varied productions of its mines, to its flourishing manufactures, which impart animation to its most secluded districts;—if we glance at the numerous objects of antiquity which every where present themselves to observation,—British, Roman, Saxon, Norman, civil and ecclesiastical;—if we advert to the language, the manners, and usages of the inhabitants, presenting, as they do, striking traces of their remote origin as a distinct people, we must at once perceive that Cambria offers to notice and admiration a combination of objects and circumstances

such as are to be found in no other separate part of these isles, and which must be admitted to be, in a great measure, peculiarly its own. Such, indeed, is the physical aspect of this romantic and delightful region, and such the remarkable peculiarities of the people, as to their speech and their customs, that an Englishman who does little more than cross the borders finds himself in the midst of a scene so novel and strange that, with very little effort of the imagination, he might fancy himself transported to a country far distant from his native land."

It is, we think, to this circumstance chiefly, that we must ascribe the passion which has for many years prevailed for travelling in Wales, —a passion which must, we are confident, prevail more and more in proportion as its numerous attractions are familiarised to our knowledge, and appreciated by our judgment and taste.

And may we not conjecture that it was some feeling of this sort which led Mr. Nicholson, the original intelligent and industrious compiler of *The Cambrian Traveller's Guide*, to turn his attention to this work, and devote his researches and his labours to provide a suitable directory for those persons whose curiosity might impel them to make the tour of the principality? Mr. Nicholson seems to have strongly felt that the ordinary class of itineraries and road-books, though furnishing much useful information, were open to the objection of embodying it in an unattractive form, offering to the reader little more than a dry enumeration of routes, and distances, and names of places. These are, no doubt, matters of importance for the traveller's guidance, which cannot well be dispensed with. But Mr. Nicholson was aware that, however correctly instructed as to these particulars, he would need something more to stimulate his activity and perseverance, and fit him for the full relish of the pleasures that awaited him. Much of the gratification of the traveller, he well knew, is derived from anticipation—from the foretaste of those pleasures which he reckons upon deriving from the contemplation of the wonders of nature and art as he proceeds. Our intelligent editor, therefore, abandoned the common plan of road-books, and substituted that which forms the great excellence of his work. His main purpose, which he has very happily accomplished, has been to accompany the description of any particular route by a somewhat detailed account of the chief objects of interest and gratification which it will present to the traveller as he advances, and by this means to stimulate his curiosity, and animate his zeal, in their pursuit.

The present work does not sketch out any one grand route which would conduct the traveller over the whole, or the more important parts, of the principality. The editor has selected and arranged in alphabetical order certain principal towns, villages, and other places of prominent consequence, distinguished by general or local notoriety, which he has converted into main stations, or starting-points, from each of which the traveller may take a mental glance of the surrounding district; ascertain what objects of curiosity and interest they comprise; and then form his plan for exploring them at his leisure. So judiciously have these main stations been chosen, that the editor has been able to introduce under them, in an easy and agreeable manner, and with all the spirit of an original tourist, a tolerably full account of even the more minute divisions of every district which presents any thing of consequence to tempt the footsteps of the stranger.

Our limits preclude the illustration of this brief account of the editor's plan by quotations from the work. We must leave our readers to satisfy themselves by a personal inspection.

We have looked carefully through the book, prepared for the perusal by a pretty accurate personal acquaintance with both divisions of the principality, and we can confidently state that no portion of material importance has been passed over without due notice, and being rendered easily accessible by the editor's instructions. Considerable parts of the book comprise, as we have before intimated, original accounts drawn up by the compiler and the present editor. These are written in a neat, perspicuous style. The other parts are made up of selections from the most approved and popular published travels through this country, including those of Sir Richard Hoare, Mr. Evans, and Mr. Bingley, who justly rank among the best authorities on the important subjects of the antiquities, the history, the mineralogy, and botany of Wales. These selections have been made with great judgment, and have been so skillfully dovetailed, or incorporated with the general matter, as to give to the whole the appearance of perfect coherence and uniformity.

In conclusion, we have great pleasure in remarking that Mr. Nicholson has here furnished the Welsh tourist with a very excellent and agreeable *vade mecum*; and we cordially recommend all persons who may hereafter resolve to explore the interesting beauties of the principality, to place in their carriage or knapsack, as the case may be, *The Cambrian Traveller's Guide*, as a companion at once eminently instructive and amusing.

*Memoirs of a Cadet.* By a Bengalee. 12mo. Pp. 338. London, 1839. Saunders and Otley.

THIS is a very slight affair, without sufficient stamina to warrant publication. It contains a few good hints for young military adventurers in India; itineraries of marches to Cawnpore, Agra, and other places; and some occasional sketches of European society in the East: but nothing, as a whole, which could recommend it strongly in the way of utility to any class of persons interested in such matters. Merely to pass an idle hour, it may be taken up and skimmed; but for the rest we can say no more.

We select two or three passages, as samples of the best parts which we have been able to discover. And first a description of a companion, and estimate of the Scotch character:—

"Jemmy Thomson was a 'canny Scot,' and steady as old Time. Economical, though not inhospitable, he was well fitted to make his way in the world, and one of those who, you may almost calculate upon, are destined to retire, after the full period of their service, to their native land, with a comfortable sufficiency for the autumn and winter of their lives. I am much attached to the Scotch. Most of my best and kindest friends in India have been of that nation. I have almost invariably found them hospitable, often profuse; and even in many instances, where the bump that manifests an economical propensity has been prominently developed, I have seen it exercised more in the way of self-denial than illiberality. All rules have exceptions; and therefore this is not assumed to be an exception to all rules, but it is very nearly correct, so far as has fallen within my own ken."

A curious account of a snake-hunt will amuse the reader:—

"One evening as a small party of us were

enjoying our vesper stroll, accompanied, according to custom, by a number of dogs of little inferior note to Fielding's immortal 'Thunder and Plunder and Wonder and Blunder,'

('Great heroes were they all,')

we had an opportunity of witnessing an extraordinary encounter between them and a large cobra de capello, or hooded snake. The ground we were traversing was swampy, with here and there growing upon it an herbaceous plant called by the natives mudar, and I know no other name for it. It bears a purple flower in clusters; and a thick, milky, and very pungent sap exudes from it when a branch or a leaf is broken off. Near the roots of many of these plants were holes resembling rabbit-burrows. Suddenly one of the dogs (a spaniel) which had been hunting about at some distance in advance of us, gave a yell which summoned the others to him, and we followed as fast as our bipedal powers would permit us. The dogs united in a general howl, and when we came up with them, we found them scratching almost madly in the neighbourhood of one of the above-mentioned holes, but at a very respectful distance from it, for from its interior issued an indescribable sound which might have appalled a lion. As near as I can convey the idea of it, it was a fierce hissing mingled with a growl. Conceiving that the tenant of this asylum might be a weasel or some animal of that tribe, we poked at the aperture with our sticks, and cheered the poor dogs on to an assault. We could not, however, with all our endeavours, induce our best dog, though a noted scratcher, to invade the sanctuary; on the contrary, it appeared to be his object to fill up the hole, by throwing the earth into it. He also bit off every branch of the mudar plant, laying each cautiously over the same place. At this time, one of the party suggested that the occupant might be a snake; whereupon we would have called off the dogs, but they were under the influence of a spell, and paid not the least attention to us. At length, to make a long story as short as with justice I can, an enormous cobra de capello burst forth, furiously enraged. On the first appearance of his head, the four-footed tribe retreated a few yards, then halted, turned, and held the foe at bay, whilst the rational portion of the party commended themselves to the protection of those locomotive engines so well spoken of in 'Hudibras,' and so naturally referred to on such occasions. Our ignominious flight continued to the full distance of twenty paces, when we halted and faced about. We then witnessed a most extraordinary spectacle. In the centre of a large circle formed by the dogs rose the snake, with hood distended, and about a yard of his body erect, gracefully curved like the neck of a swan. In this attitude he wheeled rapidly about, fixing his diamond-like eyes, quickly as light, on any antagonist, which, bolder than the rest, attempted to draw the circle close around him. This war of 'demonstrations' lasted for perhaps a quarter of an hour, the dogs barking furiously all the time, when one of them (the spaniel too) made a spring upon the reptile, when his head was partly turned in another direction; but he underrated the activity of his foe, and was bitten. A general attack now commenced, and the snake was soon torn to pieces. He died not unavenged, as Byron says. Two of the dogs received their death-wound, each bitten in the upper lip; viz. the spaniel before mentioned, and a valuable Scotch terrier. For about ten minutes afterwards, their spirits appeared to be unusually excited; they then began to sicken

and retch, though they were unable to vomit; violent convulsions and death soon succeeded. The spaniel, which was first bitten, died in about twenty minutes, and the terrier half an hour after the infliction of the wound. Eau de luce would have saved them, had we had it at hand. I have myself witnessed the cure of a man who was bitten by a very venomous snake: he was restored by a teaspoonful of eau de luce, given in half a wine-glass of water; and although he was in a high state of insensibility, foaming at the mouth, and with his pulse apparently gone, yet in less than twenty minutes he became convalescent and able to walk stoutly. Every European—man, woman, and child at the place, was furnished with a vial of eau de luce by the next evening. The natives have an admirable plan of resorting to charms and mantras when one of their companions chances to be bitten by a snake, which they persevere in with exuberance of faith, till he dies: then, but not till then, should they happen to be near a British station, they convey their dead friend to the doctor to be cured. I have seen this."

We conclude with a pleasant anecdote; though certainly the reverse to all parties concerned.

"Once upon a time," an officer was travelling dak (post). When the recumbent position became irksome to him, he alighted to walk; and on one of these occasions he was attacked by a bear at a little distance from his attendants. Being armed only according to Nature's provision, he was obliged to wrestle with his assailant. During the struggle the bearers came up; but instead of tendering their assistance to the gentleman, they formed a circle round the contending parties, like bold Britons at a dog-fight, and expressed the interest they took in the contest by clapping of hands, and the following encouraging cheers—"Wah, wah, sahib!" or "Wah, wah, bhaloo!"\* as the chance of victory fluctuated from one side to the other. The officer was fortunately a strong man, and after a long struggle came off triumphant. At the end of the stage, in order to reward the tender interest the bearers had taken in the preservation of his honour, he delivered them over to the cutwal, the chief civil authority, who awarded to each of them an external application of bamboo, instructing at the same time the executive to call out during the administration, "Wah, wah, bans!" "Wah, wah, peeth!"†

*Manuals of Natural History: Geology.* By William Macgillivray, A.M. F.R.S.E., author of a "History of British Birds." Small 8vo. pp. 248. London, 1840. Scott, Webster, and Geary.

THIS is the first of a series of essays on natural history offered, to use the author's own words, "to those who are desirous of obtaining a knowledge of the various branches of that interesting department of science, in a systematic manner, and at as little expense of time and money as the subject will admit." That the task will be accomplished in a manner worthy of its subject, the name of the author is a sufficient guarantee. Mr. Macgillivray may well be termed the "Buffon of Scotland;" his ardour in the cause of nature equals his ability. The commencement is upon Geology; a science which has so potently engrossed the minds of its devotees,

as to render them complete enthusiasts. To the uninitiated, Mr. Macgillivray lays open its secrets in his usual clear and elegant style. Referring to certain religious objections made to geology, he says:—

"Some authors, in treating of it, having confined their view to a particular aspect, which seemed to them especially interesting; while others have indulged in unfounded conjectures respecting the origin and duration of the object to which it refers, and not a few have striven to render it a criterion of the truth of Revelation, or have exultingly announced, that the strata of the globe disclose a philosophy contradictory to the Mosaic account of the creation. As might be expected, many persons have imbibed a prejudice against the study, believing it to lead to scepticism; but the crude reasonings and unwarranted speculations that attend the progress of every branch of natural history, being gradually shewn to be inconsistent and futile, ought not to be considered as impediments in the search for truth; and at the present day, in our happy country at least, attempts to subvert the moral government of the world find little favour with those who are moderately informed. Indeed, a reaction has very naturally taken place, so that in the minds of many the positive truths of geology are apt to be confounded with the idle fancies of its cultivators. But this science is not more implicated with revelation than botany or zoology, against which no religious prejudice exists; and it is time that men should cease to bring them into collision."

He concludes his book with a noble generalised view of the formation of the globe.

From a work so compact it is almost impossible to select an extract to give an idea of the whole. We content ourselves with the following passages on the subject of coal:—

"143. *Coal-Formation.*—In an economical point of view this is the most important of all the series of deposits, and in a geological it is of great interest on account of the multiplicity of organic remains which it contains, and the various phenomena which it presents. In the north of England, the strata of sandstone, shale, ironstone, and coal, of which it is composed, are 3000 feet thick, and in Derbyshire 2500. But the quantity of coal found in this great mass of rock bears a very small proportion to it, the thickest bed of English coal being from thirty to forty feet, and the aggregate thickness of all the beds in a coal district not often exceeding from forty to sixty feet. The strata of the coal-formation are usually disposed so as to form a basin or trough, and in the different coal-fields which occur in England, Germany, and other countries, they are not uniformly arranged, but each coal district has its peculiar series, varying in thickness and disposition. In a section of the Moira coals mine in Leicestershire, given by Mr. Bake-well, there are about 130 distinct strata, comprising ten beds of coal, and twenty seams of ironstone and strata containing ironstone. The main-coal is from thirteen to fourteen feet in thickness, containing twenty seams of coal of different qualities."

"144. *Arrangement of the Strata.*—Coal-deposits, or, as they are usually called, coal-fields, generally occupying hollows or plain-intervening between two ranges of high ground, have their strata arranged somewhat in conformity with the surface of the subjacent deposits, and thus in a section present the appearance of curved and parallel layers, often, however, variously disarranged by fissures,

\* "Wah, wah, sahib!"—Wah, wah, bhaloo!—Well done, gentleman! Bravo, bear! or, Now, gentlemen—now, bear! ad lib."

† "Wah, wah, bans!"—Wah, wah, peeth!"—Bravo bamboo! Bravo, back!"

which are, when large, filled with some hard rock of the kind usually named trap. Frequently when extended over a large district they present a series of undulations, and when no other deposit lies over them, the eminences thus formed have been as it were abraded and their parts dispersed, which is more especially the case with elevated portions of strata caused by dikes or fissures. The explanation of this phenomenon usually given has reference to diluvial currents that have swept over the surface of the land; but Mr. Bakewell accounts for it by supposing the strata to have been still in a soft and yielding state when the forces by which they were dislocated acted upon them, and thus to have been submitted to the violent action of water when, having been suddenly broken and forced upwards, they were still beneath the surface of the ocean."

## MISCELLANEOUS.

*Juvenile Delinquency in Manchester: its Causes and History, its Consequences, and some Suggestions concerning its Cure.* By William Beaver Neale, Esq. 8vo. pp. 80. Manchester, 1840. Hamilton.

MUCH attention has been of late directed to the suppression of juvenile delinquency. Legislative measures have been carried and are in progress to facilitate and further this most desirable object. These are, however, of necessity of a too general nature to do permanent good: they are insufficient of themselves to check the growth of the noxious weed; they clip the more luxuriant shoots, but leave the strength of the creeping thing unimpaired, and the root deep in the soil of misery and ignorance, to swell and to spread. Better the condition of the poor, improve their habitations, remove children from the baneful influence of dishonest and profligate parents, and provide for the rising generations moral, religious, and industrial education; and a few years will shew a vast diminution of crime. These operations are, however, prospective; and the evil is so great that something more immediately effective must be done. The Juvenile Offenders' Bill might, perhaps, be beneficial in some degree; but it behoves all local authorities and individuals of influence to co-operate, each in their own sphere. Manchester has been the field, and a fertile one, wherein the labours of Mr. Neale have been employed. He has explored and exposed the horrors—the wretchedness, with which the early years of the neglected offspring of the poorer classes in that manufacturing town are surrounded: those dens of iniquity, the low beer and spirit-shops, and the threepenny lodging-houses, in which the juvenile offenders, as well as adult criminals of both sexes, promiscuously pass their days and nights; and the consequent degraded and reduced condition, moral and physical, of the beings subjected to their influence, the imperative motives for a continuance in guilt, and the impossibility of self-reformation. Amongst the first remedies within the reach of such a community as Manchester, which is also applicable to all manufacturing districts, he suggests the establishment of a penitentiary for juvenile delinquents; treats of the internal economy of such institutions, the objects to be had in view, and the means to be employed for their accomplishment; also of the mode of disposing of reformed delinquents. The establishment of infant and primary schools, where a religious, mental, and industrial training would be supplied, and an improvement in the habitations of the poor, without which any scheme for ameliorating the condition of the people would

fail, are strongly enforced. Mr. Neale's pamphlet contains practical information and suggestions worthy the attention of the philanthropist and of the legislator.

*Instructions in Gardening for Ladies.* By Mrs. Loudon, authoress of "The Ladies' Flower Garden," &c. Pp. 406. London, 1840. Murray.

As it cannot be the fortunate lot of very many ladies to marry accomplished gardeners, Mrs. Loudon, having enjoyed that good luck, very naively professes to teach them the amount of what she has herself acquired since her union with Mr. Loudon. Previous to that event she knew nothing of the subject, and chagrined at finding herself ignorant where others in her family circle were so well informed, she with a right feeling heartily applied herself to learn what, after ten years' experience, she now ventures to communicate to those who have not met with similar opportunities. She justly remarks, that scientific and professional writers are not so likely to be intelligible and useful to amateurs as one who has felt the full extent and nature of the instruction which is necessary for the cultivation of this delightful pursuit. We need only add that her little volume fulfils every promise, and is a perfect *vade mecum* of the art in all its branches. No. III. of her "Ladies' Flower Garden—Bulbous Roots," is beautifully rich with Babiana, Watsonia, and other charming flowers.

*Fidelio, Don Juan, Faust, Der Freischütz, Kosciuszko, Das Nachtlager in Granada, and Euryanthe.* London, 1840. Schloss.

THESE translations of the German pieces now performing at the Prince's Theatre deserve more than the merit of being guides to the performances. German students will find them valuable aids to the better understanding of the language.

*The Age of Lead, a Satire.* By Edward Wallace, Esq. Pp. 89. London, 1840. Marsh.

IN this satire, poetic justice is dealt out pretty unsparingly upon many men and matters of our day. The subject does not tempt us into analysis or extract, and we have only to state that, though carelessly done, there is proof of considerable power and talents in the composition.

## ARTS AND SCIENCES.

## SOCIETY OF ARTS.

ON Tuesday evening, the last illustration for this session took place. William Pole, Esq. V.P. in the chair.—The subject was Iron, by Mr. Henry Wilkinson. Mr. Wilkinson stated that his object in the illustration was to bring before his auditors some remarkable facts respecting iron, in a miscellaneous manner, rather than to enter into the chemical or mechanical properties of the metal. He adverted to many specimens exhibited on the table; which, he observed, had no further connexion with his immediate subject than being made of iron—an article which has been applied to numerous useful purposes by every civilised nation, but which has never been so extensively employed as at the present period. We have iron roads and iron carriages;—he anticipated that the "wooden walls of old England" would probably be made of iron in another century. Numerous steamboats are already constructed of that material; the cushions of our chairs are stuffed with iron, in place of horse-hair: indeed, not only our bedsteads, but even our feather-beds (to use an Hibernicism), are made of iron. These were merely mechanical applications of that important metal. When we

were told of living animals whose bodies were composed almost wholly of iron, incased in flint, and that these animals feed on plants, have the power of motion, and can live in muriatic acid, it may at first excite a smile of incredulity; nevertheless, he observed that Professor Ehrenberg had discovered that the bog-iron ore, from which the beautiful Berlin castings are made, originates from an animalcula that once had life, the whole mass being composed of the bodies of myriads of these animals. That the Tripoli or polishing powder so extensively used in the arts, and in Berlin, to form the casting moulds in the iron-foundries, is entirely composed of the shells of similar animalculæ, capable of bearing a red heat without destroying their outer coating or shell. Dr. Faraday had shewn that iron would remain for months in strong nitric acid without the slightest action taking place: he had proved that when chemical action ceases, electrical action ceases also, and *vice versa*; and has also proved that platinum and carbon act as protectors to iron under such circumstances. Mr. Wilkinson observed, that iron at this time occupied the attention of scientific men of every country. That to the chemist and philosopher it presented many anomalies; that it was, as it were, a problem they had hitherto been unable to solve. That its chemical and electrical properties were at variance with all preconceived ideas. That it appears to possess some extraordinary relation to other bodies, which, whenever it may be satisfactorily explained, will open an extensive field of scientific inquiry, and prepare the way for the most important discoveries, and that it must be universally acknowledged iron is the most valuable and important metal with which we are acquainted. He descanted on the influence of electricity, and observed that iron was a metal well known to exhibit, in the most striking manner, the phenomena of that science in the form termed magnetism; and that it always appeared to him that the different states of iron and steel depend on electrical causes, modified by the action of carbon and oxygen. He then entered into the usual method of manufacturing iron in Europe, next described steel, when first prepared, as being only suitable for common purposes, and which, from its appearance, was called *blistered steel*. He exhibited a specimen in its relaxed, and also one in its brittle state. In the course of Mr. Wilkinson's interesting and instructive lecture, the minutiae of which our space will not allow us to detail, he made several amusing experiments. He explained the nature of shot after having been under water for more than two or three hundred years, becoming almost red-hot when recovered and exposed to the air. He also shewed the varying attraction of the poker to the needle, and the effect of ignition by a tube of glass being filled with metallic lead, hermetically sealed, and when the opposition to air was removed, the contents being sprinkled over a sheet of paper, setting fire to it; inferring, and very correctly, that if iron, which had been under water during a course of years, could be reduced to such small, such fine particles, it would have the same effect. Mr. Wilkinson concluded the illustration by giving many extraordinary instances of the effects produced on iron by the long-continued action of salt water, and exhibited several specimens of iron which had been recovered after having been immersed in the ocean for years.—Mr. Cornelius Varley attended, and exhibited living specimens of the animalculæ referred to by Mr. Wilkinson in the early part of his

lecture.—In the Mabel Room were exhibited those models representing the subjects which have so recently been rewarded, and which we noticed in our last.

On Wednesday evening the Society closed the present session: except the election of Prince Albert, who was nominated as a member by his royal highness the President on the day of the distribution of rewards, and which we hail as a happy omen to the Institution, nothing particular occurred.

#### ROYAL GEOGRAPHICAL SOCIETY.

JUNE 8. Mr. Greenough, President, in the chair.—The papers announced as received since the last meeting were:—1. 'Mr. Ainsworth's Route from Constantinople, by Aleppo, to Mosul.'—2. Professor Rafinesque 'On the Physical Geography of North America, and on the Sites for New Colonies.'—3. Dr. Brimmet 'On the Saltiness of the Dead Sea.'—4. Lieutenant Newbold 'On the Ruins of Mahabalipuram, &c. on the Coast of Coromandel.'—5. Professor Chaix 'On the Heights of Places in Switzerland.' The following extracts were read:—1. A Letter from Mr. Vulliamy, presenting a Clock to the Society for the use of its library.—2. From Sir John Franklin at Van Diemen's Land, 21st February, 1840, stating that the French expedition, under Captains Dumont d'Urville and Jaquiot, had just returned from their second trip to the Antarctic Seas, where they had discovered land, which was traced for 150 miles between the latitudes of 66° and 67° south, and the longitudes of 136° and 142° east. A party went on shore in 66°40, and procured a specimen of the rock. The general surface of the land was covered with frozen snow and ice, and there were no traces of vegetation: its mean height is about 1300 feet. M. d'Urville named it *Terre Adèle*. In tracing its shore westward, he was stopped by the ice stretching from the shore as far north as could be seen from the mast-head. As they were threading their way along the ice the ships were caught by a violent gale, and in great danger. On the wind becoming moderate, they again attempted, though ineffectually, to get at the land. In subsequently proceeding along the ice to the west, the ships passed along a barrier of ice, steep, solid, and compact, 150 feet high, which M. d'Urville thinks is based on land, and therefore, named it *Côte Claire*.—3. An Account of the Examination of the Indus, from Haider-abad to Attak; and Journey to the Sources of the River Oxus, in the high plateau of Pamir, in Central Asia, by Lieutenant Wood, Indian Navy. "The mission to Kábul under Sir A. Burnes, which I accompanied," said Lieutenant Wood, "left Bombay on the 28th November, 1836; and from the beginning of December of that year till August 1837, my attention was solely directed to the examination of the Indus. Commencing at Yhat'hah, at the head of the Delta, up to which point the examination was carried on by Lieutenant Carless, I.N., the river was sounded the whole way up to Mitunkot, at the junction of the Chenáb; and again from this spot up to Kala-bagh, a town on the western bank of the Indus, at its outlet from the mountainous region. The great increase of difficulties between this place and Attak, a distance of about seventy miles, obliged me to abandon the ascent after, by dint of warping, having accomplished twenty-four miles; and I went by land to Attak, whence we descended the stream to Kala-bagh. The passage was fearful enough in some places,—steep mural banks between which the river rushed

at the rate of nine miles an hour, and at other times dashing between ledges of rocks, the channel changing from one side of the river to the other. The mean breadth of the river from Kala-bagh to the Delta is about 700 yards at its lowest, but, when swollen, it varies occasionally from four to five miles. To enter into the details of a nautical examination of a river, comprising a distance of 1100 miles, would be here quite out of place; but my charts now exhibited on the scale of two miles to an inch, shewing the numerous mud-banks and the soundings, will give a better idea of its capabilities for navigation than any description. The result, I regret to say, is not so favourable as was anticipated; for after the most ample opportunities of judging, and having seen the river both when low and swollen, the *Indus was found only navigable for steam-vessels of thirty inches draught*; and it yet remains to be seen, which repeated trials alone can prove, how far it is usefully navigable for *steamers* of even this light draught of water. To remedy the defects of this river-navigation, in a commercial point of view, fairs should be established at well-selected places along its banks, where the merchant might deposit his goods to be exchanged for the raw products of the regions to the westward. Until very lately the countries on the right bank of the Indus, from its mouth to Attak, a distance of 1200 miles, embracing the whole of Afghanistan, and the rich alluvial tract bordering the stream, have had no available outlet for their productions. This is no longer the case; but, until trading emporia are established on the river, it cannot be said to be usefully open; the more we drain this country of its raw produce, the greater quantity of manufactured articles will its inhabitants receive in return. And why should not the Indigo, the sugar, the tobacco, and cotton of the Indus, equal that grown on the banks of its sister-stream the Ganges? The quantity of these articles which Sindh alone is capable of yielding is almost unlimited; but the staple of the Indus is wool, a branch of commerce which has sprung up within the last five years, and holds out every prospect of very valuable returns. No sooner do we ascend above the alluvial basin of the Indus than we come to inexhaustible supplies of rock-salt, alum, and sulphur. Coal has also been discovered at different places in the neighbourhood of Kala-bagh, but though of good quality it is doubtful whether its thin strata would repay the expense of working it. I will not further enlarge upon this part of the survey, but refer to my narrative, which is in the hands of the publisher, for the details and facts upon which the above results are founded. From Kalabagh, I travelled by Kohat to Peshawur, and eventually to Kábul, whence I was sent to map the adjacent province of Koh Damun, from which I was soon recalled to accompany Dr. Lord into Tartary. On starting, we attempted to penetrate, by a route new to Europeans, the pass of Siri-Jung; but the season was too far advanced, and after being all nearly lost in the snow returned to Kábul, and thence proceeded by the Bamian pass, which traverses a height of 12,000 feet, and is the western pass through the Hindú Kúsh from Afghanistan. We had a *carte blanche* from Sir Alexander Burnes, who, with his well-known zeal for geography, was not wanting in stimulating us to make the best use of the opportunity now afforded us. Travelling by Rohat and Baghlan, we reached Khundúz on the 4th December, 1837; and Dr. Lord having obtained from Murad Bey permission for me to

trace the Oxus, I started on the 11th on this interesting journey. Our party consisted of two Afghans, two Kábulis, one Sindhmunshi, and myself: we travelled in an easterly direction along the banks of the river of Khanahi-bád by Talikhan to the pass of Lattarband, 3900 feet above the sea, where we entered Badakshan. To the right of the pass the remarkable pinnacle of Takhti-Suleiman towers 2000 feet higher; while to the left or north-west the cone of Koh-Umber, covered with luxuriant vegetation, rises 2500 feet above the village of Khundúz. Descending through a rugged country, and crossing several streams, 60 miles in an E.N.E. direction, brought us to the river of Faizabád, once the capital of this district, lying on the northern bank of the Kokcha river at an elevation of 3600 feet above the sea. We were here delayed a month by the severity of the season, the thermometer falling by night below zero of Fahrenheit, and by unfavourable accounts of the roads; but I had ample employment in making vocabularies of the five different dialects spoken in Badakshan. I also visited the mines of Lapis lazuli, lying about forty miles to the south, on the skirts of Hindú Kush at 8700 feet above the sea; and made an attempt to reach the celebrated ruby mines, which are situate on the northern bank of the Amú or Oxus, but ice and snow debarred our access. Yet with all this the month was a weary one; and on the 31st January, 1838, I gladly set forward on the original object of my expedition. Following the Oxus in an easterly direction we ascended the pass of Ishkashm, 10,900 feet above the sea, and entered the valley of Wakhan, well known to all readers of Marco Polo's journey, and were here fortunate enough to meet with a horde of that singular people the Kirghiz, from Pamir, who, for the first time, had come down to pass the winter in Wakhan, instead of descending the plateau to Kokan. Nor were the natives of the valley of less interest than these strangers, since all the rulers around professed to be the descendants of Alexander the Great; and I may add that in these secluded regions, faint, but marked, traces of Zoroaster's creed may still be found, and the ruins of three fire-temples ascribed to his followers. Continuing our journey to the E.N.E., up the valley of Wakhan, and along the southern bank of the river, here called Panja, probably from five castles which occur in the valley, we forded it at a spot where it was only twenty yards wide and three feet deep, at an elevation of 10,800 feet; and on the 15th February reached Langer Kish, a village of twenty-five huts, and the last inhabited place in the valley; it is situated at the junction of the Sirhad river (which here comes from the Chitral country to the south-east) with the Amú. After carefully examining this stream to assure myself which was the larger, I had no hesitation in deciding that the north-eastern branch was the main river, and in this all the Kirghis and my guides agreed. Following the stream in its upward course, sometimes on its frozen surface, at others along its narrow snow-blocked valley, with rugged mountains rising on either hand, we found great difficulty in advancing, as at every step the snow lay deeper and deeper. Each horse of the party by turns took the lead, and struggled onward till it sunk under exhaustion, and was allowed to lie in the snow to recruit its strength. Had we not been able to travel on the frozen surface of the river, we should not have reached its sources, so thick was the snow in the valley. Since leaving

Wakhan, my thermometer, which was only graduated down to  $+6^{\circ}$  of Fahrenheit, had become useless; the mercury had sunk into the bulb; but the extreme cold and the highly rarefied state of the atmosphere were very sensibly felt; no exertion could be continued, and all complained of great oppression, but no nausea, as is said to be experienced at great altitudes. As we neared the head-waters of the Oxus, the ice became weak and brittle; and on one occasion one of our yabús, or ponies, disappeared through the ice; but though the water was deep there was little current, and the poor animal was extricated with only the loss of his load; the kind manner in which the owner watched the recovery of the pony from its severe ducking, could not have been exceeded had it been his child instead of his yabú. After quitting the surface of the river, we travelled about an hour along its right bank, and then ascended a low hill, that apparently bounded the valley to the eastward; on surmounting which, at five o'clock in the afternoon of the 19th February, 1838, we stood (to use the native expression) upon the Bami-Dúniáh, or "roof of the world," while before us lay stretched a noble but frozen sheet of water, from whose western side issued the infant river Oxus. This fine lake lies in the form of a crescent, about fourteen miles long from east to west, by an average breadth of one mile. On three sides it is bordered by swelling hills about 500 feet high, which along its southern bank rise into mountains 3500 feet above the lake, or 19,000 feet above the sea, and covered with perpetual snow; from which never-failing source the lake is supplied. From observations at the western end, we found the latitude to be  $37^{\circ} 27'$  by meridian altitude of the sun, and longitude  $73^{\circ} 40'$  east; its elevation by the temperature of boiling water is 15,600 feet, as my thermometer marked  $184^{\circ}$  of Fahrenheit; the temperature of the water below the ice was at  $32^{\circ}$ , or freezing point. This, then, is the position of the sources of this celebrated river, which after a course of upwards of a thousand miles in a general northwestern direction, falls into the southern end of the sea of Aral. As I had the good fortune to be the first European who, in later times, had succeeded in reaching the sources of this river, and as shortly before setting out on my journey we had just received the news of her gracious majesty's accession to the throne, I was much tempted to apply the name of Victoria to this newly discovered lake: but, on consideration that by thus introducing a new name, however honoured, into our maps, great confusion in geography is likely to arise, it is better, perhaps, to retain the name of Seri-kol, as this lake was called by our guides; and have only to add that, the description of this spot by Marco Polo was found to be so correct that I might almost have translated the account as given by that good old traveller nearly six centuries ago."

Mr. Wood's paper was illustrated by a map of his route up the valley of the Oxus; by a section shewing the height of the land passed over; and by five charts, on a large scale, shewing the survey of the Indus from Atak, in latitude  $34^{\circ}$  north, down to Mittun-Kotat its junction with the Chináb.

#### ROYAL INSTITUTION.

FRIDAY, June 5. — The Rev. Dr. Scoresby, 'On Magnetism,' gave the results of his personal investigations, and the improvements, thence derived, in magnetical instruments and apparatus. His object has been to produce in

steel a higher degree of magnetic energy, and to give to such energy tenacity or permanency. The compound compass-needle, consisting of several steel bars tempered throughout, was fully described and exhibited to the British Association at Bristol, in 1836; and in the spring of last year, Dr. Scoresby published his subsequent researches and experience. Of this publication we have recorded our favourable opinion. The most efficient and highly susceptible compass-needle recent investigations have led him to adopt, is a combination of two bars only. The great superiority of this instrument, spaced, and tempered throughout, over the ordinary compass-needles, which he had obtained as the best from the naval stores, was clearly exhibited. Our naval readers will fully appreciate the advantage of a compass-needle with sufficient weight to ensure accuracy in the roughest weather, and with magnetic energy to render it highly susceptible to the slightest deviation. The dangers from the sluggish compass thus removed, will also be a boon to the underwriters. The preservation of our fellow-creatures in their several hazardous pursuits is worthy the highest praise, and that man is to be envied who suggests means to that end. The improvement of the compass-needle tends to this; as also does the application of magnetism to civil engineering. Dr. Scoresby recommends the use of the magnet and needle in tunnelling to ascertain the distance of the headways. The present method, by blast, is attended with considerable danger. In the case of Liverpool two poor fellows narrowly escaped death. The blast went through, but fortunately they were so near that the rocks spread on either side of them, and they lost each an eye by the explosion of the gunpowder. We need not describe the method of their use. It will be evident to slight consideration, and is a further proof of how simple every thing becomes when known. It is only necessary to state that their efficiency depends upon the transparency, which Dr. Scoresby has proved, of all substances to magnetic agency. No body, not even iron, except inasmuch as its magnetic condition be increased or diminished, offers resistance to the magnetic energy. The whole of the observations and results made and detailed by Dr. Scoresby were replete with interest and value. — At the conclusion of the illustration a powerful magnet was exhibited. It was constructed of 196 steel plates as hard as glass, such as are used for buxks, arranged in two bundles. Its capability to induce magnetism was very great. A large key, held from four to five inches distant, supported more than its own weight. This power of induction is truly wonderful, as indeed is every operation of the "Imponderable Agents." A novel effect shewn attracted great attention. From 6 to 7000 brads or nails, sometimes also called sprigs, were taken up and held by the magnet, and presented a metallic mass, but plastic like an amalgam, to be moulded into any form; spread out, or drawn rope-like, it yielded to the hand, and remained in the shape the moulder desired. But the proofs brought forward were numerous, that something has been done to obtain increase of power in the magnet.

#### BOTANICAL SOCIETY.

FRIDAY, 5th June. Dr. Macreight, V.P., in the chair. — Exhibited by Mr. Holman, living specimens of *Osmunda regalis*, *Acrostichum anthrophora*, *Ophrys muscifera*, and of other plants from Reigate, Surrey. — Announced, a large collection of plants received from North Ame-

rica, also an extensive present of books from various members. — Read, part the third of a 'Monograph on the Ferns,' by Mrs. Riley. The former parts contained observations upon the genera of the British ferns; the present one remarks upon the species with a view to elucidate the descriptions given by Smith in his fourth volume of the "English Flora." The remarks are the result of the fair botanist's personal observation, and are highly creditable and valuable. Nearly fifty species are minutely described, and their similarities and differences pointed out. Grown side by side, Mrs. Riley has been enabled to trace the characteristic differences; and her remarks will doubtless set at rest opposite opinions as to the generic distinction and the number of species of this interesting family. We give a specimen of a remark on *Cistopteris* to enable our readers to judge of the value to be attached to Mrs. Riley as an authority. Even this spring Mrs. Riley had traced a fresh distinction between *dentata* and *angustata*, for while *C. dentata* has already early in April unfolded its fronds, *C. angustata*, in the same situation, is not out of the ground. The greatest resemblance occurs between *C. angustata* and *C. fragilis*; but the habit, colour, setting on of the pinnae, the situation and number of sori, prevent her blending them together. Hooker and Sir J. E. Smith, it will be remembered by botanists, are at variance on this very species.

#### PARIS LETTER.

Academy of Sciences, June 9, 1840.

SITTING of June 1. — M. Boquillon and Count Demidoff sent to the Academy some remarkable specimens of electrotypography, and of galvanoplastic products, the former made at Paris, the latter at St. Petersburg by Professor Jacobi. M. Boquillon's specimens consisted of copperplate engravings, reproduced by the voltaic pile, and from which some good impressions had been struck off. The Professor's were some copper casts of wooden sculptures of the Albert Durer school. It was mentioned from M. Jacobi, that he found it of importance to cover the models well with a coat of graphite before commencing operations. — A message was brought to the Academy from government, requesting that it would draw up as speedily as possible a report (asked for long since), 'On the Nutritive Qualities of Pure Gelatine, as extracted from Bones, &c. by Steam in Cylindrical Condensers.' The object was to learn whether this substance might be administered unmixed to patients in hospitals, or whether it required to be diluted with soup, as at present done in those institutions. The Academy instructed M. Magendie to report immediately. — M. Dumas read a report on M. Selliques' method of extracting bituminous oils and other products from certain schistose rocks, and applying these products to the furnishing gas for lighting. The principal rocks worked by M. Selliques, the report stated, were at St. Léger-Igornay, and Surmoulins, near Epinal and Autun, in the Saône et Loire: three manufactories were established there, and produced 2000 kilogrammes of bituminous oil a-day. The total number of various products extracted from the rocks, and serviceable for gas, were five; besides these there was a bituminous matter, applicable instead of grease to the wheels of carriages; another was good for all purposes of bituminous paving, &c.; another substance was found to suffice as a vehicle in the composition of dark-coloured varnish; and, last of all, a white waxy matter

was extracted, which had been formed into tapers, and made a good kind of candle. The strata of these bituminous slates were found to yield from 10 to 50 per cent of oily substances, more or less combustible; but the gas was produced only from the oil in its purest form. It had been discovered by M. Selliques that carbonic acid gas was endowed with great combustibility when mixed with other gases—a fact generally doubted; and it had also been found that a gas, yielding a very bright light, was formed by mixing the gases coming from the bituminous oils with those resulting from the decomposition of water. This latter kind of mixed gas was produced very cheaply, and was not affected by cold at fifty degrees below zero, centigrade. Dijon, and the suburb of Paris called Les Batignolles, were already in great part lighted with gas made according to M. Selliques' plan; the results in each case being extremely satisfactory.—M. Cauchy read a report on a memoir by M. Duhamel, 'On the Action of the Bow on Violin Strings.' The question was examined on the supposition of the velocity of the bow remaining constant for an indefinitely small portion of time.—Dr. J. Guerin communicated a curious case of cure of the luxation of the second cervical vertebra, after seven months had elapsed from the fall by which the distortion had been produced. The patient was a young female, and from the danger of affecting the spinal marrow by the operation, it was necessary to affect the cure without touching the medullary column. This was effected by the sub-cutaneous section of the muscles, from which the vertebra, finding itself exposed without any counterpoise to strong and incessant muscular traction, returned to its natural position.—Much valuable time of this sitting was occupied with the reading of a note by M. de Pontécoulant, on certain errors of calculation in his astronomical work "Analyse du Système du Monde," which he attributed to M. E. Bouvard of the Observatory, who had been employed to make the calculations for him. M. Bouvard in reply shewed that his calculations were correct, but that M. de Pontécoulant had given him wrong formulæ to work by, and with the rectification of which he had nothing to do. An angry discussion ensued, being an episode of the quarrel between M. de Pontécoulant and M. Arago.

At the last sitting of the Academy of Inscriptions, the Greek Archbishop of Tripoli, and the Catholic Bishop of Babylon, who resides at Bagdad, were present.

*Royal Academy of Sciences and Belles Lettres of Toulouse.*—In the sitting of April 9, M. François, of the Engineer corps, read a memoir on the ferruginous mud and the ariferous sands of the Ariège and the Haute Garonne. The presence of the former mineral he attributed to the decomposition of pyritiferous rocks bordering on the granitic and igneous rocks. Some of the ferruginous muds were also much charged with manganese, giving as much as eighteen per cent of this metal. He also thought that the thin plates of gold found in the sands of the above-mentioned rivers came from the decomposition of pyrites.

The *Société du Muséum d'Histoire Naturelle* of Strasburg has published the first number of the third volume of its "Mémoires." This work contains an interesting article on the botany of the Rhine, by Professor Kirschleger; and another on the botany of the environs of Strasburg, by M. Steinheil. Some good articles on foreign mammiferous animals are also comprised in it.

*Sciara da.*  
Primo, Liberator d'un popolo.  
Secondo, l'fui crudel, spietato.  
Intero, Più di un sì è immortalato  
Valendosi di me.  
Answer to the last:—Po-vero.

### LITERARY AND LEARNED.

#### UNIVERSITY INTELLIGENCE.

CAMBRIDGE, June 4.—The following degrees were conferred:—

*Doctor in Physic.*—G. Budd, Fellow of Caius College.  
*Masters of Arts.*—F. J. Benson, J. C. Browne, J. G. Ramaden, G. Gardiner, St. John's College; W. J. Partidge, Corpus Christi College; A. Riggs, Christ's College.  
*Bachelor in the Civil Law.*—C. Sladen, Trinity Hall.  
*Bachelor in Physic.*—S. W. Turner, Queen's College.  
*Bachelors of Arts.*—A. B. Strettell, Trinity College; C. R. Bradley, Queen's College; E. K. Luscombe, Trinity Hall.

### LITERARY AND SCIENTIFIC MEETINGS

#### FOR THE ENSUING WEEK.

*Monday.*—Statistical, 8 P.M.; British Architects, 8 P.M.; United Service, 9 P.M.  
*Tuesday.*—Linnean, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.  
*Thursday.*—Royal, 8 P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Saturday.*—Asiatic, 2 P.M.

### FINE ARTS.

#### BRITISH INSTITUTION.

THE Gallery of this Institution was reopened to the public on Mondaylast. "The Directors of the British Institution," says a notice prefixed to the Catalogue, "have been enabled, by the liberality and kindness of the proprietors, to collect for their Second Exhibition some fine works of the ancient masters, that have never been exhibited on any former occasion. Some few of singular merit appear for a second time, but it is after a lapse of several years. The Directors have this year made an alteration in the usual plan, and have dedicated one room entirely to the reception of the works of Mr. Hilton, the late Keeper of the Royal Academy. His merit is too well known, and his character too highly appreciated, to render it necessary to say one word on the subject. They flatter themselves that the public will be gratified with an Exhibition that will at the same time do credit to the memory of the artist."

The Directors are perfectly right in believing that the public will be gratified in viewing the fine collection here exhibited of Mr. Hilton's works; although that gratification must be damped by the consideration that the skillful hand which produced them is now cold in the grave, and still more by the reflection that the merits of that highly-gifted and amiable artist do not seem to have been adequately appreciated, during his life, by the patrons of art. Somewhat of this neglect may, perhaps, be attributed to Mr. Hilton's modest and retiring character: a sorry apology, however, for those whose duty and whose privilege it is to seek for genius in its seclusion, and to use the power and influence with which the possession of rank and affluence invests them, to secure for it the rewards to which it is justly entitled.

This annual and supplementary Exhibition is one which, for obvious reasons, we have always held to be sacred from criticism; but we cannot refrain from observing that, great as are our admiration and deference for the *chefs-d'œuvre* of the old masters, we feel infinite satisfaction at seeing the productions of Reynolds, Gainsborough, Wilson, Zoffaniii, and Hilton, occupying so large a space on the walls, and doing so much honour to the English school. We will now, as on former occasions, simply indicate a few of these admirable works which most strongly attracted our attention, viz.

1. *Mount Parnassus.* Claude. — 2. *Christ*

*Bearing the Cross, and Santa Veronica.* A. Caracci. — 13. *The Magdalen at Devotion.* Guercino. — 20. *A Forest Scene.* Hobbima. — 22. *A Forest Scene.* Hobbima. — 25. *The Magdalen.* Titian. — 27. *Mater Dolorosa.* Carlo Dolce. — 28. *The Holy Family and St. Catherine.* Old Palma. — 38. *A Lady, Washing her Hands.* Egdon Vander Neer. — 56. *Landscape, with Figures.* Gaspar Poussin. — 60. *A Repose.* Murillo. — 64. *A River Scene on the Coast of Holland.* Ruysdael. — 73. *The Shepherds' Offering.* Lud. Caracci. — 80. *Footstool in the Character of Major Sturgeon.* Zoffaniii. — 81. *Garrick in the Character of Abel Druggier.* Zoffaniii. — 82. *Footstool and Weston in the Characters of Dr. Last and the President.* Zoffaniii. — 83. *Cupid as a Pickpocket.* Sir J. Reynolds. — 85. *Cupid as a Link Boy.* Sir J. Reynolds. — 84. *Landscape, with Buildings and Portraits of George IV. and the Princess Royal when Children.* Gainsborough. — 86. *The Annunciation.* Rubens. — 95. *Landscape, with Meleager and Atalanta.* R. Wilson. — 96. *View of Whitehall.* Canaletto. — 111. *Joshua Conducting the Ark over the River Jordan.* N. Poussin. — 122. *The Student.* Sir J. Reynolds. — 126. *The Port of Amsterdam.* Storck.

Of the sixty-seven pictures by the late William Hilton, Esq. R.A., our favourites are, — 132. *The Entombment of Christ*; 152. *The Triumph of Amphitrite*; 156. *Jacob Parting with Benjamin*; 158. *The Angel Releasing Peter from Prison*; 160. *Rebecca at the Well*; 176. *Edith and Monks Discovering the Body of Harold*; 182. *Sabrina Releasing the Lady from the Enchanted Chair, a Sketch*; 191. *Sir Calpine Rescuing Serena*; 193. *The Rape of Europa*; 197. *An unfinished Study of a Nymph.*

It is but justice to add the names of the noblemen and gentlemen who, by their several contributions, have favoured the public with this rich treat of art:—

The Duke of Norfolk, K.G., the Duke of Buccleuch, K.G., the Duke of Sutherland, the Marquess of Westminster, the Earl of Carlisle, Earl de la Warr, the Earl of Burlington, the Earl of Lichfield, the Earl of Normanton, Viscount Duncannon, Viscount Powerscourt, M.P., Viscountess Anson, Lord Feversham, Lord Ashburton, Lord Colborne, Hon. W. T. Fox Strangways, Right Hon. Sir Robert Peel, Bart. M.P., Sir John Swinburne, Bart., Sir Thomas Baring, Bart. (thirty-seven pictures!), Sir Charles Sullivan, Bart., Sir George Philips, Bart., John Allnutt, Esq., Joseph Barchard, Esq., D. Barclay, Esq., C. O. Bowles, Esq., Charles Brind, Esq., Henry Broadwood, Esq. M.P., George Byng, Esq. M.P., Rev. J. Coles, Dr. Darling, P. Dewint, Esq. Executor of the late Mr. Hilton, Andrew Drummond, Esq., Richard Elison, Esq., W. Evans, Esq., Andrew Fontaine, Esq., the Rev. Thomas Gronow, Thomas Hamlet, Esq., John Hardwick, Esq., John Heathcote, Esq., Charles Heusch, Esq., R. S. Holford, Esq., H. T. Hope, Esq. M.P., H. A. J. Munro, Esq., Dr. Nevinston, William Parker, Esq., Newman Smith, Esq., William Smyth, Esq., Lieutenant-General Thornton, J. H. Turner, Esq., Robert Vernon, Esq., Charles Baring Wall, Esq. M.P., William Wells, Esq., S. C. Weston, Esq., George Wilbraham, Esq. M.P., Colonel Wyndham, the Executors of the late Mr. Carr.

### ROYAL ACADEMY.

[Concluding notice.]

THE Architectural Room has its full complement of halls, mansions, and other structures, designed or in progress; but of their characters, accompaniments, or proportions, we pre-

tend not to judge further than as regards their pictorial appearance. There are also some, which, from the extraordinary qualities with which they are invested, must attract admiration whenever they are seen. Of this class is 984. *La Sala del Tribunal; or, the Hall of Judgment in the Palace of the Alhambra*. O. Jones, the figures by L. Haghe.—While we wonder at the skill and patience of the artist, who, with such correctness and labour, has given a faithful character of the ornaments which decorate the walls of the building, we feel that such a profusion of decoration is injurious to architectural grandeur and repose. This is more strikingly evinced by the contrast which is afforded by 944. *Remains of the Portico of the Lesser Temple at Baalbec*. D. Roberts, A.—There is a magnificence and purity in this performance that eclipses almost every thing by which it is surrounded. 1009. *The Trial of Rebecca in the Hall of the Knights Templars, &c. &c.* G. P. Jenner.—If this is meant for a display of architecture, the purpose seems to us to be defeated by the scattered groups that fill the court, and with little apparent interest in what is going on: it is, however, a work of magnitude and labour, and exhibits capabilities that on a future occasion may shew to more advantage. 972. *Restoration of the North Front of Crosby Hall, as it is supposed to have existed in the year 1600*. J. Davies.—Such designs more naturally fall in with the taste of the present day; a taste which we repeat we are glad to see prevalent. 1016. *A Vision of the Nineteenth Century; the Portico of the National Gallery in the Foreground*. J. Goldcut.—The last two articles relate, the one to the past, the other to the future; nor can we see any good reason why an artist should not exercise his fancy in such retrospections and anticipations: at all events, each of them exhibits a powerful imagination and a lively scene. We have now given a sprinkling of the architectural subjects. In the same room are some beautiful medallion works by B. Wyon, B. Pistrucci, A. J. Stothard, the late W. Pitts, &c. &c.

We now descend to the Sculpture Room, "although the last, not least," in our consideration. In the present Exhibition, it takes a more than usually high rank. The works of Chantrey occupy a much greater space than of late years.

1070. *Bust, in Marble, of her Majesty Queen Victoria*. Sir F. Chantrey, R.A.—We scarcely know a more difficult task than to execute the resemblance in marble of any crowned head; and when the royal personage is also fair and young, we need hardly say that the difficulty is greatly increased. Expression, beyond that which is exalted and sedate, it is not safe to venture upon; and we congratulate Sir Francis on effecting a strong resemblance, and at the same time preserving the dignity of the queen.

1074. *Statue in Marble of James Northcote, Esq. R.A.* Sir F. Chantrey, R.A.—Those who remember the intellectual features and intelligent look of the late venerated artist may see them perpetuated in this truly characteristic portrait.

1104. *Statue in Marble: part of a Monument to be erected in the Church at Pethoor, to the Memory of the late Earl of Egremont*. E. H. Baily, R.A.—We cannot but consider a character like this, spreading sunshine through the ranks of art, as best likened to the attribute of mercy—"it is twice blessed:" and we think the sculptor must feel no small gratification in being called upon to exercise his talent in the personification of so much kindness and

benevolence. It is Genius reflecting its beams on Patronage.

1105. *A Marble Statue of the Wounded Amazon*. J. Gibson, R.A.—However graceful in form or attitude, we must own ourselves such mere Goths, that we have no sympathy for fighting females; and that we turn with infinite delight to 1076. *Statue of a Girl going to Bathe*, P. Mac Dowell; a performance full of just proportion and elegance.

1100. *Statue in Marble of the late William Wilberforce, Esq., to be erected in Westminster Abbey*. S. Joseph.—The shadow of this good man's fame, like that of the sun, lengthens as its cause retires. To the form ennobled by so rich a mind, the artist has given an expression which once seen can never be forgotten. The features exhibit strong excitement under the most powerful energy of thought.

1071. *Statue in Marble of William Roscoe, Esq., of Liverpool*. Sir F. Chantrey, R.A.—We know not its particular destination, but this we do know, that an effigy of such a man and by such an artist deserves a high and honourable place: for the more it is seen, the further must its moral, literary, and scientific influence extend.

1079. *The Creation of Adam*. W. C. Marshall.—Such formations in the attempt at representing them may well task the utmost powers of the artist. It is not in a short survey that justice can be done on a work like this; still we are prepared to say, according to our judgment, the artist has acquitted himself most creditably.

1080. *Henry the Eighth; 1095. Cardinal Wolsey: parts of a series executing in Caen Stone, for Mamhead, the Seat of Sir Robert Newiman, Bart.* C. Smith.—Belonging as they do to so striking a portion of our history, these fine works cannot fail to excite interest, especially recommended as they are by the talents of so able an artist.

1092. *Marble Statue of Field-Marshal his Grace the Duke of Wellington, K.B.* J. E. Thomas.—No recurrence, however frequent, can make the resemblance of the noble warrior too familiar to the friends and well-wishers of their country.

1072. *Winter, a Statue in Marble; being one of a Series now Executing by order of the Goldsmiths' Company, for the Grand Staircase of their Hall*. S. Nixon.—To such a place, on most occasions, an appropriate figure; and the more so, as it conveys no idea of old age or decrepitude, but rather awakens associations of comfort, and of the festivity connected with the season.

1099. *Ino and the Infant Bacchus*. J. H. Foley.—This is a summer subject, graceful in form and playful in character, fitted either for hall or bower: perhaps more properly for the last. A garden scene, together with the gay groups of Watteau's pencil, would be in perfect accordance with it.

1096. *A Roman Fruit-Girl*. T. G. Lough.—Recommended by its taste and elegance such, a figure might be advantageously placed any where.

Among the busts we especially noticed:—1077. *D. MacIose, Esq. R.A. Elect.* E. Davis.—1123. *W. C. Ross, Esq. A.R.A.* E. W. Wyon.—1128. *Dr. Dalton*. H. Cardwell.—1134. *Viscount Strathallan*. L. Macdonald.—1147. *Viscountess Middleton*. H. Weeks.—1148. *Alderman Venables*. W. Behnes.—1160. *The Rev. H. Dudley Ryder*. T. Butler.—1165. *John Black, Esq.* P. Park.—1173. *A Lady*. W. Behnes.—1174. *The late Philip Rundell,*

*Esq. E. H. Baily, R.A.*—1171. *John Burnett, Esq. F.R.S.* J. Fillans.—1178. *Thomas Clarkson, A.M.* W. Behnes.—1179. *The late Henry Earl, Esq.* W. Behnes.—1193. *Sir Richard Bourke, K.C.B., late Governor of New South Wales*. E. H. Baily, R.A.—1197. *Lady Chatterton*. R. Westmacott, A.—1198. *The Rev. Dr. Mill, late Principal of Bishops' College, and Vice-President of the Asiatic Society of Bengal*. Sir F. Chantrey, R.A.—1199. *Sir Charles M. Clarke, Bart. M.D.* Sir F. Chantrey, R.A.—1088. *John Lander, the African Traveller*. Mrs. Thornycroft, late Miss Francis.

#### NEW PUBLICATION.

*Portrait of His Royal Highness Prince Albert.* Painted by George Patten, A.R.A.; Engraved by C. E. Wagstaff. Hodgson and Graves.

EVERY loyal and patriotic man must feel gratified at the "golden opinions" which this illustrious prince, since his arrival in England, has not "bought," but won, "from all sorts of people." If there be, as, in the present instance at least, we firmly believe there is, "an art to find the mind's construction in the face," the cause of his royal highness's increasing popularity is apparent in the countenance of the clever and strikingly pleasing print under our notice, which expresses a mingled intelligence, kindness, and ingenuousness, that cannot fail to command universal respect and attachment.

#### THE DRAMA.

*Mr. Dowton's Benefit* on Monday was fully attended, and presented a spectacle of great dramatic interest. The play of *The Poor Gentleman*, in which the veteran took his leave, was succeeded by a feeling address, written and spoken by Mr. Sheridan Knowles; and the evening concluded with a musical entertainment and a farce. The feelings of the audience were much affected, and it really appeared as if many of the performers were not actors in the expression of their emotions towards their old companion, now bidding them and the public his parting farewell. We trust the amount will be commensurate to the benevolent object the patrons of this benefit had in view.

The *English Opera House*, on Tuesday, commenced a summer season, upon a principle which strongly appeals to public feeling; whilst, we rejoice to add, it is supported by a company whose talents equally entitle them to public favour. The performers have united to try their fortune in this undertaking; and when we consider how many of them are of first-rate ability, and have by the circumstances of dramatic speculation been deprived of the usual means of exercising their profession, we must earnestly wish them every success in their enterprise. The list of names is very attractive:—Mrs. W. Lacy, Mrs. Orger, Mrs. Brougham, Miss Cooper, Mrs. R. Romer, Madame Simon, Miss Smithson, Miss Fitzjames, Mrs. Reede, and Miss Bartlett, forming the female phalanx; and J. Green, Brougham, Compton, G. Wild, Baker, Binge, Fitzjames, Addison, Granby, Turnour, R. Romer, S. Smith, Kerridge, and Lewis, making up its male strength. As far as they have yet gone, the performances have been very successful; and though, as elsewhere hinted, we cannot this week enter into the details, we may say that *A Match in the Dark*, a second part of the burlesque of *Tom Thumb*, and a melodrama called *Helen Oakeleigh*, have been much applauded by good houses.

**French Plays.**—On Wednesday Mr. Cloup, opened the Olympic Theatre for French plays, with a smart company. The performances exhibited much talent.

**Concerts d'Eté.**—Under this title Mr. Eliason has commenced a series of musical nights at Drury Lane Theatre; and we rejoice to say the undertaking has been patronised by the public, and the house filled every night. We have not this week been able to attend as punctually as usual to the dramatic novelties brought forward, and must, therefore, defer the particular notice of these entertainments: suffice it to say, that they justify the very high opinion which Mr. Eliason's previous exertions have earned for him in the musical world; and for excellent selection, taste, spirit, combination, and general execution, are treats of an order such as we have not hitherto been accustomed to in English theatres. The house is beautifully fitted up.

**Blagrove's Concert.** on Wednesday, went off with great éclat. Litolf's piano and his own violin were delightful enough to sustain a whole morning's musical entertainment; but we had also the vocal beauties of Clara Novello, Dorus-Gras, and others; and an instrumented piece of Beethoven, with thirty-six instruments, the effects of which combined almost every charm from simple melody to sublime harmony.

#### VARIETIES.

**H. B., Nos. 641, 42, 43.**—Another trio of caricatures. The first, "Robinson Crusoe and Friday;" but we do not recognise either the artist's humour or likenesses in the application, said to be Lord Howick (the best of the two) and Mr. Wood. The next is another version of the "Derby Dilly," and capably executed. The same parties are applying for a place, and told by the driver, Lord Stanley, "We are quite full in front;" whilst the guard (Sir J. Graham) says, "Plenty of room behind. Now, gentlemen, please to jump up, and don't keep the coach waiting." The attitude of the coachmen is admirable; and Peel on the box is also an excellent hit; and Burdett, as hostler, standing by the horses, not less so. The other figures are well composed, and the various expression of their countenances ludicrously preserved. The last is "A Brummagem M.P.," and is a striking whole-length of that singular-looking animal Mr. Muntz, with his barbified face and capacious trews. Since Baron Geramb, there has been no such *outré* apparition upon the town; he looks exactly like a fellow to send to the north pole to fight or frighten the great white bears.

**Panorama of Macao.**—Coming events, it would seem, not only cast their shadows but their pictures before. Here, in Leicester Square, have we been, during the past week indulging in the contemplation of an admirable panorama of Macao, peering at the Chinese junk, casting a suspicious glance at very suspicious-looking opium clippers, thinking the tan-kea or egg-house boats picturesque, and wondering if there was a row how the Portuguese ships-of-war, and the English Lyra, Volage, Hyacinth, Harrier, &c. &c., would act; and lo! there comes an *express* from India which makes this very view the scene of national action, just as if Mr. Barford had painted it *expressly* for the occasion. Nothing could be more *à propos* than this new effort of the painter's art; and when we say that, besides its temporary importance, which will attract all London to visit it, as an accurate representation

of a place so peculiarly interesting at the time, it is a very beautiful specimen of panoramic effects. The shore, buildings, and mountains, are finely done; but the water is still more ably executed, and some of the boats, &c., absolute realities, and not deceptions on the canvass.

**Atmospheric Railroad.**—On Thursday, experimental trips on this new kind of conveyance were exhibited to a number of persons of all ranks, invited by the patentees to Wormwood Scrubs, where from a quarter to half a mile of it is laid down on the Birmingham, Bristol, &c. Junction Railroad. It is difficult to give an accurate description of the machinery without diagrams, yet it is very simple. An iron tube, of some ten or twelve inches in diameter, is laid down in the centre between the rails; it is made air-tight by valves at each extremity, and exhausted by a steam-engine, through the medium of a lateral tube. The machine (with its carriages attached) is then entered upon the tube, having a piston below, which completely fits and closes it, and is connected with the machine by works out of a superior groove which runs along the whole length. The weight of the external, of course, immediately impels the piston, and the piston carries the machine on with more or less rapidity as the exhaustion is more or less complete. The inventions for shutting the groove after the machine passes, and other details, seemed to be all very ingenious and effective; and at one time the train moved at the rate of thirty miles an hour. The motion is easy, and the communication apparently very safe. If a prolonged line can be kept air-tight, there can be no doubt of the success of this new mode of travelling; for we are told the cost is hardly more than a fourth of that of steam, and there are neither explosions to fear nor the inconveniences of smoke and soot to endure. We were much gratified by the experiments, though the company was far too numerous to admit of our examining them accurately, or receiving explanations on obscure and doubtful points from the engineers.

**Lectures on German Epic Poetry.**—Mr. Hirsch delivered his second lecture on Thursday. A selection from the "Nibelungen Lied," made with great taste and judgment, formed the staple of the lecture, and seemed to be very entertaining to the auditors. The poem is of great antiquity, and is remarkable for the faithfulness and simplicity with which the characters of heroes and heroines are portrayed, and the easy diction of the verse. Mr. Hirsch is a very able and pleasant expounder of his native tongue; his lectures are consequently well attended; and we are sure it is a very agreeable way to become acquainted with the peculiarities and beauties of a language which is daily gaining ground in England.

**Antarctic Expeditions.**—It is stated in the newspapers that Mr. Enderby, to whom antarctic discovery is already so much indebted, is about to despatch another expeditionary voyage under the command of Captain Mapleton. During the next three years these southern seas will be the theatre of great research; as, besides Captain James Ross's explorations, France and America are also on the "look-out" in that quarter.

**Antediluvian Child.**—This fossil, "found in a supercrity soil at Dieghen, near Brussels," is represented to be the remains of an antediluvian baby: a fact we leave to great geologists to determine. To us it appeared to be shaped like a child, with the lower extremities doubled up, or lost, and also very like a nodule

of flint of a fantastic form, not unusual in deposits of that kind in chalk. Head, neck, vertebrae, curiously resemble the human lineaments; and, with a little fancy, arms, ribs, &c. may be supposed. But, after all, it is but a grotesque flint stone, and never had either father or mother before the flood. *Terra filius*—and that's all.

**The Percy Society,** which we have noticed as being formed something after the fashion of the Camden Society, but directing its views to the publication of curious ancient ballads, and other poetical illustrations of popular manners and opinions in years long gone by, has already enrolled such a number of subscribers as to be enabled to commence its operations. Several works of interest are announced; and when we see what valuable accessions to our literature can be produced and procured by associations of this kind, at an individual expense (an annual pound) so very trifling, we are not surprised that every new plan of the kind should meet with immediate support. The Camden volumes are now worth four times their cost to subscribers, and no doubt the Percy and others will soon be in the same pleasant category.

#### LITERARY NOVELTIES.

##### LIST OF NEW BOOKS.

Murray's Encyclopedia of Geography, a new edition, brought down to 1840, 8vo. 3s.—M'Culloch's Commercial Dictionary, a new edition, brought down to 1840, 8vo. 2s. 10s.—W. B. Cooke's Views in Rome, 4to. 11s. 6d.—The Portuguese Treasure, by De Porquet, 12mo. 4s. 6d.—A Letter to the Human Race, 18mo. 1s. 6d.—Nash's Mansions of England in the Olden Time, 3d series, folio, 4s. 4d.—A Treatise on Precession, by Peter Nicholson, 8vo. 16s.—Triplicity: Essays combating Anti-Trinitarianism, 2 vols. post 8vo. 16s.—Treatise on the Sheep of Australia, by T. Southey, 8vo. 4s.—Ingli's Switzerland, South of France, and the Pyrennes, new edition, 8vo. 3s.—Dr. W. Symington on the Atonement, 2d edition, fcap. 5s.—Twenty-five Letters hitherto Unpublished of the Rev. J. Newton, 18mo. 1s. 6d.—Jardine's Naturalist's Library, Vol. XXVIII.: Dogs, Vol. II., fcap. 6s.—The Election, by the Author of "Hyacinth O'Gara," fcap. 5s.—Langstaff on Good Health and Buoyant Animal Spirits, 8vo. 4s.—A Grammar of the German Language, by H. Except the 4th, 6th, and 9th, generally clear; raining very heavily on the afternoons and evenings of the 5th and 6th.

Rain fallen, 1 inch and 165 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

Lines "To Melancholy" must be left to the enjoyment of their melancholy writer; who will doubtless thank us for this new cause of sorrowful musing.

We thank "E.E.E." but are so little at Ees for room that we cannot find space for the translated sonnets.

We have to thank the editors for the 1st Numéro of Bohain's French Newspaper "Le Courrier de l'Europe" (printed and published in London), in the sixteen three-columned pages of which we have found much to inform and amuse us. Some of the lighter papers are very *spritzelle*, and the whole affords a fair sample of a lively journal, touching upon all the topics of the hour.

"An Amateur" (Uxbridge) will obtain the information he requires by addressing the Secretary, at the Society of Arts, John Street, Adelphi.

## ADVERTISEMENTS.

Connected with Literature and the Arts.

**THE SIXTH ANNUAL EXHIBITION**  
of the NEW SOCIETY OF PAINTERS in WATER-  
COLOURS is now open, at their Gallery, 53 Pall Mall West (ad-  
joining the British Institution), from Nine o'clock till Dark.  
Admission, 1s. Catalogue, 6d.  
JAMES FAHEY, Secretary.

**THE SOUL GALLERY, No. 49 Pall**  
Mall, will be opened to the Public on Saturday, the 13th  
Instant, at Ten o'clock, and will remain open during the Season.  
It contains a few capital Pictures, lately selected by Mr. Bu-  
chanan, in Italy and France, some of which are from the Gallery  
of the Maréchal Soult, Duc de Dalmatie, and which will be ex-  
hibited in succession.  
Admittance, One Shilling.

**LAW OF MARRIAGE.—At a**  
Meeting of parties aggrieved by the existing restrictions  
upon Marriage, held at the Office of Messrs. Crowder and May-  
nard, No. 3 Mansion-House Place, London, on Thursday, the  
21st of May, a Committee, consisting of seven of the gentlemen  
present, was appointed (with power to add to their number),  
to take the necessary steps for obtaining a repeal of the objec-  
tionable restrictions upon Marriage, and more particularly that  
which prohibits marriage with a deceased Wife's Sister; and it  
was resolved, that the objects of the meeting should be forthwith  
published in such of the London and Provincial papers as the  
Committee might think proper, with a view to obtain the active  
co-operation of all parties interested.—Communications to be  
addressed to Messrs. Crowder and Maynard, as above.

**COOKE'S VIEWS IN ROME.**  
Now ready, in 1 vol. 4to. price 31s. 6d. cloth; 42s. morocco,  
**ROME and its SURROUNDING**  
SCENERY, containing Thirty large Plates, finely en-  
graved by W. B. Cooke. A detailed Account of the present state  
of Rome, and a curious Panoramic View of the City.  
Charles Tilt, 86 Fleet Street.

**HEATH'S NEW ILLUSTRATED WORK.**  
Now ready, Part III. price 8s. 6d. to be continued Monthly,  
**HEATH'S WAVERLEY GALLERY** of  
the PRINCIPAL FEMALE CHARACTERS IN WAL-  
TER SCOT'S ROMANCES, from Paintings expressly made  
by eminent Artists.  
\*\* Each Part contains Three Plates with Letterpress. A few  
India Proofs, royal 4to. are taken, price 5s.  
Charles Tilt, 86 Fleet Street.

Now ready,  
**THE PORTRAIT OF H. R. H. PRINCE**  
ALBERT, beautifully engraved by C. E. Wagstaff, from  
the Original Picture painted by Mr. Patten.  
Price: Prints, 11. 1s.; Proofs, 21. 2s.; India Proofs, 31. 3s.;  
Proofs before Letters, 41. 4s.  
London: Hodgson and Graves, Her Majesty's Printers and  
Publishers, 6 Pall Mall.

**WINDSOR CASTLE.**—The Representa-  
tives of the late Sir Jeffry Wyatville feel themselves  
bound to apprise the Public that a spurious work on Windsor  
Castle has been announced by two individuals, formerly in Sir  
Jeffry's employ as draughtsmen, with the greatest effrontery,  
coupled with the most abominable misrepresentation; more pecu-  
liarly "that Sir Jeffry confided to them the superintendence  
of the works at Windsor," the truth being that they were never,  
so employed at all; and "that they conducted Sir Jeffry's work,"  
—an assertion utterly unfounded.

**GUIDE to the CHOICE of NEW**  
BOOKS.

Now ready,  
**THE LIBRARY CIRCULAR for JUNE,**  
A Guide to the choice of New Books, with Critical and De-  
scriptive Notices. Reading and Book Societies, Subscribers to  
Libraries, Families, &c. will be furnished with this Number  
gratis and post free, on transmitting their Address to the Pub-  
lishers, Messrs. Saunders and Otley, Conduit Street.

**ILLUSTRATED GUIDE-CARDS to the LONDON**  
EXHIBITIONS.

In a paper case, containing 119 Cards, price 8s.; or 2s. 6d.  
In a box.

**GUIDE-CARDS to the BRITISH**  
MUSEUM.—It is the intention of the present Series  
of Illustrated Guide-Cards to direct particular attention to such  
objects as may most interest the young, and are best suited for  
their inspection; thus enabling them to visit these Collections  
with a purpose of lasting improvement. The plan here adopted,  
of printing a representation and description of particular things  
to be examined upon separate cards, is one, it is presumed, of  
great convenience; for it will enable parents and others to  
classify and arrange beforehand, with reference to the number of  
their party, and to direct the attention of all, in turn, to the  
more remarkable objects presented in the whole Pack, to be  
studied upon the spot, at successive visits.  
London: Charles Knight and Co. 25 Ludgate Street.

## MUSIC.

**THE MISSES ESSEX** respectfully  
announce that their MORNING CONCERT, under dis-  
tinguished Patronage, will take place on Tuesday, June 23d, at  
Whit's Concert Rooms, St. James's.

By Charles Lock Eastlake, R.A.  
Plates, 8vo. 12s.  
John Murray, Albemarle Street.

Price 4s. sewed.  
**ENGLISH CAUSES CELEBRES; or,**  
Reports of Remarkable Trials.  
Edited and Illustrated by G. L. CRAIK.

Vol. I. containing:—  
Trial of Count Kalkreuth and others, for the Murder of  
Thomas Thynn, Esq.  
Trial of Colonel Turner and others, for Felony and Burglary.  
Trial of the Rev. Robert Hawkins, for Felony.  
The Great Huntingdonshire case of Day v. Day.  
Trial of the Earl of Pembroke, for the Murder of N. Cony.  
The Case of the Ferry barge for Murder.  
Trial of Arthur Norcott for the Murder of his Wife.  
Trial of Philip Standfield for the Murder of his Father.  
This volume is the first of a Series under the Title of  
KNIGHT'S ENGLISH MISCELLANIES,  
published Monthly, beautifully printed in a novel size, which,  
whilst it admits of the great condensation and consequent cheap-  
ness which result from the prevailing mode of republication in  
large octavo, will enable the reader to use each work as a hand-  
book.  
London: Charles Knight and Co. 25 Ludgate Street.

## COMPLETE EDITION OF THE

## WORKS OF SIR E. L. BULWER.

Now ready, price 6s. bound, the New Volume for June, containing  
**The Pilgrims of the Rhine, and  
 The Student,**  
 Beautifully illustrated by Cattermole.

This Announcement in the Volume will give great and general satisfaction.

"A correspondence having taken place between Sir E. L. Bulwer and Mr. Bentley, relative to some disputed points in a former negotiation for the permission to include the novels of 'Paul Clifford,' 'Eugene Aram,' and 'The Last Days of Pompeii,' in the present edition of the author's works, Mr. Bentley has now accorded that permission, upon fair and reasonable terms. Negotiations, upon a similar footing, have also been concluded with Mr. Colburn for the same permission with regard to the novels of 'Pelham,' 'The Disowned,' and 'Devereux.' These six novels, hitherto alone wanting to the completeness of the edition, will therefore be added to it; and the series now in progress will, consequently, contain the entire Works of Sir E. L. Bulwer, in an uniform shape." The only possible objection to the entire completeness of this undertaking, and, in that, to its wide and entire success, is thus removed. Well worthy is it to hold its place beside other collections of our standard novelists of England, and there, no doubt, in every well-appointed library, it will now be found. Its circulation cannot be too wide for the excellent thought and philosophy, the just views of conduct and character, that are lastingly embodied in it, or for the delightful and untiring amusement of which it will remain the enduring source."—*Examiner*.

Saunders and Otley, Conduit Street; Simpkin, Marshall, and Co. Stationers' Hall Court; Bell and Bradfute, Edinburgh; and John Cumming, Dublin.

Price 4s.

## KING HENRY THE THIRD, Part the

First; an Historical Play, in Five Acts.

LONDON, SATURDAY, JUNE 20, 1840.

PRICE 8d.  
Stamped Edition, 9d.

### REVIEWS OF NEW BOOKS.

*The Correspondence of William Wilberforce.*  
Edited by his Sons, Robert Isaac Wilberforce, M.A., Vicar of East Farleigh, late Fellow of Oriel College; and Samuel Wilberforce, M.A., Archdeacon of Surrey, Rector of Brighthelmston. 2 vols. 12mo. London, 1840. Murray.

THESE volumes are a natural and acceptable sequel to the *Life and Correspondence of Mr. Wilberforce*, so recently reviewed in the *Literary Gazette*, as to leave us little occasion to offer any remarks upon the present continuation. We shall merely notice that the preface treats at length of the question, whether Mr. Wilberforce or Mr. Clarkson were most entitled to honour for initiating the measures for the abolition of the Slave-trade; involving, as it does, the other question, whether in the *Life*, &c. of Mr. Wilberforce, the merits of Mr. Clarkson were slighted or justly appreciated. We shall not try to reconcile the differences; being of opinion that both men deserved richly of the world for their humanity and philanthropy.

From these new letters it will be sufficient for us to make such a selection as is best calculated to shew their character, and also to interest our readers. The first is a curious one, giving an account of the impositions to which a person (whose mind is occupied with public concerns), especially a prime minister, is exposed:—

“Robert Smith, Esq. to Wm. Wilberforce, Esq.  
“Sunday.”

“My dear Wilberforce,—After I wrote last night, I employed myself in examining the first month's bills, viz. January 1785. It is necessary to know how many persons there were in his family during that time: but I can scarcely conceive a private house in the kingdom where such a quantity of provisions are charged could be consumed. It must also be recollected, that this month of January, 1785, parliament sat; and, therefore, he often either dined out, or was prevented making that meal regularly at home. Inclosed is an abstract of each week's expense, together with the general amount of the whole month. The butcher's bill only is 96*l*. Can it be possible that 3800 pounds of meat could be dressed in twenty-eight days, which (if on an average it cost 6*d*. per pound) must have been the case? The poulterer's, fishmonger's, and indeed all the bills, exceed anything I could have imagined; and the charges are in general much higher than I pay. It may appear ridiculous to speak of the expenses of my own family in comparison with P—'s; but when I have had company in the house at Hampstead for a week together, and have had every day as good dinners as my cook could dress (perhaps there were from thirty to thirty-five in family), the butcher's bill, at the highest, was 6*l*., and the baker's 2*l*. Now though P—'s bills ought certainly to be a great deal higher, yet when they come to be from 20*l*. to 25*l*. for meat only, I cannot help suspecting much imposition. The same extravagance seems to me to go through the whole. In October, when he was away the whole time, the

butcher's bill is 40*l*., and ten pounds of tea is drunk. That you may perceive the truth of these remarks, I have inclosed in another cover one week's bills, viz. the second week in the account ending January 29th, which I preferred to the first week, because that may be considered as something extraordinary on account of the queen's birth-day. You will judge whether the consumption of so much provision could have fairly taken place. I brought a book with me for the purpose of carrying on the account through the year, in the manner of the inclosed paper; but so many bills are wanting, that it would be imperfect, and Wood seems to have done them very regularly in months. I find myself much better, but by no means strong enough to encounter London at present. Mrs. Smith desires her love.—I am, my dear Sir, very sincerely yours,  
R. SMITH.”

Our next extracts exhibit Mr. Wilberforce's opinions respecting indulgence in amusements—they occur in letters to his sister:—

“Cambridge, 8th November, 1797.”

“The precise question which you put to me is of great nicety: and if it had been put to me by almost any one else, I believe I should have declined answering it in any other than those general terms which you forbid me the use of. ‘How far you may indulge in amusements without danger?’ With respect to these same amusements, I conceive no rule can be prescribed of universal application and use—none that will solve to every one the several cases which occur in life, under the very different circumstances of different men; and yet, unless we lay down for ourselves beforehand some determinate principle of action, when the time for decision comes we shall be at a loss how to proceed, and, judging hastily and under an improper bias, our conclusion will most likely be erroneous. What then is to be done? What but that every one read his Bible with simplicity of heart, that he there observe the temper and conduct our Saviour prescribes to his disciples, and then, looking into and weighing the particulars of his own state, discover how he may best acquire the one and practise the other? Where any thing is directly contrary to the laws of God there we ought to resist as stubbornly as possible. . . . Now the playhouse seems to me to fall under this description; and in order to possess you with my sentiments on this subject, I will enclose you a little essay which contains almost all I think, and will spare me the trouble of a recital. . . . but there are other diversions of a more dubious nature—balls, concerts, cards, &c. It is impossible here to judge for another; in certain situations it may be expedient to partake of them, rather than offend those with whom you may be living, &c., but not as amusements to be enjoyed, but temptations to be undergone. It is easy to see that the whole current of Scripture sets against that disposition to seek for our comforts in the vanities of life and the enjoyments of sense, which is too natural to us all: it directs us to pleasures of a more exalted kind, to joys of a superior nature; and therefore that systematic balling, and concerting, and carding, is really adverse

to the spirit of Christianity—observe, I say systematic, for it is reduced to a system: it is not an occasional, but a constant and habitual misapplication of time and money, and, what is worse than all, of affections. But then we are not to abstain from these indulgences in which the world allows itself, and value ourselves on our abstemiousness, for that will bring on a proud and a morose spirit; the true way is, to endeavour to supplant the fondness for them by the love of better things, ‘to let our rejoicing be the testimony of our conscience, that in simplicity and godly sincerity we have had our conversation in the world,’ to learn to delight in the consciousness of His protection whose favour is better than life, and in the anticipation of those pleasures which are at His right hand for evermore. Could we arrive at this blessed temper, what mankind terms amusements and diversions would be to us either tedious or disgusting; and though on some occasions we might deem it expedient to conform, yet we should do it for the sake of others, not for our own. Of all others, it is perhaps the most dangerous practice for us to draw a line, and as it were pale in some of the common amusements in which we may judge that we ought to participate from such prudential motives as I am alluding to, and then to go on in the constant use of them in unsuspecting security: the habit of mind this brings on is very destructive indeed of the vital spirit of Religion, and should be guarded against with all care. Now, were I to say, ‘You may safely play at cards or go to the Assembly,’ &c., would there not be a danger that, set at ease as it were by my permission, you would look on these, if I may say so, as fair game? In one word, then, I think the tendency of the theatre most pernicious. This is my decided sentiment, not taken up lightly, but on mature consideration. I have not leisure to state to you at large the grounds on which it rests, and it is better not to take up the question than not to do it complete justice.”

The next letter will, we think, afford some entertainment. When we look around us at this day, and contemplate the miracles of steam, we cannot laugh as they did forty-five years ago at Lord Stanhope's apprehensions of a war with France, because such inventions were likely to be made available and employed. His address to Mr. Wilberforce on this subject is a great curiosity:—

“December 5th, 1794.”
